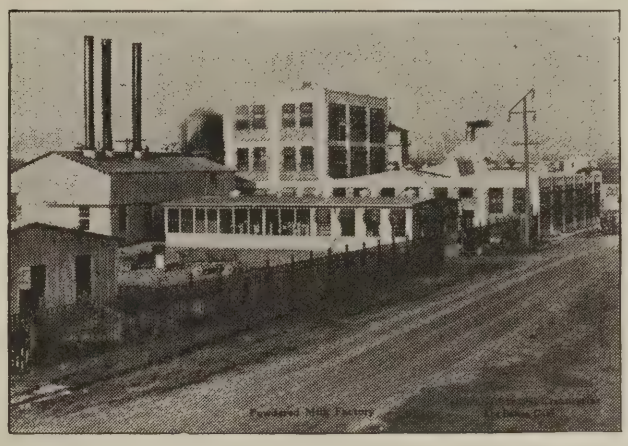
The sediment test is a simple one. Dissolve two teaspoons level full of powdered milk in one-fourth glass of water, and let stand one hour. Observe bottom of glass or tip gently until fluid almost runs out of glass. This will expose a portion of the bottom of the glass when any sediment may be seen adhering to the bottom of the glass. Or, fill a test tube, usually used in the separation of butterfat tests, with the fluid and whirl in a centrifugal for five minutes. This will throw the sediment to the bottom of the tube and its relative amount to the amount of powder used can readily be determined.

The albumin test consists of making a little pattie

Dependable

Dumores



They last a life time—as efficient when old as they were when new. Ideal in recombining dairy products and making a perfect homogeneous mass of the Ice Cream mix. Eliminates operator, mechanic, repair bills, motor and belt troubles, delays and possible accidents.

of paste with powdered milk and water. Place the pattie on a tin in an oven. If the pattie raises or fluffs up, the albumen is in its natural live state. If it lays flat and assumes a burned or charred appearance, the albumin is dead.

Powdered milk is that portion of milk left after milk has been dehydrated by any of the several processes used, and is no less milk than is evaporated or condensed milk, and has several advantages over the fluid forms of concentrated milk.

It has no bacteria action when properly packed and kept, and, containing no bacteria, is the purest form of milk obtainable.

It will keep indefinitely. It permits of a constant supply of milk at all times, both as a reserve supply and for building up the milk solids not fat content in ice cream.

It saves freight and express bills.

It allows a uniform mix, thus decreasing the losses incurrent of manufacturers, who do not test and standardize their mix.

A lack of milk solids not fat produces an ice cream of large grain, and has a tendency to be icy. An over amount produces an ice cream that, when hardened, breaks with a cleavage of dry putty, while a superamount produces an ice cream salvy and soggy in consistency.

By the following method quoted here, one may correctly gauge this amount and produce that superior, velvety ice cream, which is the desired attainment of every ice cream manufacturer.

* * *

The meeting then adjourned, and all members were requested to assemble in the lobby of the Hotel Marion at 7:30 for the purpose fo attending a theater party at the Kempner Theater, which wos thoroughly enjoyed by all present.

Dr. W. H. Woodley of the Extension Department of the State University at Fayetteville, then addressed the convention on the subject of "Dairying in Arkansas," outlining the rapid advancement made by the industry in the state, and dwelling on the natural advantages offered by our mild climate and long growing season.

Prof. A. C. Baer, of the A. and M. College of Stillwater, Oklahoma, then addressed the meeting. Professor Baer is generally considered the best informed man in the South on ice cream making, and he stressed the importance of sanitary methods in the manufacture of ice cream and expressed it as his opinion that a law requiring the pasteurization of all dairy products should be passed in this state. Such a law is in force in Oklahoma, and has resulted in inestimable good. Professor Baer's address was the feature of the meeting, and was of great value to all those who were fortunate enough to hear it.

The meeting then adjourned to accept an invitation to luncheon with the Lion's Club, at which Professor Baer gave a short talk on pasteurization.

At 1:30 the convention reconvened for a business session, at which time the following officers were elected for the ensuing year:

President—Will Terry, Terry Dairy Company, Little Rock, Ark.

Vice President—Albert Garrett, Purity Ice Cream Company, Russellville, Ark.

Secretary and Treasurer—G. A. Meyers, Grand Prairie Ice Cream Company, Stuttgart, Ark.

The following committees were appointed:

Committee to Draft Constitution and By-Laws—I. O. Hughes, Jonesboro, Ark.; F. N. Price, Russellville, Ark.; F. T. Watson, Little Rock, Ark.

Committee on Express Rates—G. A. Meyers, Stuttgart, Ark.; F. T. Watson, Little Rock, Ark.; Charles Hooberry, Pine Bluff, Ark.; Will Terry, Little Rock, Ark.

Prof. A. C. Baer of Stillwater, Okla., and Dr. W. H. Woodley of Fayetteville, Ark., were elected honorary members of the association.

A general discussion of the conditions affecting the industry was indulged in, and many matters of importance to the members of the association were discussed to the mutual benefit of all present. A resolution was presented and adopted placing the association on record as favoring a compulsory pasteurization law for dairy products used in the manufacture of ice cream.

A vote of thanks was tendered Mr. I. O. Hughes for his effort in behalf of the association, and to Professor Baer and Dr. Woodley for their able and instructive talks to the association.

It was decided to hold the next convention in Little Rock, some time during the month of January, 1923, the president to announce the exact date later.

This was considered the best convention in the history of the association, and all members were urged to be present at the next annual meeting.

Investigation since the meeting adjourned has developed the fact that the express rates on ice cream in Arkansas is considerably higher than in Texas, and the president requests each member of our organization to have his customers immediately write the Arkansas Railroad Commission, requesting them to investigate this matter, and have the rates in this state adjusted so they will be no higher than in adjoining states. This is important, and each member is urged to attend to this at once. A concerted effort on the part of every one will bring this matter forcibly to the attention of the Railroad Commission, and will result in securing better express rates.

Every member of the association is urged to take up with the state senator and representative from his district the matter of having a compulsory pasteurization law passed at the next session of the state legislature. If this is done this fall during the campaign, every member of the legislature can be put on record in the matter, and at the next annual meeting of the association our members can call on the legislature while they are in session, and can probably succeed in getting laws of this kind enacted.

Fine Work Being Done on the National Dairy Show

By W. C. DAVIS, President Davis-Watkins Dairymen's Mfg. Co.

It is surely pleasing to see how quickly the big men in this dairy industry grab hold of a live proposition. Never in the history of this business has there been so much interest developed in the National Dairy Show at this time of year. We are all getting an early start. The wheels are turning. The plans are growing, and men are working to help our splendid manager in this grand work which is bound to have excellent benefits for all of us.

W. C. DAVIS,

At Washington, our Chief of the Dairy Division, with his efficient staff of experts, is planning their part of the Show on broader lines than ever before. Chief Larson was quick to see the remarkable advantages of this thing. He appreciates just how much good can be accomplished with a larger exhibit, properly placed. Let's furnish them with the best space we have, and plenty of it.

Prof. Van Norman is also enthusiastic over this thing. He knows full well just how much this movement will help him in his work of getting the world to join us in 1923. As President of the National Dairy Association, he is in a position to help us in many ways in putting this thing over big.

Mr. M. D. Munn, as President of the National Dairy Council, needs the help and support of the rest of us. We should see to it that the good work of this "speed" organization is properly placed in exhibit right on the grounds. They are certainly doing wonderful work in helping the demand and consumption of dairy products.

Last month our meeting of the National Dairy Club, in Chicago, was the best we have had so far. It was attended by many of the influential men we have among us. Valuable suggestions and ideas were advanced by milk dealers, ice cream men, creamerymen, cheesemen and producers. All these branches of the business were represented and active in the work. They all know that a bigger and better National Dairy Show will help increase their business.

Committees are meeting almost every day to discuss this problem in real earnest. Col. Skinner is one of the busiest men in Chicago. He is most enthusiastic in this good work. It commences to look as though his "dream" is going to come true. Telephone, write or wire him your views. Perhaps you have some ideas which will give dandy suggestions. Come along and be one of us in this good work, from which you are sure to benefit.

It sure does look as though we are going to wake up those folks in the Twin Cities this year. We are guaranteed one hundred thousand visitors right out of their midst. Let's do our part in putting on a show they will not soon forget. We ought to do this thing up so good that it will double the sale of dairy products in their midst during the following months. It can be done. Our business will thrive in that part of the country as never before.

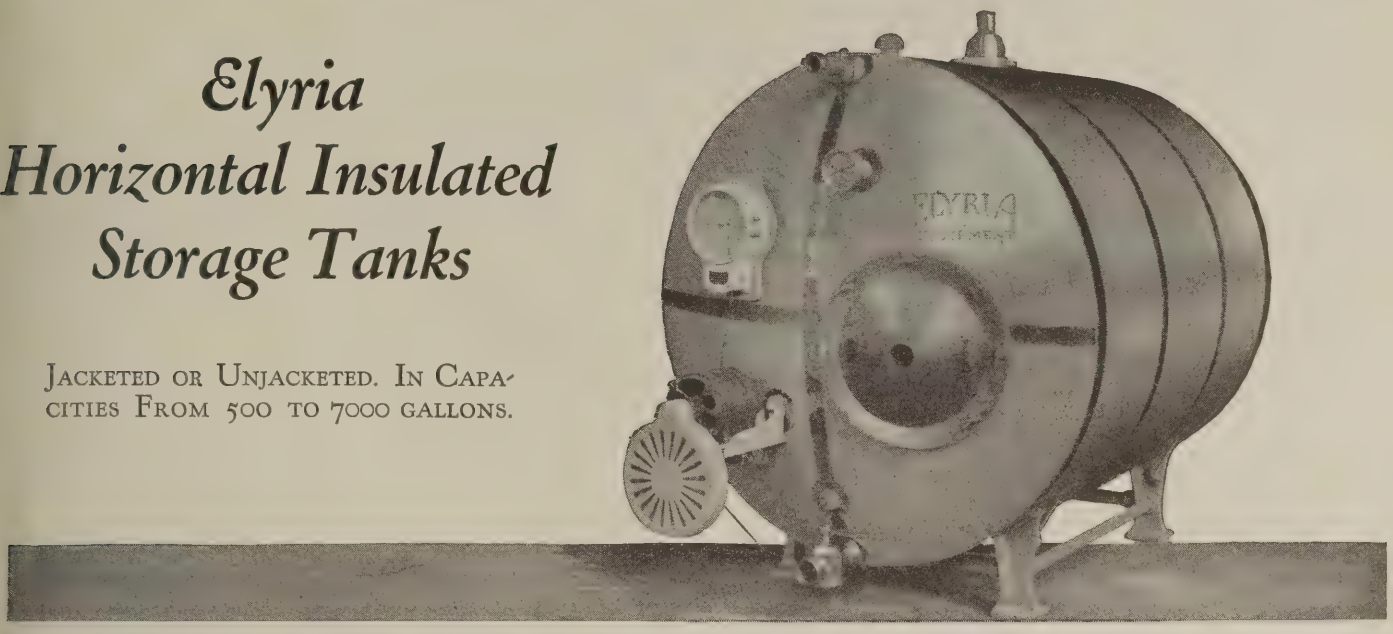
Can we get those conventions right out on the show grounds? It is important that this be accomplished. The show should be the headquarters for everything in the industry. Let the machinerymen and the breeders shut up shop and attend the meetings. Then let the conventions close shop and see the show. Some fifty-fifty arrangement would benefit all of us. Every member of any association should be provided with a season ticket. Let them come in and out as they please, with no penalty. This is easy, if they will spend their money with the show, instead of at the hotels.

Those working exhibits are being discussed in "dead" earnest. We have simply got to have them. Show people what our work consists of. This will do more to draw our common interests together, than anything else we have done thus far. The only real cause for friction is that of our lack of knowledge as to just what the other fellow does to make his work important. Let him put his work before the rest of us so we will be in a position to understand and appreciate. We need this common knowledge.

And this is the one thing city people need to be educated in. Show them that real cream is used in ice cream. That real cream is used in making our butter. How the cows are cared for, and the work and expense of producing this excellent food. Let them understand about the making of cheese, condensed and evaporated milk. Show them how milk is pasteurized, bottled and handled. These are some of the things that even men among ourselves do not thoroughly understand. Every student of dairying in the world ought to see a Show of this character. They would save and skimp to be able to be with us, and find out how these things are done.

This Show ought to be so big and complete that it would take interested people several days to see it all. How many of us right in this business saw a milking machine take the milk from the cow? And yet we are talking milk and its products every day, and making our money out of them. We think we know this business; but, how much do we really know? Such a Show as we ought to make should be worth good dollars to each one of us, from an educational standpoint alone.

If you and I really knew about cheese, the things we should know, we would surely get busy seeing that the cheesemen of America were at work on this thing. Why not take certain things for granted and get after these men and help them help the rest of us, as well as themselves. Cheese rightfully belong to the diet of every man, woman and child of this great country. The marketing of this product needs our attention.



Our associations start work on the standardization of equipment. They don't get very far, largely for the lack of the knowledge these men could get at a show of this character. Let the men on such committees have suitable opportunity to see for themselves all the ways of the work, so they can figure out correct plans which can be adopted without too much cost to anybody. This is truly one of the most difficult problems of our business. It must be solved some time, and all of us working together can do it.

We invite the dairy farmers to our Show each year. And we had a lot of them there last year. How many

A New Development in Storage Equipment

Elyria Horizontal Insulated Storage Tanks

JACKETED OR UNJACKETED. IN CAPACITIES FROM 500 TO 7000 GALLONS.

Designed to fit into any building or any system, under any conditions

Features to think about:

Completely assembled when shipped
(*Installation expense greatly reduced*)

All openings through front of tank
(*No stuffing boxes through jacket*)

All working parts in front under direct control
(*Operating and dismantling made easier*)

Sanitary lines and valves easily reached
(*Nothing under tank*)

Indicating gauge shows liquid level
(*No guess work*)

Absolutely tight insulated manhole cover
(*30 inches from floor, no platform*)

Insulated with 2" covering with light sheet iron
(*Absolutely moisture-proof*)

Finished with enamel paint and metal trimmings
(*Specify your color paint*)

Removable brass spray pipe at top, inside jacket
(*Brine and water inlet at either end*)

Brine and water lines simply arranged in headers
(*Less pipe and fittings*)

No more floor space—less head room required
(*Can be set close to rear or side wall*)

Will hold temperature longer
(*Insulation saves refrigeration when cooling*)

of these people have the active interest which would be instilled if they were to be able to take an active part in its workings? There ought to be ways and means of getting these people represented as an important part of the thing. Let dairy farmers show dairy farmers, instead of city people trying to make a whole show for them. Then we city fellows would be shown things by the dairy farmers. It ought to be a fifty-fifty proposition all around.

Agricultural colleges ought to reap a wonderful profit from such a show. It would stimulate activity in their class rooms and make easier the enrollment of students, which would put them in a position to buy machinery and experiment the right way. We certainly do need the results of this good work. Boys from these schools now make some of our best workers. Let's make it easy for more of them to get more knowledge.

I am enthusiastic about this thing because I know full well it will help my business. It will help yours. It is one of the big things all of us can co-operate in doing, from which the benefits to each one of us will be of remarkable importance. Let's go.

High Visibility.

Patron (crossly)—Say, waiter, what are these black specks in my cereal.

Waiter (after a close inspection)—Dunno, sir, unless it's some of them vitamines everyone is talking about now.—Life.

WORTH WHILE READING.

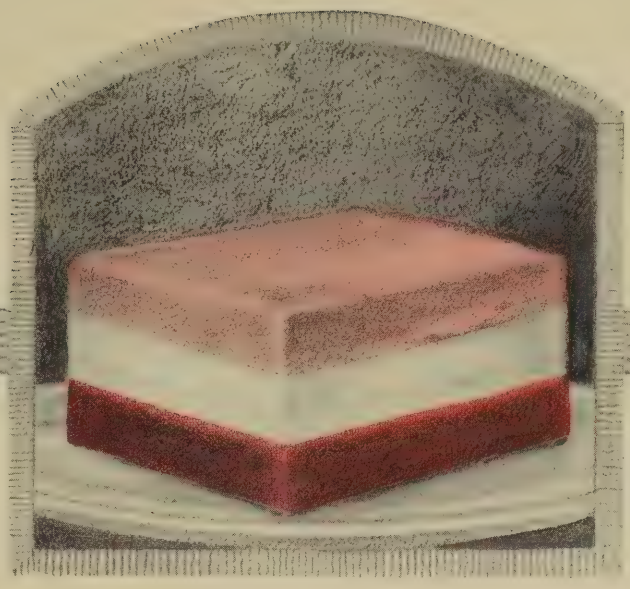
W. W. Marple's Eulogy to the Dairy Cow.

In the mad scramble for wealth and position that comes with wealth, so characteristic of the American people, we have tolerated the dairy cow only because of her revenue. I would remind you that she is a mother, and because of the fact that out of her motherhood we have made merchandise, she has become a wealth producer, but I would not forget that she is still a mother, not only the mother of her own family but the foster mother of about three-fourths of the human family, and for this we have for her a tender and sacred memory and we hold her in grateful remembrance. In India she is more than royalty. She is a God, and as such she is worshipped. She is considered as steps to Heaven—as a part of Heaven. It is not for this I hold her in high esteem. It is not alone for what she has done that I have given her so prominent a part she plays in contributing to our comfort. From the time when our eyes first see the light of day in the morning when we behold the walls that enclose our room, which is made comfortable and attractive by the plastering, which is secured by her hair, her contributions begin. We put on a pair of shoes made out of her skin, we button our clothes with buttons and comb our hair with a comb made out of her horns. We go to a tempting breakfast and find she has provided us with a plate of butter, a piece of cheese, a cup of milk, a pitcher of cream, hot biscuits made delicious with her product, a smoking hot, juicy beefsteak and above everything else, are the sweet, prattling children whose foster mother she is. We go to our place of business and fasten our important documents together with glue made out of her hoofs.

She started on her mission at Plymouth Rock and tied behind the old dust-covered emigrant wagon, hauled by her sons, she followed it to the setting sun. It was her sons that turned the first sod in this country and as she crossed the continent she picked up the straws that blew her way and converted them into milk that filled the mother's breast that nursed the child that became a ruler.

IT CAN'T BE DONE.

We wrote Mr. J. L. Rutherford, Pawhuska, Okla., and asked him whether The Ice Cream Review had pleased him during the past twelve months. He replied, "I'll say she do. Just as soon try to keep house without a cook stove as to try to run an ice cream plant without The Ice Cream Review. Gets better every issue."



McLAREN'S Real Cake (DOUBLE RING) CONES

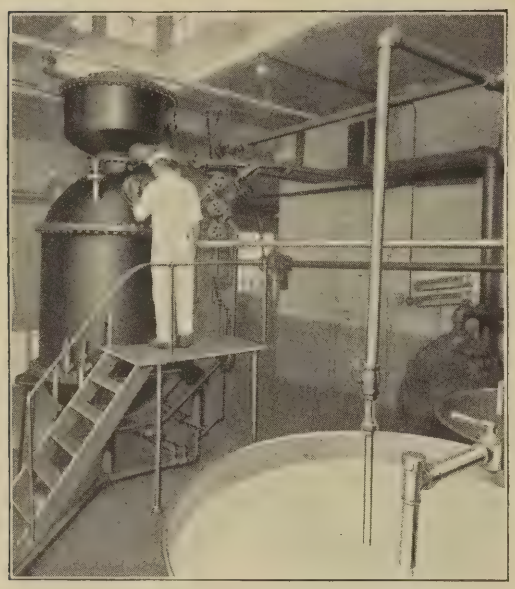
NOW PRICED EXTREMELY LOW

DAYTON OHIO

McLAREN PRODUCTS COMPANY KANSAS CITY MISSOURI

Year After Year



If you could go thru our office records and thereby discover how many ice cream manufacturers have continuously purchased B-F Flavors and Colors year after year, isn't it reasonable to assume that such a revelation would significantly impress you? Moreover, wouldn't you then more thoroughly appreciate why we guard so carefully the prestige established—why we adhere strictly and entirely to the policy of Quality at a Fair Price?

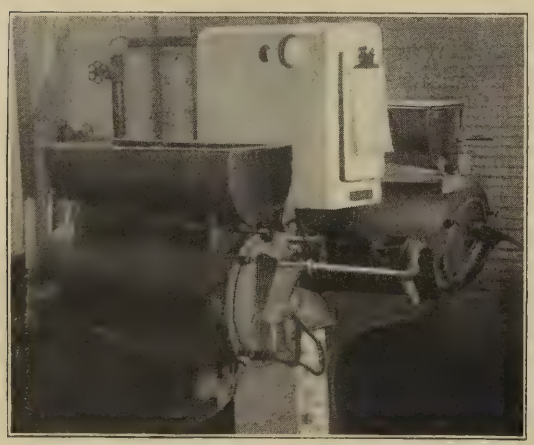
The Boerner-Fry Company

Manufacturers of High Grade Extracts

Iowa City, Iowa

Standardize Your Ice Cream

Mojonnier Vacuum Condensing Unit (5') in plant of Lawrence Ice Cream Co., Chicago. Temperature of milk never exceeds 140° either in hot wells or vacuum pan.



Standardize The Flavor In The Mojonnier Vacuum Condensing Unit

ICE CREAM manufacturers everywhere are fast recognizing the invaluable advantages of the Mojonnier Vacuum Condensing Unit. By displacing the pasteurizer and mixing tank it enables the manufacturer to make his mix from fresh milk direct from the producer and cut the cost of his mix 10c per gallon.

The Mojonnier Vacuum Condensing Unit is a scientifically designed combination of Vacuum Pan, Hot Well, Vacuum Pump, Steam Piping and Traps, steps and all other accessories necessary for a complete Condensing Unit.

Converts waste into profits by converting surplus milk into sweetened condensed milk or other condensed milk products for which there is a ready market.

Compactly built, it takes up little room. Simple and easy to operate.

Overrun Tester in plant of Decatur Ice Cream Co., Decatur, Ala. Mr. Clopton writes it is "one of the most important machines in our plant."

Write for 12 page profusely illustrated circular just off the press.

Standardize The "Swell" With The Mojonnier Overrun Tester

WITHOUT definite means of control, the "swell" or overrun in ice cream is subject to wide variation from day to day and from batch to batch.

The Mojonnier Overrun Tester enables you to control your overrun absolutely. You don't have to guess. You can test it while the cream is still in the freezer and control the factors that affect the overrun.

Each per cent of overrun represents just .4c per gallon of mix. Increase your average overrun only 10% and it means a saving of 4c a gallon, or $4,000.00 a year on 100,000 gallons. It is savings such as these that are attracting ice cream manufacturers to the Mojonnier Overrun Tester.

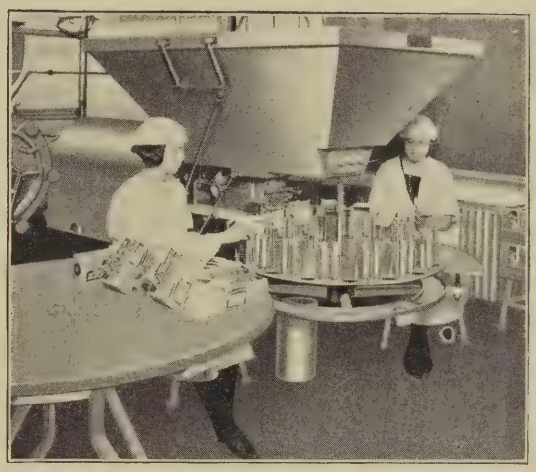
Used by the largest ice cream plants in the country: Hortons, Telling-Belle Vernon Co., Hydrox, Abbotts, etc. Also by progressive ice cream manufacturers operating two or more freezers.

Write for circular.

EFFICIENCY PRODUCTS Mojonnier

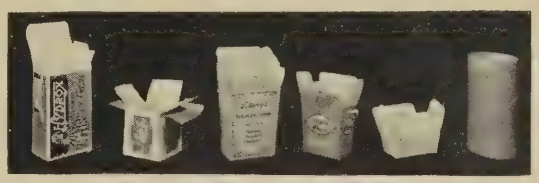
Mojonnier Bros. Co.

MILK ENGINEERS



BRANCH OFFICES: FLUSHING, NEW YORK CITY, 400 Sanford Ave. ATLANTA, 301 Bedford Place.

by the MOJONNIER Process



Standardize The Weight With The Mojonnier Packaging Machine

THE Mojonnier Ice Cream Packaging Machine is a LABOR SAVER. In one plant it reduced the labor of packaging from twelve to seven operations; reduced number of helpers from seven to three; has reduced hardenings from three to one. Eliminates pouring into molds, dipping, cutting, wrapping and exposure to heat and air after hardening, improving quality and texture of the brick ice cream. It prevents loss of ice cream and does not reduce overrun.

The Mojonnier Packaging Machine is of the measured feed type. Fills all shapes illustrated herewith—quarts to individuals—accurately. No over-weight; no air-pockets; nothing taken for granted. Fills either one, two or three flavors at the rate of twelve hundred bricks per hour. Used for making quart slabs for Eskimo Pie—no dipping necessary. Write for circular.

Mojonnier Ice Cream Packaging machine in operation at the big plant of the Hydrox Co., Chicago, where they package their entire output of one, two and three flavor bricks.

Fills any of the types illustrated above

Mojonnier Tester in plant of Russ Bros., Harrisburg Pa., where they test all the milk products that are used in the mix, and standardize the mix.

Standardize the Butter Fat and Solids With the Mojonnier Milk Tester

TO BE able to buy your raw materials absolutely on the basis of actual butter fat received—to be able to standardize your ice cream mix to within .05% and eliminate all guess work—these are advantages which you desire for your plant.

With the Mojonnier Milk Tester you can standardize your butter fat and total solids in your mix to within a few hundredths of one per cent. Thus you can control all of the ingredients—butter fat, milk solids (not fat), sugar, gelatine, etc. If your ice cream maker gives your laboratory analyst a sample of the complete mix at 8 o'clock, in just forty minutes the operator can tell him the exact butter fat and total solids content in the mix.

The Great Hydrox Company advise that the Mojonnier Milk Tester pays for itself every month in the flush season.

With the Mojonnier Milk Tester, you can test, check and absolutely control the factors entering into your overrun. And that kind of accuracy pays big dividends. Write for circular.

THE WESTERN MARYLAND CITY DAIRIES HAVE DEPARTMENT OF PUBLIC RELATIONS.

The Western Maryland-City Dairies, of Baltimore, have retained J. Hampton Baumgartner, head of the Baumgartner Advertising-Publicity Company, of that city, as director of public relations and also to handle their advertising account.

It is believed that this new policy of the Baltimore milk distributor of co-ordinating its advertising and other matters relating to contact with its patrons and the general public under centralized direction is a forward step in placing the dairy industry upon the same plane as other public servants.

Mr. Baumgartner's connection with the Western Maryland interests carries with it an executive association, for in addition to handling the advertising account he will serve as an advisor to the executives in matters relating to good will, sales development and personnel. His training has been along these lines, as for several years prior to entering the advertising agency field he was director of publicity of the Baltimore and Ohio Railroad System, attached to the executive staff.

The recent merger of the Western Maryland-City Dairies makes the new company the largest distributor in the Baltimore market and one of the larger American dairies.

Irvin D. Baxter, former proprietor of the Western Maryland Dairy, and Asa Bird Gerdiner, former president of the City Dairy, are chairman of the new board and president, respectively, of the new company.

Recognizing that the continued growth of its business will depend largely upon public good will, supported by quality of its products, and good service, plus a comprehensive understanding by the public of the service performed by a dairy, and a thorough knowledge of its methods of doing business, a decision was reached to make its activities an open record and seek the co-operation of the community. In this decision Messrs. Baxter and Gardiner were given the unqualified endorsement of the directors of the company.

An instance of the company's interest in public affairs was apparent at Christmas time when a letter, signed by President Gardiner, was distributed to 2,500 poor children, entitling the bearer to a quart of milk from any delivery wagon or store selling the dairy products. The children were entertained by the Baltimore Advertising Club at a Santa Claus party. Baltimoreans termed the charity a practical illustration of the fact that the "milk of human kindness" flows in corporate organizations. Many of the larger families represented by several children received a week's milk supply free of cost.

Mr. Baumgartner is getting in touch with dairies throughout the country incident to a study of the new work. He will later give the trade the benefit of experiences in articles contributed to this publication upon phases of the business coming under his supervision.

LICKING CREAMERY CO. CHANGES NAME.

The Licking Creamery Company, with executive offices at Newark, Ohio, and branch offices in New York, N. Y.; Jersey City, N. J.; Philadelphia, Pa., and Wheeling, W. Va., has changed its name to The Davis Company, on the Third of March, Nineteen Hundred Twenty-Two.

There is no change in the officers, management or policy. This company manufactures butter, ice cream and handles market milk.

PURITY THE ORIGINAL PAPER CAN

—with the famous "locked crimp" top and bottom construction

FOR USE

1. In conjunction with Automatic Ice Cream Packaging Machines produced by Mojonnier Bros. and other manufacturers of creamery equipment.

2. As a sanitary package filled direct from the freezer.

3. As a "carry-home" sales builder by supplying your dealers with them.

Made in capacities from quarter-pint to half-gallon.

The PURITY PAPER VESSELS COMPANY
BALTIMORE, MD.

The Age of Large-Scale Enterprise—and Advertising

By F. B. WILLIAMS of Nordhem Syndicate Service

OUR grandfathers didn't use soap that was put up at factories hundreds of miles away. They used the soap that their wives made at home.

Nor did they eat for dessert ice cream that was delivered to their door by some one who manufactured ice cream wholesale. Ice cream was a rare and unusual dish—and when it **was** served it was frozen, with much effort and patience, at home.

When grandfather picked up the newspaper of his home city he found it strictly a "home talent" paper. The news articles, the editorials, the jokes—all were written by local men for that particular paper alone. For an evening journal in Baltimore to carry the same "funnies" as an evening journal in Boston—and on the same day— would have been as unheard of as it was impossible.

And when some special event occurred in a distant place, the smaller town papers had to wait for their accounts of it until they could copy it from the big city sheets.

Nationalizing Mutt and Jeff.

But what of the papers nowadays? The homely faces of Mutt and Jeff are as familiar in San Francisco as they are in New York. Mr. Barnes, of Wisconsin, is reading the wholesome advice of Dr. Frank Crane at the same time that Mrs. Johnson is reading it in Philadelphia; and the day after a big sporting event the Associated Press account of the affair appears in hundreds of papers all over the country.

Today we would consider the newspaper our grandfathers read pretty much of a one-horse affair.

The point is that grandfather lived in an age when each individual did an infinite number of things for himself; we live in an age when things are done on a large scale under centralized management—and each individual shares in the results of the large-scale effort.

Advertising's Infancy.

Advertising, one of the mose recent of the world's enterprises, has followed almost exactly the course of the newspapers. We all know, of course, that not so very many years ago anything worthy of the name of advertising was practically unknown.

Then the pioneer advertisers, naturally, "wrote their own." Why shouldn't they? Thew knew as much about the matter as did anyone else—for there were no trained advertising specialists when advertising was young.

The ice cream manufacturer, for instance, took a few minutes spare time and wrote "something to go in the paper" about his ice cream. Perhaps he paid a small price to a nearby young sketcher to make a few drawings to go with this something—and to the local sign painter for painting some bulletins portraying his cream as the best.

All very well. It may have been excellent stuff, and no more to be criticised than were the delicious home-made desserts which Grandmother gave to Grandfather.

Farewell to the "Home-Made" Age.

But the modern trend of things has shown that home-made advertising is no more necessary than is home-made ice cream. Like using a small hand freezer, it can be done, and frequently can be done well—but it isn't necessary, and it isn't the most economical and efficient way of doing things.

Just as Bud Fisher proved that Mutt and Jeff were as much at home in the West as in the East; just as Dr. Frank Crane's philosophy is as true for Chicago as it is for Savannah; just as a whole new world of effective news-telling was opened by the Associated Press, so is the modern manufacturer finding that a brand of ice cream made in Podunk, Iowa, can be kept in public attention perhaps more forcefully—and surely much less expensively—by advertising material prepared in, let us say, New York or Chicago, than by advertisements prepared "right on the ground" in Podunk.

The ice cream man is learning that in these days of centralized big-scale production advertising is not lagging behind.

"Big-Town Stuff" at Small-town Prices.

It is easy to see that a newspaper of the average town could not afford to pay Bud Fisher many hundred dollars each day for the doing of Mutt and Jeff; but since Mutt and Jeff are "syndicated," their daily cost is divided among almost innumerable newspapers, and the small paper of very moderate means can afford to give Mutt and Jeff to its readers.

It is equally easy to see that the average ice cream man—even the "big" one of a city—can't afford to pay the prices demanded by skilled artists and writers for the advertising designs and ideas that are to sell his cream.—or to pay the necessarily high rates of lithographers and printers for the production of his advertising material in comparatively small quantities. But divide these costs among many representative manufacturers all over the country—and presto! the problem is solved.

The syndicate idea in advertising is simply a normal and logical part of our present age of specialization and large-scale production.

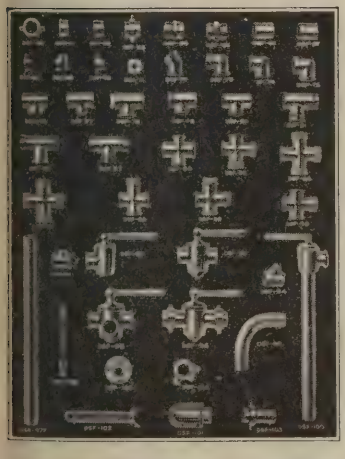
Davis Pressure Bottle Washer

Davis Milk Bottle Filler

Dairymen's Cotton Strainer



IN ALL big industries there is one dominant concern which stands out prominently in each branch of it. In the machinery branch of the Dairy Industry, the name "Davis-Watkins" is the first name coming into the average mind when machinery is mentioned.

Likewise the trade name of this great organization is the first one you think, when a machine for a particular operation is considered. If it is churns—you think "Disbrow." If it is pasteurizers—you think "Davis;" just as you do on bottle fillers, cappers and washers. If ice cream freezers or homogenizers, it's "Progress." And, everybody knows that "Dairymen's" milk and ice cream cans are made in the factory of Davis-Watkins. Likewise, they have made popular the names "Economy" and "Minnetonna."

Whenever you buy any machinery or equipment bearing one of these trade names, you may be sure it is Davis-Watkins made. Each trade name characterizes the real satisfaction you are sure to obtain from the machine. It has taken many years to build up the trademark value of these names. They represent true value and must be protected. It is the mark of distinction, on each Davis-Watkins machine, which indicates just how sure you may be of its honest value.

PARCHMENT PAPER IS A GOOD PROTECTOR.

Cooperage Business Four Decades Ago

THESE are the days of prohibition, and we expect you are questioning why we put before your eyes this big cask which would hold 10,000 gallons of beer—but then you know, there is always the "home brewer" who may be interested—that kind of cautious man we all know of who always insists on his friends sampling his home brew before he will take a chance.

But all things come to some kind of an end, just like the Lenten period, for instance, with its Ash Wednesday, Shrove Tuesday, Good Friday and Nut Sundae—and the bar business has passed away too, taking with it the cooperage business in that line—but behold! It has been supplanted by the great ice cream industry, and in a very efficient manner, and the cooperage business is now doing a thriving business in this growing line. They say you can't hold a skyscraper on a faulty foundation—you have to attend to the foundation first. We might add that the cooperage business plays an important part in the foundation of the ice cream industry, for is it not to the advantage of the manufacturer to recognize the true importance of the ice cream tub? The ice cream man is coming into his own—John Barleycorn is dead—on every hand there is a distinct change in the air—the rasp of uncertain steps has gone from the pavements—hats are worn straighter, collars are all in place now on the avenues, now that prohibition is with us. And the cooperage man has swung his industry to ice cream cabinets; he is in line with the optimist who used to carry the corkscrew and now carries a tin spoon.

The accompanying photo is of a large beer cask displayed in the Elks' parade in Louisville, Ky., in 1902. This barrel and twenty others were shipped to the Iron City Brewing Co., of Pittsburgh, Pa., and were used to store and age beer. Each cask held 2,560,000 glasses of 8 ounces of liquid. The life of these large casks is indefinite—some of the large barrels have been in service thirty-six years and are still giving satisfactory service, (but are serving a different industry.)

At the Columbia Exposition in Chicago, Ill., in 1893, the Gambrinus Cooperage Works, of Louisville, Ky., received the highest award on tanks—and ice cream packing tubs are nothing else than a small tank. Mr. Philip Sengel, the founder of the Gambrinus Cooperage Works is still actively engaged in this business. He is a practical cooper, having learned his trade across the "pond." Being of the old school, he is a believer in quality rather than quantity. He can be found in the plant any day constantly watching the product from start to finish to insure the highest quality. First-class mechanics are employed, some having been with this company for thirty years.

The ice cream tub goes through quite a process before it is turned out into the finished product. After the timber is thoroughly dried, it is taken into the large plant where each piece is inspected to eliminate defects; next it goes to the lathes where the staves are jointed, equalized and matched, tongued and grooved; from there they go to the set-up men who set them up or form the tub; they are then placed on the lathe where they are automatically turned off on the outside, sanded and one hoop driven in; they are next chucked or turned out on the inside, sanded and crozed for the bottom; from the lathes they pass through an inspector's hands who gives them a very rigid inspection. Each tub is then geometrically measured for the bottom and a bottom made for that particular tub. This is done to insure a perfect fit. The bottom is next put in, the croze first being painted with nitrogen black, after which the balance of the hoops are put on. The tub is then ready for the paint shop, where they receive two coats of tub enamel, handles put on, drain hole bored and the tub is then ready for shipment.

The Gambrinus Cooperage Works turn out approximately three cars of tubs each week, and prohibition hasn't hurt the Gambrinus Company even if it has made this part of the world "flat" instead of round.

The company was established in 1877.

NEW RECORDING THERMOMETER.

Another new recording thermometer has recently made its appearance on the market. This instrument is manufactured by the American Steam Gauge and Valve Mfg. Co., of Boston, Mass. It is interestingly described in a new folder which has just reached our desk, and which, no doubt, the manufacturers would be willing to send to those interested.

Unlike some recorders, this new "American" product is actuated by different methods, depending on the purpose for which it is to be used. Either saturated vapor expansion, inert gas or other liquids are employed.

It has an ingenious chart button which permits of removal of the chart by giving the button a quarter turn, and prevents loss of the button. A pen lifter automatically raises the pen from the chart when door is opened. Other features are also worthy of note.

ECONOMY IN STRUCTURAL INNOVATIONS

If the great progress made in ice cream and dairy plants within the past several years were to be summed up in a few words, *"Structural Innovations"* would adequately describe it. In fact, the wonderful improvements in present-day plant buildings are the results of numerous innovations developed and perfected by those who are continually striving to improve, combine and concentrate the various efficiency agents through the media of research, ingenuity and experience.

Plant owners are recognizing this condition as never before, and they are seeing the wisdom of investing in those factors which assure them of a modern, durable, efficient and economical plant.

If you contemplate the erection of a new plant, or the modernization of your present one--if you are interested in knowing how you may apply the same principles of modern architectural and engineering practice which have made

Mc CORMICK

ARCHITECTURAL and ENGINEERING

SERVICE

plants so efficient and economical, we will be glad to give you full information upon receipt of your request.

Regardless of the size of your plant, the cost of McCORMICK SERVICE is more than made up each year through the innumerable economies effected.

Possibly you do not contemplate plant improvements at this time but at some later date. You shouldn't wait, however, to get complete data relative to the application of McCORMICK SERVICE. You will not be obligating yourself in any way whatever.

PAPER VESSELS ARE POPULAR FOR SANITARY CONTAINERS.

Illinois Association of Ice Cream Manufacturers

Proceedings of the Twenty-second Annual Convention held at the Sherman Hotel, Chicago, December, 6-7, 1921

(Concluded from March Issue)

Chairman Courtright: The next on our program is "Illinois Food Laws," by the Hon. A. H. Jones. Mr. Jones' name is on the program, but in his place Lieut. Col. Clyde Miner will speak. Mr. Miner is also of the Food Department of Illinois. (Applause.)

Mr. Miner: Mr. Chairman, ladies and gentlemen: I am sorry that the superintendent is not here. He, being a lawyer, could entertain you very well on the food laws. What I have to say is not very much, just a few remarks.

A short time ago there was quite an excitement about raising the standard of ice cream from 8 to 10 per cent in the state of Illinois. But some way or other it didn't go through. I myself can see where it was quite a harm to the ice cream industry not to have that 10 per cent standard in the state of Illinois—for several reasons. It doesn't affect many of you gentlemen that are in the manufacture of ice cream that are here today, but we do get to people in the division of foods and dairies where it would be a great benefit if we had that standard of 10 per cent instead of 8.

Along our sanitary food laws we have quite a little complaint about the way our inspectors use you people. Now an inspector comes into your plant and inspects it, he finds some things that don't correspond with the law. These laws are made to enforce and it becomes our duty to try to enforce them, and I think you will all agree with me that we have been fair with you in trying to enforce them. This inspector on his report must put down there the conditions found. Further down in his report is a recommendation. He makes a recommendation. If you haven't got your place screened or sufficient drainage or something of that kind he says to you, "Mr. Smith, how long do you think it would take you to screen this door? Would five days be enough?" If you didn't think it was, you might say ten. And he puts down ten days here to comply. That report comes into the office and you get a registered letter to that effect, comply with that recommendation within ten days.

Now at the end of ten days he is supposed to go back thre and make a re-inspection. Possibly he doesn't get there for six months. At the end of six months he comes there and finds that the screen door hasn't been touched. Now that is not the proper way to do. All we ask you to do is to comply with the law, just as nearly as you can, and we will give you all the show in the world, but if we find a party that isn't trying to comply, doesn't make any effort to comply, then we must act.

Mr. Luick: Would you be able to tell us how ten average ice cream plants will compare with ten average creameries, or ten average cheese factories?

Mr. Miner: I would say at least just as good. I am a creameryman myself by trade.

Mr. Luick: Just honestly speaking, man to man, would you say fully as good?

Mr. Miner: The big concerns, yes.

Mr. Luick: I am speaking of ten average plants, that is taking in big creameries and small ones, big cheese factories and small ones, big ice cream plants and small ones; I am merely asking you the question whether they would stack up favorably against ten of either cheese or milk?

Mr. Miner: Yes, I would say they would.

Mr. Schwindeler: I am mighty glad to hear that we are making such good ice cream in the state of Illinois, 12 to 13 per cent. But I do think in the inspection department of the state of Illinois that we are still just a little bit lax, not in the inspection of the bigger plants, they receive their inspection regularly, I don't want to criticise the gentleman there, either, but I still can't understand how any man who makes his own ice cream, a man or anybody else can make his ice cream down in a basement and still get by, and we are still doing it in the state of Illinois.

Mr. Miner: I would like to answer that in a way. The division of foods and dairies have about 35 inspectors to take care of ten laws and travel this state from beginning to end, every little nook and corner there is in the state of Illinois. Under those circumstances, it is absolutely impossible to get to everybody; we cannot do it.

Member: Why not inspect them when the license is applied for?

Mr. Miner: We make those inspections. If a man sends in an application for a license the inspector for that territory immediately goes there and makes that inspection for you.

Member: Then if that inspector gets there and he finds the man applying for that license is making his ice cream in a basement, without any regard whatever for sanitary conditions, does he still get a license?

Mr. Miner: He gets it if he is O. K'd by the inspector, yes.

Mr. Schwindeler: That is the point I was trying to

THE SCHOTT BROS. COMPANY

"If Made from Canvas We Make It"

WEST SALEM OHIO

bring out, that licenses are granted too freely in the state of Illinois.

Chairman Courtright: I agree with you and I fear that the department hasn't taken the right use of the income from our licenses. As I understood the license proposition was to furnish money to supply sufficient inspectors to make proper inspections.

Mr. Schwindeler: I believe you are wrong there. It is to furnish money. As far as the license fee was concerned, the way I understood it, and I had considerable to do with the framing of that bill, was that it would give the inspector an absolute list of every ice cream manufacturer, everybody who made ice cream. At the beginning of this inspection law a notice was sent to every ice cream manufacturer, every large manufacturer anyway, with a request that he send in the names of everybody making ice cream in his immediate vicinity. In that way an absolute check was made on everybody making ice cream. But I do claim that today in the inspections in the various cities that the big manufacturer gets inspection all the time and the little fellow is slipped time after time.

Secretary Loewenstein: I believe Mr. Schwindeler was president at the time this thing came up, and he and I had it under consideration a great deal. He spent some time in Springfield during that session of the legislature, and I spent a great deal of time. Mr. Newmann was superintendent of the food department at that time, and Mr. Newmann and I worked on that bill and got it through the legislature. We not only did that, but we also got the appropriation committee to appropriate enough money for nineteen additional inspectors,—I believe that was right, wasn't it, Mr. Miner?

Mr. Miner: Yes.

Secretray Loewenstein: Those 19 inspectors were for the purpose of taking care of this license law to provide inspection and for other purposes for the food department. We thought that we had gone a long way on it, not only getting the bill through, but also in getting the appropriation for those additional inspectors. We got that through at the very last minute of the session. In fact, the bill was jammed several times. It seemed that some of the druggists, etc., were opposed to the bill. We originally had it that it was to be $20 for wholesale manufacturers and $5 for retail manufacturers, and at the request of the sub-committee of the house that handled the bill, the agricultural committee, it was finally changed to $10 and $1, and we got the bill through in that manner. But it is absolutely true, as Mr. Schwindeler states, that the department is not making an adequate inspection of the plants, and the purpose for which we fought for this bill is not being accomplished. The situation is the same as it has been. The large plants are being inspected and the smaller ones, who are really requiring the inspection, are not being inspected. The primary object of getting the bill through was to eliminate the dirty basement factory where there is no light, no ventilation, and those are the plants that seem to be thriving and going along just the same as ever, making ice cream under dirty, filthy, unsanitary conditions, and those are the plants that should be driven out of business or corrected; and it seems the inspectors don't find those places any more now than they did before, and the result is that the law is not operating as it should. The only ones that are inspected are the large plants. The reason I can say that is because I have had several requests from members asking why a certain plant in a certain town hasn't been inspected, and I know that to be a fact in a great many instances, and they are the ones that they should look up, they don't seem to locate them, and those are the fellows that should be corrected, and if their place of business is in such a condition that it cannot be corrected, they should be made to quit.

Mr. Woodhull: Although an outsider, in a sense, I cannot refrain from just saying a few words, and perhaps I can leave a suggestion with you that may be beneficial in these premises. The licensing of ice cream manufacturers in the state of Illinois, the law under which they license, adn the basic principle of that law is to supply the state of illinois with sufficient funds that it may exercise its police power in safeguarding a product which has to do with the life and the health of its citizenship, and the right to exercise the police power, either by the state, the nation, or the city or the village, is unquestioned, and you know we have no constitutional right when the police power is enforced.

I mean by that, this, if you have a child in your home and it has the small pox, you say it is your home, it is your sacred precinct. Under the Constitution of the United States they cannot enter it. But if in your home there is a contagious disease that jeopardizes the life of your neighbors, you have no constitutional right, you function for yourself, the state comes, or the city or the village, and takes that contagious disease and removes it and takes your child out of your home. So the police powers are very broad, and the license fees that can be assessed under police powers are such funds as are necessary for that law to function. Therefore it is obligatory on the part of the officials of the state and when I say officials I mean legislators, to provide sufficient moneys to safeguard the life and the health of the citizens of the state.

Now we must not overlook the element of politics that enters into all our government, in every channel. We must be practical. I assume that in your endeavor, Mr. Secretary, this organization's endeavor, to cause to

be written into the law a sum for license, the reason that it was reduced was because those who were engaged in a small way in the manufacture of ice cream, in the parlance of the street, "trimmed you." Their influence with their senators and their representatives was greater than yours. So it brings me to this conclusion, that if the manufacturers upstanding in the state go on record again, as they have in the past, that they want to supply the necessary funds to do this thing in the right sort of way, and exercise that police power and safeguard the public, that those who are interested in the sale of ice cream who are not engaged in the manufacture of ice cream are interested with you primarily, we will say selfishly, if you want to put it that way, because we cannot overlook that element; they should be interested with you in seeing to it that the competitor who manufactures ice cream is compelled to comply with the same conditions under which you manufacture ice cream, and which is taken into consideration when you price your ice cream to him.

In other words, he pays you for an ice cream that is made under proper conditions. He is called upon to compete with someone else who manufactures ice cream under improper conditions. If you can get that thought to him and get every retailer of ice cream in the state back of you and show to him where it is to his interest to have this proper inspection, then I think the political phase of this problem will be solved, and when you go before the next legislature and before the next appropriation committee and say to them, "We want to provide the money to exercise this police power, and we want these inspectors, and we want you to make a specific appropriation for those inspectors," then if they make such an appropriation, that money must necessarily, under the law, be spent for such inspectors, and then, with the proper co-operation of this organization, and the department, whom I am sure want to do it, it seems to me you ought to get results. I thank you.

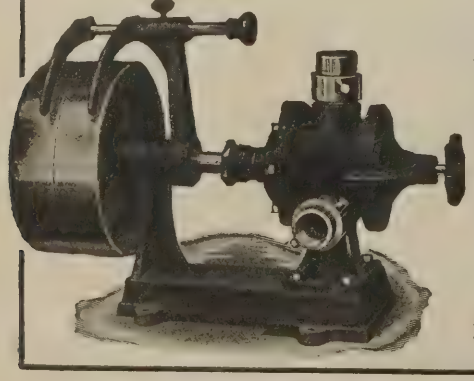
Chairman Courtright: Alderman Woodhull, I believe that you have that proposition a little bit wrong. As I understand it, in the state a license law providing a certain revenue, that revenue from that law must go into the state treasury and cannot be used for any specific purpose. I believe you can do that here in the city, but I cannot do that under the state law; that is, that the money goes into the state treasury and the appropriations that are made for inspectors, or for any other purpose, are separate and distinct. Of course, it has some effect on the legislature as to the amount of revenue you are getting from a specific statute or license law as to the appropriations they make for the enforcement of the law.

Ald. Woodhull: But when this Department of Agriculture goes before the appropriation committee of the legislature, they make a specific statement as to their requirements, else a budget couldn't be compiled. Every department, I take it, must be called upon to submit to the appropriations committee their requirements for the coming year. They set up their budget when they get that information—"we require so much money for this and that, and the total requirements of this department are so much." Am I correct? All right, then, the appropriation bill when finally tabulated carries in it a total item which was arrived at through the itemized accounts of the respective departments, in which itemization of this respective department you find so many inspectors, which carries with it the moral obligation in the proper expenditure of that money to employ those inspectors, and if there is a civil service law in the state of Illinois and they pass an appropriation bill that carries with it nineteen inspectors, and those men are on that list, even if they are not employed in the act of inspection, they have a civil service standing, they are subject to call, the money has been appropriated, and they can go into court and get their money even though they are not employed.

Secretary Loewenstein. What I meant, Alderman, was that the money derived from the revenue, that is, from the license fees, has no direct bearing on the spending of it, that is, the appropriation for inspectors.

Ald. Woodhull: I am citing to you this, that the state has the perfect right to collect enough money to take care of the police enforcement in the state, the exercise of the police power. The state has a right to levy a license to do that work. If you say we are ready to pay that license, and you have the support, and the license is set, the appropriation made, the department includes in their itemization so many inspectors; it is incumbent, then, under the law, to put on the inspectors, and they can only then fall down in not properly functioning under the head of the department, and for which that head will be responsible.

Mr. Credicott: When you speak about appropriating or furnishing enough funds to carry that on, I am wondering where that is leading to. How many ice cream manufacturers have we. How many licenses were issued?



Mr. Minor: I think something like eleven hundred.

Mr. Loewenstein: That includes retail as well as wholesale. You don't know how many wholesale, do you?

Chairman Courtright: Three hundred forty-two I think he said.

Mr. Credicott: When you come down to the final analysis you cannot increase the license on the small

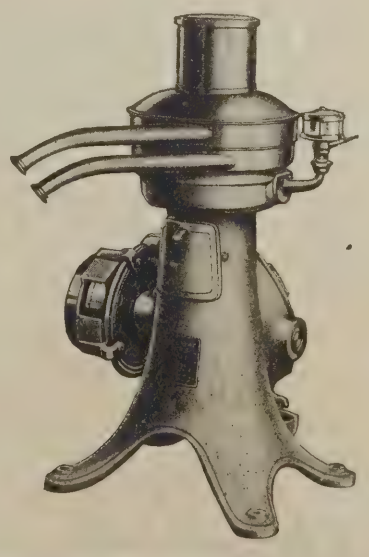
PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS

When a rush of business finds you short of cream —

you would probably be glad to pay double price for enough of it to meet the demand. At other times you would have liked to sell your surplus cream at half its cost.

You can insure yourself against loss of profits due to such conditions and can improve the quality of your ice cream by installing a



De Laval Emulsor

Cream produced by the De Laval Emulsor differs from any other so-called emulsified or homogenized cream that you may have seen or used, because it is just natural cream. There has been no change in the constituent parts; the butter and skim-milk that have been taken apart and stored are simply put together again by a mechanical process.

The result is sweet, normal cream that whips and swells the same as the best "raw" cream. Better ice cream can be made from De Laval emulsified cream because it is pasteurized during the process of emulsification and the flavor is improved by thorough aeration.

Users state that the De Laval Emulsor not only makes it possible for them to produce better ice cream, but that the cost per gallon is materially reduced by the Emulsor.

If you want to provide for your cream requirements in the most economical manner you will be interested in reading our Emulsor Catalog and Book of Testimonials. Write for them today.

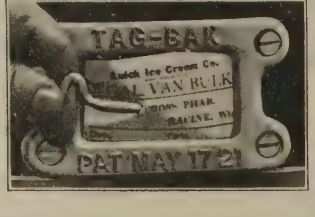
manufacturers very much. You might boost it up to five dollars. If you are going to raise the funds to do the inspection work and do it properly you will have to get most of it from the large manufacturers. If you will do a little figuring on the expense of keeping out inspectors, their traveling expenses, etc., you will see it is going to run into a lot of money. I have never believed in the license law as a means of controlling that thing. This association was induced to back up the license law by John Newmann, then the superintendent of the Department of Foods and Dairies, on the one proposition, the idea that it would do away with these basement plants that you have been talking about. That was why we backed the thing.

Now, gentlemen, never in the history of this country has it been possible for any group of business men to force other groups of business men out of business by legislation. It is a case of the survival of the fittest. The only thing that you can hope to do on this is to have an inspection force that will work and enforce the laws that are written on the books.

The license—the only real reason that I can see for a license, and I believe it is the only thing that will justify it, is the idea of giving the department a list of these people, so they know where they are at. It also gives them a weapon. That was the main reason why John Newmann came before us at the meeting at Rockford and asked us to back this law, was that he would have, in the cancellation of the license, a weapon far greater and more potent than any regulation in regard to sanitation or anything of that kind; that with these regulations on the books and the power to revoke the license, he had the power to absolutely control the industry.



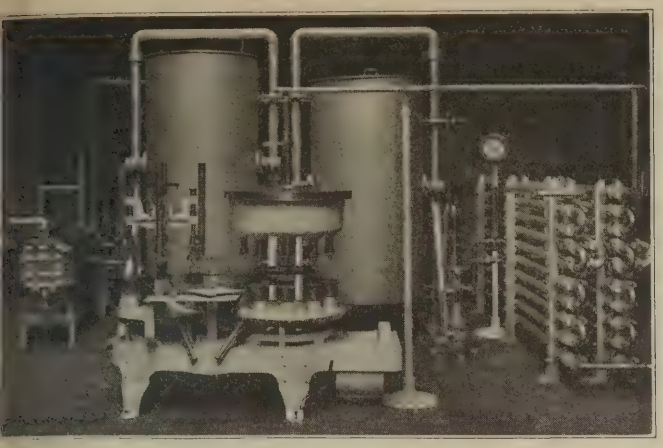
I was not in favor of the license law at that time. I have had a little experience as an inspector. At one time I was an inspector on the dairy and food force of Minnesota. I know a little bit of how this inspection force works out, and I was not in favor of the proposition at that time, but the majority were in favor of it, and I said nothing. To my mind the license proposition is just a nuisance; it doesn't amount to anything; the amount we have to spend doesn't amount to much, but if you were engaged in a varied line, as I am, making ice cream, manufacturing butter, handling eggs, and you have to take out a license for everything, a license for every egg buyer, a license for your main plant, for every cream buyer, and a license for the ice cream, it keeps you busy half the time checking up on the licenses and keeping them properly taken out.

In this inspection proposition, gentlemen, it will be just what we make it. When we talk to the department as we have been talking now to Col. Miner, we show that we don't approve of the way the thing is being enforced; we give him good, sound reasons therefore, we are not kicking on it because it has hit us in some particular case, but that the way the thing is enforced is not in line with the thought and the intent of the law itself, then we are going to get somewhere, but until you get the public sentiment back of the department to force that sort of thing, what are you going to get for your force of inspectors? You are going to get fellows that are in there because they have a political pull.

Now, primarily, what are they brought there for, and who are the fellows that are trying to get in there? Mostly the fellows that have a political pull somewhere. The inspectors in this state, with very few exceptions, Col. Miner is about the only man on the Illinois Dairy and Food Force that knows anything about the dairy business at the present time. There is none of the inspectors that I am acquainted with that know anything more about it than they have picked up since they became inspectors.

I was down in the office of the superintendent one day about a year ago to see him on a matter. There was a man in his office who had recently been appointed an inspector and he had a bunch of books they had pulled out of the library for him to read up on the dairy business to equip him to go out as an inspector amongst the creameries and the ice cream plants in the state. He had been looking them over and finally he shoved them back to the superintendent and he said, "I guess I have got everything out of them I need." Just then the superintendent was called out, and that man and I sat there together in the office a few minutes, and he turned around to me and commenced to talk. Gentlemen, I wish I could remember some of the questions that he asked me about creameries and milk plants. It was absurd, it was ridiculous, it was a joke; why the man didn't know anything about it, he was absolutely ignorant about the whole business. And as long as we, the interested parties, are willing to stand for that kind of inspection, we are going to get just what we are getting now, nothing more and nothing less. I have had this in my system for a long while. If you had some experience with this inspection work you would know that the only way to get an efficient inspector is to get a man that knows the dairy business, knows sanitary conditions when he sees them, not some fellow that doesn't know anything about this, that has just picked up what he thinks he has from the talk he has listened to. Col. Miner, when he has one of those difficult subjects, he has to work with him, the man is under civil service and he has to work with him; he gets him in there and puts him through a course of sprouts and tries to make a dairy inspector out of that man.

Why TAG-BAKS *Bring Your Tubs Back*



is best explained by the special patented construction of the TAG-BAK itself and by those who have used them.

The projection on the back is the little device that lets the tag slip in easily and prevents the tag from coming out again. Only a sharp pointed tool; deliberately inserted in the tag can remove it from the TAG-BAK System.

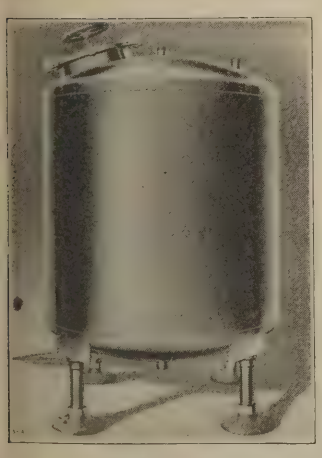
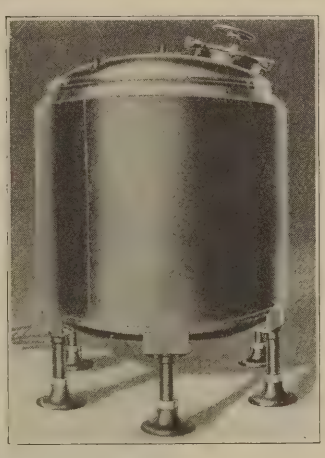
Davis Tubular Cooler

Dairymen's Philadelphia Can



WHEN a concern making this kind of equipment dominates an industry you are rightly justified in placing your orders with them. To dominate over a period of years is impossible, unless thousands of customers are satisfied. In dealing with a dominating house you are improving your chance with success. You automatically discard many chances of failure, which so often handicap modern business activities.



Every right thinking man understands that it takes merit and hard work to dominate in any line of endeavor. Many other men are trying to do the same thing. Competition acts as a stimulant. And the customers are benefited. Competition is surely the father and mother of progress. Davis-Watkins machinery and equipment has met competition satisfactorily for many years. You make no mistake in putting your money into it.

The line is complete, as to working equipment for milk plants, ice cream factories and creameries. It is all illustrated and described in the Davis-Watkins Catalog No. 6. You can easily obtain a copy of this large book on application to the nearest Davis-Watkins sales office. Send today. It is free.

ADVERTISING PUTS PUNCH INTO THE POINTS YOU PROPOSE TO PRESENT.

But no matter how hard he tries, he cannot do it, not short of years. That is what ails the inspection in this state. You don't need to go and ask for more laws or a bigger license fee. What you want is to get behind this thing with public sentiment, have the association get behind the thing, and insist that we get some inspection that is inspection. When you do that you will get somewhere. (Applause).

Chairman Courtright: Has anyone else any remarks on this question? If not, we will go on with the next subject, "Taking Long Shots," by Mr. Walter Ward, of Kankakee. (Applause.)

Mr. Ward: Mr. President and fellow members of the family. As I look upon this gathering it sort of reminds me of one big family, and that recalls to my mind a little incident that I heard of a short time ago. There was a couple of distinguished gentlemen that had been over to Roszell's town, you all know where that is; they had completed their trip and were on their way home. One of them happened to be an ex-minister that has charge of an orphan's home down the line, and he had another distinguished gentleman with him. Behind the two gentlemen in the coach sat an old Irish woman. As they journeyed along and stopped at one of the smaller towns one of the other members came in and happened to recognize them, another member of the clan. He said, "Brother Sailor, how are you getting along? How many children have you?" The old man thought a minute and he said, 180. The old lady got up behind him and said, "My God, forgive him for his sins." Brother Sailor thought for a moment and he said, "God isn't here, but I have the Grand Master." Now we haven't the Grand Master of the clan, but we have several good members, the two Johns and our good presiding officer here. I would name one John Gloom and I would name the other one Hope, and I am going to leave it to you to name the president. (Laughter.) Our friend John was one of the men that had a little gloom, John Knobbe.

Gentlemen, I have a little upon my chest. When our secretary wrote to me and wanted me to go on the program I didn't answer his letter, and it ran along for some two or three weeks. Finally I got another letter and it said, "It is about time to go to press; we have to have an answer; what subject do you want?" I had just returned from a little hunting trip. I like a gun and I like a fish rod and I like to go hunting. Well, I thought I would put him off and could get away with it. I wrote him and told him that I had figured I wouldn't be here. I thought I would put him off in that way. I told him I didn't think it was going to be possible for me to go on the program, as I didn't expect to come, but, however ,if I was there I would possibly enter some of the discussion. I said if I were to speak, possibly I would speak from the subject of Taking Long Shots. Now when I made that remark I was thinking of this hunting trip and some fool shots we had made. I didn't go into detail to tell him all the shots I had made, but I wish I had, and then maybe I wouldn't have gotten in this way .

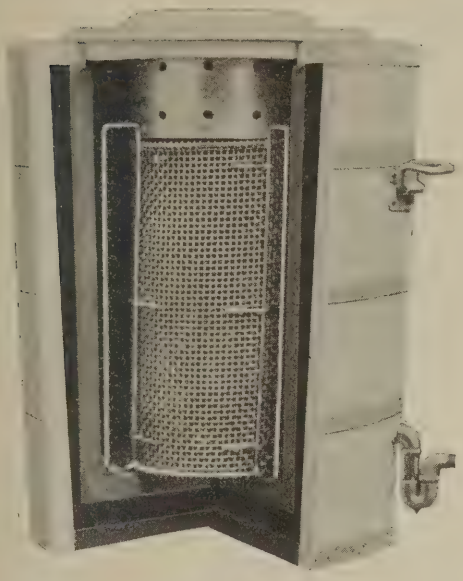
But I have prepared a little paper which I will endeavor to give to you.

TAKING LONG SHOTS.

The subject of "Taking Long Shots" is one that may be discussed from several points, of which I will endeavor to touch upon a few, namely, "Long Shots" on credits. "Long Shots" on customers out of our own territory, and a comparison of "Short Shots" of customers that are closer our own vicinity, and the results of the "Close Shots" as compared with the "Long Shots."

Possibly, the most of you gentlemen that are here well remember that the ice cream business has grown a good deal in the past twenty-five years, and if we go back to the year of 1896, we can well recall that we made some rather long shipments. It wasn't an uncommon thing to ship some two hundred miles, as you couldn't find an ice cream factory in most every town of five thousand population as you can at this particular time, and incidentally, I will say that we didn't have as many dealers, but those we did have were of a little higher standing financially than some of the numerous dealers are today, all of which leads us to believe that it is very important that we keep in close touch with our dealers, and see that they meet their weekly payments as our terms call for.

We have found that in the past few years we are able to keep a closer tab on the home dealer, as we may term him, than to keep track of the fellow that we may be able to sell that is located away some seventy-five to one hundred miles, as we have learned that he generally has a reason to want to deal with some manufacturer that is not in close touch with him, as he is not in this particular manufacturer's territory, we generally find that he is in the hole with some other manufacturer that is close to home. Then the question is asked, why should we take a "Long Shot" on such a dealer both in distance and credit.



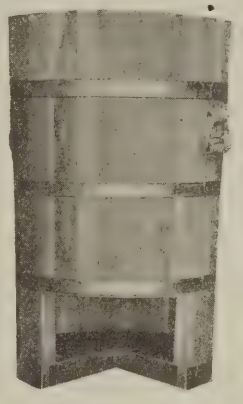
Does it stand to reason that this particular dealer would go a hundred miles or more for his goods when express rates are most double, and there is a chance that he would be out of goods a part of the time, and the cream would be on the road possibly twice as long, and arrive with half of the ice and salt gone when he received it, and very seldom return empty tubs and cans? On the other hand, is it quite fair to your fellow manufacturer to go into his own territory if you are not well located, and disturb or upset his trade and create more or less grief, all of which generally ends up in some consideration of some kind or other from one of the manufacturers, either an allowance of part of the express charges or a cash discount, which really means a cut in the price any way you figure it? And when the season is over, we look over this particular dealer's account, and generally find out we are carrying quite a nice little balance, possible because he wasn't located where we could call upon him quite as handily as a dealer that was closer at home, or where we had other dealers to call on closer at hand, and it was quite natural to drop in upon them. We personally have learned that a territory closer at home and well cultivated has proven to be more profitable than going out on a wild goose chase and "Taking Long Shots" both on long distance hauls and poor credit accounts. We have found that the dealer that is located within a radius of some forty miles or closer, with a little special attention and care will generally be more profitable if you will give him a few assortments of flavors and specials, and not depend on him handling strawberry and vanilla only, as the public is generally looking for something new.

I say to my fellow manufacturers, get away from the idea that you cannot afford to make specials, as there isn't the demand for the fancy fruit or flavors to warrant your carrying them, till you try them out and build up a demand. Then you will find out people do want something better and different for which you can get the price.

Measure up your distance. Figure out your "Sure Shot." Deduct your "Short Shots" from your "Long Shots." See which brings in the gain.

Chairman Courtright: The next on the program is the subject of "**Increasing Ice Cream Sales in Winter,**"

The Thermos Ice Cream Cabinets



Patent Pending.

Built like a Thermos Bottle — Works on the Same Principle

The simple fact that other manufacturers are imitating our Thermo Idea of insulation proves it to be not an experiment but an assured success.

Will keep Ice Cream 36 to 50 hours solid without repacking with ice. Has smaller ice chamber, therefore more economical. Its shape and little room it takes makes it more adaptable for use in any place.

Made in 3 and 5 gallon size in singles and in 5 gallon sizes in double, triple and quadruple compartments.

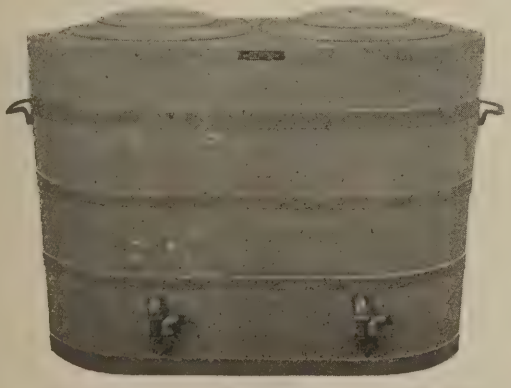
Cut showing one of our Regulars with section cut out. Note heavy construction.

The heavy Tinned wire can container in the fives are for convenience to user as well as separating ice and can chamber, thus making cabinet sanitary. Empty cans may be removed without disturbing packed ice chamber.

LARGE DESCRIPTIVE CIRCULAR AND PRICES ON REQUEST.

Our White Cedar Ice Cream Packing Tubs are

LUMBER JACKS



for Toughness, Strength and Durability

They will not waterlog and are the nearest possible resistant to acid and salt brine. They are built of **Michigan White Cedar.**

The heaviest built and lightest weight tub combined. Compare one of our 20 quart standard size weighing 27 lbs. with any other make for weight. See what that means in hauling and freight.

Note heavy construction and dovetailed bottom on sectional cut, also 1¾ inch solid bottom, built flush with bottoms of staves.

We sell **direct** to the **Ice Cream Manufacturer.** Our product is built in our own factory from the **Raw to the finished, complete,** by **skilled** mechanics.

Cut shows one of our two compartment Cabinets.
Patent Pending.

Prompt service and satisfaction guaranteed.
Send for our circular and prices.

Archie J. Verville Co.

Manufacturers and Dealers in
Forest Products

HANCOCK, - MICH.

by Mr. Talcott, the Advertising Manager of the Hydrox Company.

Mr. Talcott: Mr. President, ladies and members of the Association. I have been asked to make a few remarks on the subject of increasing ice cream sales in the winter time. I think there can be no doubt that ice cream sales are increasing in the winter time, due to the fact that people have learned gradually there is no chill in a dish of ice cream, especially when that dish of cream is eaten in a comfortably warm dining room or parlor, and, in fact, that under some circumstances it may be quite as refreshing as when eaten on a hot summer's day.

W. W. TALCOTT

I think the manufacturers of ice cream have blazed the trail in the question of developing winter sales. They have done this by serving each winter a few more shops than they did the year before that didn't pay. While this has caused a loss, I doubt if it has been a greater one than would have been the case by discontinuing the service and allowing the plant and the equipment to lie idle during those months.

It must be more borne in mind that the public is imitative, that if the Smith's serve ice cream to the Jones's, the Jones's will do the same to the Johnsons, and the Johnsons will do the same thing to the Smith's, and thus there are a long series of positive suggestions of the desirability of ice cream as a winter food set up which will result in a considerable amount of business over a reasonable period of time.

I am inclined to think that in the main the ice cream manufacturers haven't made as much effort in this direction as they might have done. They have been inclined to lie back at the end of the season and take things rather easy, whereas if they had made a more conspicuous effort I think they might have developed a considerable amount of business in that direction.

That reminds me of a little story that Mr. Bridges tells about an auto salesman out west several years ago who startled the agency back east by sending in orders for immediate delivery of cars in mid-winter. After the second or the third order had been received the manager back east telegraphed back west to know what the fellow meant. The fellow telegraphed back and said he didn't know that he wasn't supposed to sell cars in the winter time, so he kept right on selling them. The salesman back east, realizing that cars were hard to sell in the winter, hadn't been making any real progress in that direction.

In the preparation of the remarks that I am giving you I communicated with both The Ice Cream Trade Journal and The Ice Cream Review, and succeeded in getting some rather valuable statistics from both of them. I learned through the Trade Journal that whereas many years ago the relation between the high and the low months of the year was twelve or thirteen to one, in 1920 it was five and one-half to one. I also learned that the average consumption of the month of January, 1920, compared to the consumption for the whole year, was 3.18 per cent. That was taken from a large number of manufacturers and that was the average.

From The Ice Cream Review I succeeded in getting a large number of letters they had gotten from various sources, one of which indicated that a certain manufacturer somewhere in the east had succeeded in developing five per cent of his total 1920 business in the month of January. That was so far above the average and other reports that had come to my attention that I wrote to The Review to find out if possible what the particular dealer had done. They said they would find out for me if they could. In a few days I got a response from them and I want to read that response. It is anonymous, I presume because of the fact they wanted to keep the matter somewhat confidential.

This company writes: "The increased sales in January and February, 1920, were due principally to the special winter advertising campaign. We have selected one of our plants this year and will spend the advertising appropriation during the lean winter months on meeting summer advertising, and we hope to have something of interest to report at this time next year."

That letter I think gives something of the trend of the manufacturers throughout the country in that direction.

I sent out two hundred inquiries or questionnaire letters for the purpose of determining, if possible, the relation of winter advertising to winter sales. I received quite a number of responses, and after tabulating them I found that the concerns that were advertising rather leisurely and principally in the summer time, re-

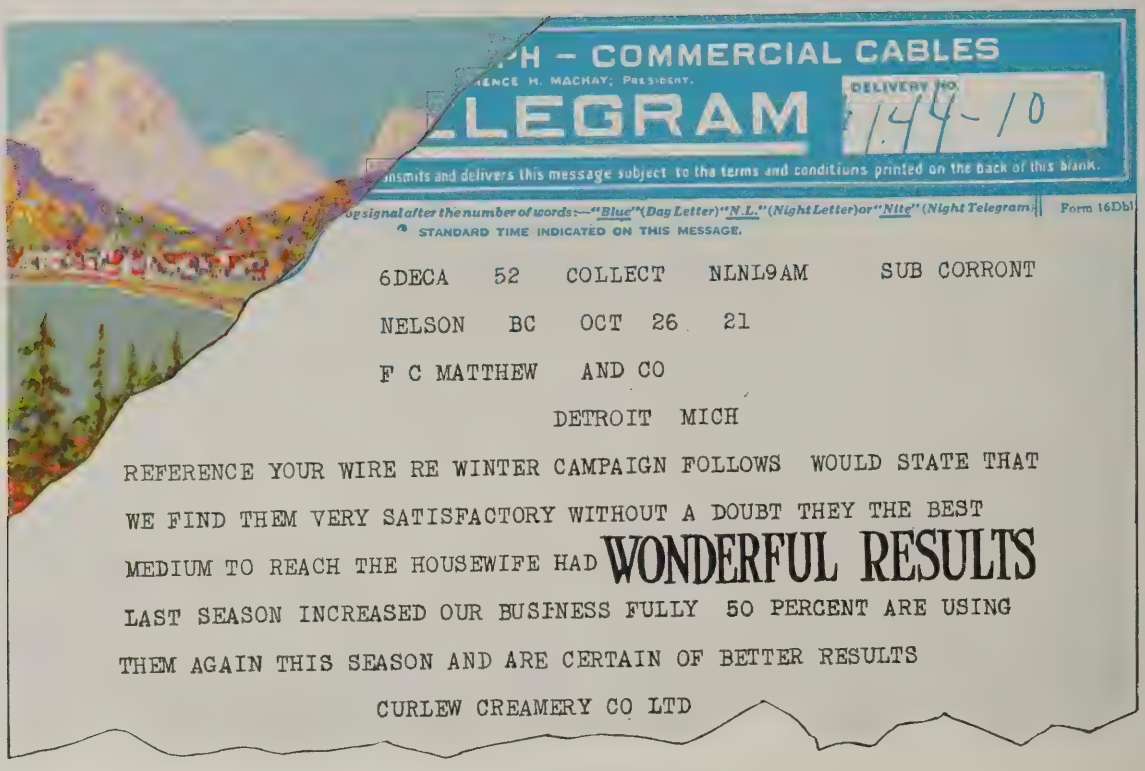
"WE MAKE NEW ONES OUT OF OLD ONES"

HAVE you learned how to "speak the language" of the better class women folk of your city?

To raise ice-cream from a child's "treat" to the plane of a delicious frozen dessert servable as a regular thing at the family meals—*that's* your problem!



Do that and it's "all over but the shouting!"

"Mathews" illustrations of ice-cream dishes that have the "class" and "character" of the above; well —*you* see where they'd come in, in *your* ice-cream advertising.

THE ASSOCIATION OF ICE CREAM SUPPLY MEN
MEMBER

FREDERICK C. MATHEWS COMPANY
"SERVANTS TO THE DAIRY INDUSTRY"
P. O. BOX 834 DETROIT, MICH.

This insert was produced complete by the Frederick C. Mathews Company, Detroit, Mich.

"Wonderful Results"—

Selling Ice Cream in Nelson, B. C., where below zero weather is not unusual

THE campaign referred to consisted of clever folders mailed twice a month to the housewives of Nelson, British Columbia, a city of about 25,000 people situated among the Canadian Rockies.—(But the folders were *unusual!*) The thermometer occasionally registers many degrees below zero and the snowfall is always heavy at this point and yet you have this manufacturer's own statement that "wonderful results" were obtained in getting the women of Nelson to use *more* ice cream during the winter months (*50 per cent more!*)

As a live manufacturer this is something you'll want to look into. The Mathews man will call if you give the word.

"Barren Spots"

For those "barren spots" in your natural selling territory where you should be selling but are not—we heartily prescribe such a campaign as this.

It can't help but "start something."

THE ASSOCIATION OF ICE CREAM SUPPLY MEN
MEMBER

FREDERICK C. MATHEWS COMPANY
"SERVANTS TO THE DAIRY INDUSTRY"
P. O. BOX 834 DETROIT, MICH.

ported a total of 2.27 per cent of their 1920 business done in the month of January, but the manufacturers on the other hand who reported themselves as aggressive advertisers, and as inclined to spend money in the winter time, had done 2.96 per cent of their total year's business in the month of January.

Now that difference perhaps doesn't seem very great, but it must be borne in mind that the concerns advertising in the winter time are helping to develop business also for the fellows who were not advertising. It seems to me that if it is considered desirable to equalize the various months of the year, and if it is perfectly clear that advertising helps in this direction, that the associations of ice cream manufacturers of the country might well follow the lead of the fruit growers of the country, the orange growers, the apple growers, and the raisin growers, and put on a national campaign bringing out the best features of ice cream as a winter food. It seems to me that if a single manufacturer of yeast has been able to get the whole country talking about his product and eating yeast, eating it in sandwiches and drinking it in tea and swallowing it whole, that the collective ice cream interests of the country ought to be able to get men, women and children to stand on the corner and eat ice cream in a snow storm, due to the increased health this food ought to be able to give to them.

Now I don't presume that much could be done of that sort if it were desirable this winter, but thinking perhaps some of those present might be inclined to do something in the way of immediate advertising, I have jotted down a few phrases that might be used as headlines: "Harden yourself to endure cold—eat plenty of ice cream." "Ice cream is a great hardener." "Ice cream for lunch on school days will enable your children to enjoy themselves these rugged winter days." "Keep up your resistance to cold this winter by eating plenty of ice cream." "Fight cold with cold—eat ice cream." "The blasts of winter will have little effect on children that eat ice cream."

Now if it seems desirable to equalize the various months of the year, it seems to me that the fairest and best way of putting over the proposition would be to go into the national field and endeavor to make people realize there is healthfulness and resistance to be developed through the eating of ice cream throughout the winter. I would like to have that matter discussed and agitated by the association.

Thank you, Mr. President. (Applause.)

Chairman Courtright: Are there any suggestions on this advertising question? Any remarks?

If not we will go on to the next subject, "**Getting Better Acquainted,**" by our old friend Mr. Holmes, of Manteno, probably the best known man in the association. (Applause.)

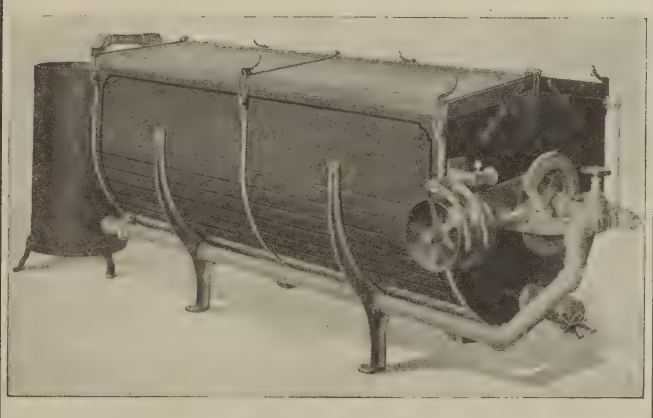
Mr. Holmes: Mr. Chairman and guests of honor and gentlemen of the convention. It seems like it is pretty late to talk about getting acquainted after you have been here two days. You would think perhaps I was on the social committee, but that seems to be the way the secretary arranged it to get me the last.

Now, then, I want to say this, that I have had considerable experience in getting acquainted, and I assure you it is one of the best investments you, as manufacturers of ice cream can make, is to meet and greet and get acquainted with your fellow co-worker. Don't think there is a little space for you in your own locality, but be willing to reach out.

Now if you will just bear with me I will take a little trip. Suppose we are going to Los Angeles, Calif. I am sure our old friend Mr. Christopher, the genial Frenchman that it was my privilege to introduce here

Uncle Sam Never Lies!

In a recent test made by the Bureau of Standards, Washington, D. C., lino-felt was shown to have a smaller conductivity than cork-board. In other words, lino-felt was shown to be the better insulation.



The ordinary coil vat is insulated with half inch cork-board while the Manning Batch Mixer is insulated with one inch lino-felt. The Manning Batch Mixer has better insulation and twice as much of it.

That's one of the reasons why the Manning is the most efficient batch mixer on the market.

MANNING EQUIPMENT

MANNING MANUFACTURING COMPANY

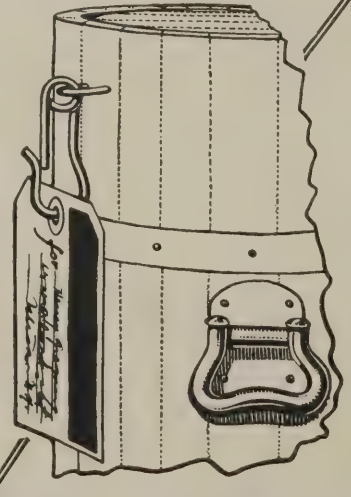
The First Cost, Low As It Is— Is Practically The Last!

a few years ago the first time he was at an association meeting, would be glad to meet you, as I met him a few days ago and he said, "Come and see us." And if you are going to Frisco you will meet Mr. Wilson, and then you will go on up to Tacoma and meet Mr. Walker, and from there on down to Spokane where we will drop in on Mr. Martin—and I recall that five years ago I met him down at Atlantic City at lunch one day and he said, "We have no association in the northwest. I wonder if you could give me something that would be helpful in the organization of an association in that district." I told him "I will be glad to send you a Year-Book, and such other data as I may secure." I forwarded to him the Year Book and other data, as I said I would, and after the gathering they had he wrote me a splendid letter and he said, "That was a great help to me." Now it was no effort on my part, particularly, just a good will and a spirit of friendship for my fellow man.

Coming on down to Minneapolis, to those of you who attended the national convention a few weeks ago, I want to say to you and to those of you that didn't attend, we surely had a great time. The manufacturers of that city, Mr. Ives, Mrs. Babcock, Mr. Slater and Mr. Steele outdid themselves for our comfort and pleasure; that splendid ride we had through that city, in forty-five autos, all labeled The National Ice Cream Manufacturers, and as we went over that city, around among the lakes, and the falls, and the rivers, and over to St. Paul, where we saw the State House, and also the University of Minnesota, and then back to Minneapolis, where we saw the great flour mills, and it surely was a splendid trip, and I know any of you that were there certainly enjoyed that hospitality of friendship which those people extended.



TAG HOOKS
Save Dollars

Why use expensive, untidy, time-losing strings or wires while tagging your tubs or pails of ice cream?

SNAP 'EM ON

and use our rust-proof tag hooks.

SAVE TIME—Figure the cost of strings or wires. Then think of the value of a man's time while tying the tags on your tubs.

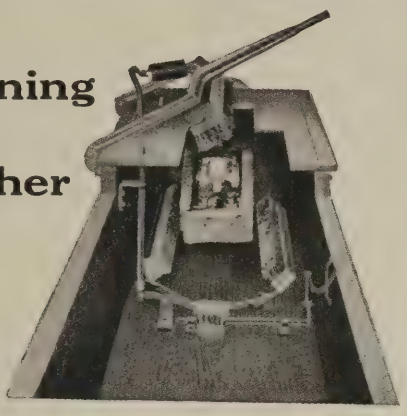
Our new type of hooks are made of SPECIAL SPRING BRASS. They sell at $1 95 per hundred, including staples. Besides a 10 per cent discount in lots of a thousand or more. Samples on request.

DALY BROS.
SCHENECTADY N. Y.

Coming on down on my return home I stopped at the capitol city of Wisconsin and I was entertained there by the American Ice Cream Co. and the DeCanada Dairy Co. Then I recall being over in Milwaukee last spring in February when we had the Wisconsin State Convention, and I went over in the morning before the convention and had a little talk with Mr. Luick. He showed me an outline of the diagram like you have seen in the rise and fall of the waters, and also of the Board of Trade the rise and fall of the markets, and he had a different year outline and he showed all the different rises and falls during the year, and he showed me one there that was startling when sugar went off the top (laughter), and it brought to mind some of the arguments that he discussed in the convention a year ago, and Mr. Luick knew whereof he spoke.

A few weeks ago I was over on the west side and stopped in to see Mr. Cunningham's plant. Neither Mr. Cunningham nor his son were present, but the genial lady in charge at the office called one of the gentleman who showed me around, and his voice sounded very much like he might be a kinsman of John, but I think he was from the Emerald Isle. As we went over the factory I can assume you it was a great pleasure to see and assure you of the great care and industry that was put forth. I am not putting any roses on Mr. Cunningham's coat, because he is more like the admirer of Priscilla of old, John speaks for himself. (Laughter.)

Then if we should go on a little further and over into Buffalo a few years ago I visited that factory, and as I entered the Wheat's plant I stepped back, I was almost startled, I read on the laboratory door, "Dr. C. J. Gorden." Do you remember how John Knobbe almost ate the Doctor up in one of his addresses here a short time after?

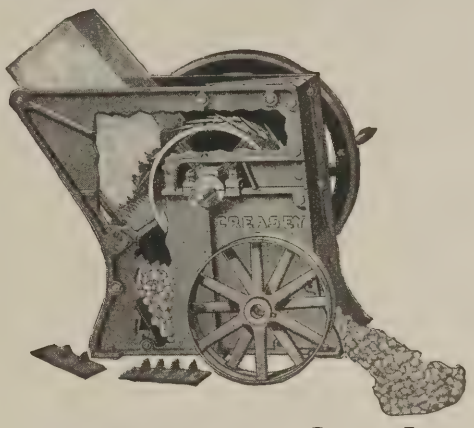


Then, going down a short ways further to Rochester I am sure Mr. Nivling would be glad to greet you; then on to Boston and Eli Perkins and Taft Brothers of Springfield, and when I went on down a little farther to New Haven to greet our president, Mr. Morse, and also Mr. Seaman, and a few years ago I visited the Horton plant, and I want to say that I never was more nicely entertained and taken over that large place that it is, and shown all the details, even into the book department that they carry out. And then we were going down a little further and we would come to our friend Mr. Hendler, that genial Dutchman which you all are glad to know. And then our friend Asa Gardner down there, you know he is out of the ice cream business and he said he is out on bond and under indictment at the present time. Perhaps that is for getting out of it.

Then if we should come back to Philadelphia we have our genial friend, old Mr. Crane, whom we all like very much, and also Mr. Shipley, and over to Pittsburgh, Mr. Reich, and if you should go away to the south you would be entertained by our friend George Moedecker, whom we all like and remember very well.

Now that is the outside, and I like my neighbors, I like the gentlemen from up in Milwaukee and also Marshfield and Fond du Lac and a number of those places up there. Also the neighbors over on the east side, the men of Indiana, Logansport and Indianapolis and South Bend, Kokomo, the old home of Charles Stewart, where so many things happen. But best of all I like the men of Illinois, because I know them better. We have had some splendid work done in Illinois.

Now acquaintanceship develops two or three, possibly four, things. One is a desire. If you have the acquaintanceship it creates a desire in your mind that you want to develop. When you reach out and develop that oftentimes creates competition, and when you get



Manning Can Washer

More thorough, more dependable and more economical than hand washing—gives you greater friction that cuts loose every particle of film and grease.

Turns a mean, sloppy job into a pleasant task, keeps workmen contented, and makes it easier to hire more good men.

The brushes reach every curve and corner of the cans, inside and out. Brushes can be removed separately as they become worn—no necessity for buying a complete set of brushes when one wears out.

Creasey Ice Crusher

This is the favorite "Old Ironsides" which has been grinding through tons of ice year after year for a host of satisfied users.

We carry Creasey Crushers in carload lots, in Chicago—a saving to you of time and freight.

This is a sturdy machine, built over-size throughout to stand up under the hardest service. Every ice creamplant needs it.

BARBER

AS the ice cream season draws near you will find that you must have certain equipment or supplies—in a hurry. Remember that we carry in stock everything from parchment to heavy duty freezers, ready for immediate shipment—in line with our policy to serve the trade well at all times, and *when they need it most.* You can save freight on most items by buying in Chicago—from Barber.

Rogers Brick Maker

A machine that is really marvelous in its speed, accuracy and labor saving possibilities. Turns out three color bricks at the rate of 4 gallons per minute, REGARDLESS OF WHETHER IT IS OPERATING ON QUARTS, PINTS OR INDIVIDUALS.

Fills directly into tasteless, odorless, well-paraffined bleached sulphite cartons.

Let us give you more information about this splendid machine.

Pure Vegetable Parchment

We can ship immediately any standard size of vegetable parchment paper circles for ice cream cans, or parchment squares for wrapping ice cream bricks or individual pieces. Printed in one color or two colors. A special design or cut, when desired, is furnished at cost. Write for price list.

competition then you need co-operation, and if you will permit me just for a moment or two I will dwell on that —co-operation—that is a great thing; it has been responsible for a lot of good; it has been spoken of by Mr. Nivling and some of the other speakers.

But here is one thought, "together we stick, divided we are stuck." (Laughter and applause.) The story is told, not a story, either, but the truth, of one of our employes at one of the asylums who had care of the unfortunates, and they asked him the question, he says, "Are you not disturbed at having charge of all these people with their minds as they are?" "Oh, no," he said, "they will never get together, they are crazy." (Applause.)

This matter of co-operation is a great one. We only have to look back and to see how Bavaria and Prussia didn't get together and co-operate and help Germany to perhaps further her damnable schemes, while on the other side England and France and America and Italy, by their co-operation, got together and stayed the hand of destruction, and that is what we need to do, to co-operate to stay the hand, perhaps, of some of the unfortunate trade practices that are being practiced throughout this land of ours.

On the morning of November 12, when the great conference was in session down at Washington, which we are looking and hoping for so much from, our secretary, Mr. Hughes, voiced the sentiment of the Great Emancipator, Abraham Lincoln, for honesty and honor when he spoke in regard to the wonderful heritage that he handed down to us that we might follow after. Then Premier Briand on that morning of November 21, when he spoke so wonderfully in defense of his home land, France, how she had suffered because of the lack of co-operation of her neighbors.

"Doc" says:
If bacteria were as big as cockroaches everyone handling milk or its products would quickly appreciate the need for Germ-X—Dairyland's Greatest Disinfectant
But because bacteria are invisible many plant managers think their plant is free from this quality-destroying pest.
The result is the keeping qualities and the excellence of the flavor of their product are impaired.
A small amount of Germ-X kills a large amount of bacteria.

Now then, gentlemen, I won't dwell further upon this matter of co-operation. It has already been enlarged upon. But I believe I can say with a good deal of desire that we must not draw a radius around about our factory that will reach down state for perhaps one hundred miles and say that we must have all there is in that territory, regardless of who else has been there. This desire for gallonage, as Mr. Nivling has also spoken of, is sometimes too strong, and we are making a mistake, although we have had some splendid co-operation in the state of Illinois.

I remember in the spring of 1920 when that sugar went over the top and the manufacturers of this state, we didn't know what we were going to do, and we called a meeting down state and took that matter up and we found that in order to break even we had to have a little advance in the price, and that price was advanced perhaps ten cents, and automatically, it seemed like, that price that was started down in that vicinity went to the north, it went to the west, it went to the south and way to Texas.

Now, then, last spring we had a decline in that product and felt like we must reach back to about where we were before. So it seemed like that perhaps some of us didn't get out early enough, and as a result there seemed to be destruction on the north, on the south, and on the east, and then it went across the state, and the result of it was some very low prices, and if you could confer—and I know whereof I speak—with some of these men, you would discover that the right hand side of the ledger of a great many of those factories that cut those prices are not reading just right.

We have had a lot of trouble here in Chicago, and they have been doing some things that are going to ruin some of the buyers if we are not careful. There are a lot of things that have gone into the "give away game," and with such results that it is harming the industry, and we must make the best that we possibly can of it, render service that cannot be infringed upon, then get what your product is worth, but don't give away a lot of these trimmings that will be against the movement and the betterment of the industry. I say hold fast to that which is good, give a good square deal, and then our industry will continue to grow and be benefited.

I thank you. (Applause.)

Chairman Courtright: That seems to end our program for this morning. The most important session that we expect to hold at this convention will be this afternoon. It is for manufacturers only—our neighboring states are invited to be with us, of course—and it is more of a round table meeting, and it will be most important for every manufacturer to be here and be here promptly at two o'clock. We want to get through this afternoon, but I want to say that this will be the most important session we will have at this convention, and if there is nothing further this morning, we will stand adjourned now.

Adjourned at 12:30 P. M.

There was nobody who could play the violin like Binks, and he was delighted when asked to play at the local concert.

"The instrument I shall use at your concert," he explained to the host, "is over 200 years old."

"O, that's all right, old chap. Don't worry about that," replied the host. "I shan't tell, and no one will ever know the difference."—Ideas.

"The Package Sells the Goods"

The Imprint of Quality

There's a positive selling appeal in an attractive Carton. Not only does an attractive package influence individual sales where there is competition and an opportunity for comparison, but it also *sells* the consumer on the business concern that respects its product enough to market it in a modern and attractive package.
It's logical for buyers to assume that the product inside an attractive high grade carton is of the same high grade and quality.

In numerous instances MENASHA specially designed Ice Cream Cartons have built up brick cream sales far beyond expectations. No doubt there is room for an increase in sales in your field. It's a certainty that a specially designed MENASHA carton will do much in helping you to accomplish your sales purpose.

We are also equipped to reproduce your three color carton design on pails.—Wire or Tape Handles or Tapeless.

ACCURATE AND INSTANTANEOUS TESTING OF OVERRUN IS THE RESULT OF A GOOD TESTER.

RESULT OF SECOND KANSAS SCORING CONTEST.

The second annual Kansas ice cream scoring contest was held at the Kansas State Agricultural College, Manhattan, Kansas, on February 23 and 24. A district meeting of the Kansas Association of Ice Cream Manufacturers was also held at that time.

That considerable interest was shown in this meeting is manifested by the fact that forty-one packers of ice cream were entered and about fifty manufacturers and makers attended the meetings. That the manufacturers are endeavoring to make a high quality product was evidenced in the great improvement shown in the samples this year as compared with the 1921 meeting. With the exception of two or three entries the ice cream this year was of very high quality and indicated careful attention to standardization and sanitation.

A few exhibits had old cream flavors, one indicated dirty utensils, one sour cream, and several indicated the use of old skim milk powder. It has been evident for some time that certain manufacturers of skim milk powder have been endeavoring to dispose of old stocks. It is to be hoped that they will soon see the error of their ways and only send fresh goods out for the use of ice cream manufacturers.

Body and texture were excellent in a majority of the samples.

Another fact that was noted was the condition in which the ice cream arrived. Some samples reached Manhattan in excellent condition even after being on the road a long time, while others with a shorter distance to travel arrived in very poor condition. The difference was due to the proportion of ice and salt used in packing. If too much salt is used the ice melts very rapidly, keeping the ice cream very hard for a time, but by the time the destination is reached all the ice cream has become soft. It is more economical to use less salt in shipping and ice cream arrives in better condition.

The object of the scoring contest is not to determine who makes the highest scoring ice cream, but to point out the defects in the various samples and furnish instructions for improvement.

N. E. OLSON,
In Charge, Dairy Manufacturing.

ICE CREAM PLANT FOR WILLISTON.

F. E. Erickson is the proprietor of a new ice cream plant in Williston, North Dakota. A site has been purchased and the building has been put in shape and by the time this paper goes to press, it is expected that the plant will be in operation.

A large creamery department has also been installed in addition to the ice cream manufacturing department, the latter of which will take care of 600 to 800 gallons per day. A ten-ton Creamery Package refrigerating machine has been installed.

An extra room 25x50 feet is to be used in handling eggs and poultry.

The creamery owned by the Williston Farmers' Creamery and Produce Company burned last Fall, and Mr. Erickson has purchased all the cans and station equipment owned by the farmers, and all machinery that had passed through the fire that could be used, and intends to add more to his equipment as fast as the business warrants.

Mr. Erickson intends to lay his foundation right, from the start—he has ordered The Ice Cream Review. We wish him unlimited success in his new venture.

ADVERTISERS AIM TO CONTRIBUTE TO THE SUCCESS OF OTHERS.

PROF. BAER'S INQUIRY DEPARTMENT

Dear Sir:—We are contemplating on installing an incubator and sterilizer for making our own bacteria tests. We wish that you would be good enough to advise us the equipment that will be necessary for this class of work, also let us know where the same can be purchased. Wish kindest regards.

Yours truly, P. & B.
c/o P. I. C. Co.

Reply: I have your letter of January 23rd relative to a request for the equipment necessary to start your own bacteriological work. I do not know exactly what you have in mind but if you should want a complete bacteriological laboratory you would undoubtedly have to employ a competent man, at least for a time, to get this work started. For your information I might suggest that you could perhaps employ one of our graduate or senior students during the coming summer and he could probably instruct a lady or someone else in your plant who could carry out the work after learning how to do it.

It will require a pretty long list of apparatus including an incubator, auto-clave for sterilizing the media, cooking utensils for making up the media, sterilizing cabinet for glassware and, of course, all manner and sorts of bacteriological glassware. All this material can be secured from A. Daigger & Company of Chicago, Illinois.

Boston Tongs No. 540, Drop Forged, full swell handles, points ¾" wide, 13 to 26 inch span.

ICE TOOLS
built for business

G-W Ice Tongs are of special heat-treated steel to start with; 85 years of experience in design, then expert workmanship on each of the twenty-six manufacturing operations, produces tongs unequalled in stiffness, gripping power, ease of handling, long life. And we make twenty-seven different models in various spans to meet every requirement.

G-W PRODUCTS

Individual ice tools for all uses; complete harvesting and storing equipment, natural ice, all machinery for handling artificial ice. Accessories for men, store, wagon, and ice house. Engineering estimates on any size plant. Catalogs on request. Ice tools repaired.

BUILT STRONGER LASTS LONGER

108 YEARS PROGRESS

Works: 18 Second Hill, Hudson, N. Y.

Branches: New York, Chicago, Boston, Buffalo

Gifford-Wood Co.

ICE HANDLING EQUIPMENT

2028-R

If you should be interested in securing one of our students or should you want a complete list of everything in order I suggest that you write to this company and get their catalog of supplies to equip a bacteriological room and I shall be glad to mark the things which you will need, in the catalog, if you will send it to me.

This equipment added to your very modern ice cream plant, although it will probably cost you $1,000 or more to put in a complete equipment, will be a valuable addition to your plant and would, of course, be the only factory in the state equipped in this manner. I can assure you that I will do all I can to assist you in getting this laboratory started.

* * *

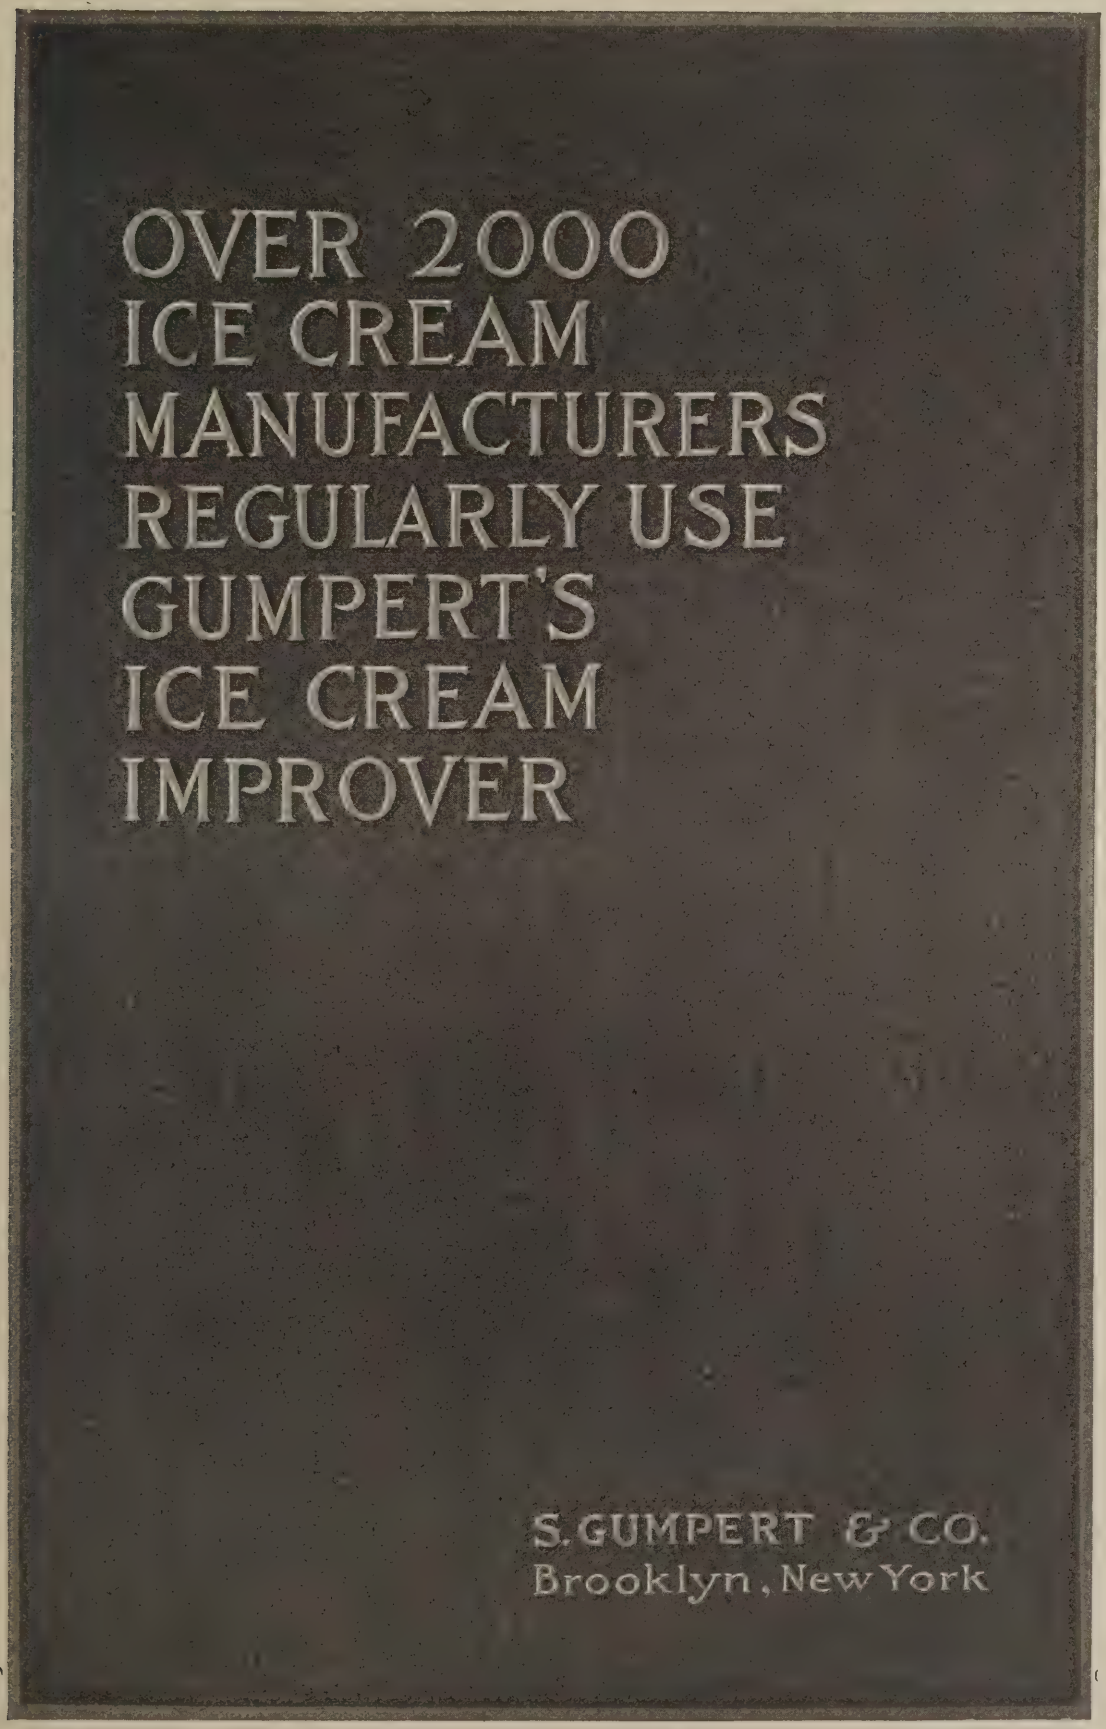
Dear Sir:—I have a fair ice cream equipment but have never had the quality of ice cream I wish. I make my mix from 3.5 per cent milk, sweet butter and milk powder. I pasteurize this in a 50 gallon starter can for 20 minutes at 140 degree F., run through a De Laval emulsor over a cooler and age for 24 to 48 hours at 45 degrees F. I have tried various formulas you have endorsed so I am sure my proportions are right.

Now I want you to give me the formula you would use if you were going into the business yourself where competition was keen and you wanted to beat them all on quality and price and also supposing you could not get sweet cream.

I want you to tell me what to do from A to Z. Does the use of eggs help in ice cream and is it practicable? How do you use them?

Now I want you to figure on 10 gallon (denomination) mix which is your favorite.

I have used the best milk powder I could secure and it always tastes in the product. Is there any substance that can take the place of condensed or powdered milk?



Respectfully, O. B. S.

Reply: I have carefully read over your letter and it occurs to me that you are having trouble with your ice cream mix from some other reason than the ingredients you are using in your mix. I suggest that you explain to me in detail just how you make up your mix, giving weights of all ingredients used, in a definite quantity of mix.

The principle factor in getting a good quality of ice cream from a sweet butter and powdered milk mix is to use as fine a grade of butter as it is possible to get along with a perfectly soluble, flaky milk powder. I have used Merrell-Soule milk powder for a long time and have not found anything wrong with it as long as it is in a nice, fresh, flaky and soluble condition. If, however, the powder is old, its solubility is not good and it will also usually impart a flavor to the cream. A bad grade of butter, especially one which is somewhat rancid, will leave a flavor in the ice cream.

We recently scored a can of ice cream sent from Kansas City which we used in a scoring contest. This ice cream was made up from butter, powdered milk and water. More than fifty ice cream makers participated in scoring twenty cans of ice cream and practically all of them agreed that this particular ice cream scored perfect in flavor as well as in body and texture. Not one of them were able to detect a powder flavor or butter flavor in the finished product so you may see that it is not necessary to have a powder flavor in your ice cream providing you are using good powder.

Eggs are not used in commercial ice cream to any great extent; if they are used at all they are used in a raw condition, whipping up the yolk and white separately before adding to the cream. You stated in your letter that possibly the large ice cream factories had

WORK, FAITH AND CO-OPERATION ENHANCE PROSPERITY—COUPLED WITH GOOD EQUIPMENT.

some secret of their own in making ice cream. No ice cream factory has any such secret to my knowledge.

I suggest that instead of writing me a general letter asking for definite instructions you tell me exactly, giving every detail, as to how you handle your ice cream mix, etc., and if you are doing something which is not correct I shall be glad to assist you farther.

* * *

Dear Sir:—Below you will find our formula for ice cream which we would like you to criticize, and offer suggestions for improvement, as we want to make a good commercial cream.

We expect you to say we are using too much sugar, but they want it sweet here, and sugar is cheap, and we are using more than we did in war times.

	S. N. F.	Fat
14 lbs. sugar	13.35	.....
22 lbs. 40% cream	1.07	8.80
42 lbs. 4% milk	3.58	1.68
21 lbs. skim condensed	5.67	.....
.5 lb. gelatine	.5	.....
.5 lb. flavor	.....	.....
Total, 100 lbs.	24.17	10.48

We sometimes use skim milk powder—2 or 3 pounds. and less condensed, but retain the same amount of solids.

What amount of finished creams should we get from this mix, and would it improve our cream to use some ice cream powder? J. R. N.

Reply: I have your letter of recent date with a discussion of your ice cream mix. You have probably noticed that for some time I have been recommending 14 per cent sugar as most ice cream factories would want to use more sugar now than they would when sugar was rather expensive.

A Magic Transformation

A better description in so few words is hardly possible for our process of

Retinning Ice Cream and Milk Cans

But differing from magic, the results of the sanitary triple coating process are lasting.

Send us a sample can for retinning and let us show you what we can do and how profitably for you.

SANITARY TINNING & MFG. CO.

3753-63 E. 93rd Street CLEVELAND, O.

I find on analyzing your mix that you have all the ingredients proportioned correctly and you also have the correct amount of fat, serum solids, and total solids. Your 100 lbs. of ice cream mix should weigh about 4.5 lbs. to a gallon and should yield a little better than 22 gallons.

* * *

Dear Sir:—We have been buying our mix already prepared and standardized but wish to make a mix of our own to use up some of our surplus milk and sweet cream. We want to put out a product containing 14 per cent B. F. or better. Will you kindly give us an analysis of the following mix: 125 lbs. sugar; 30 gals. 46 per cent cream; 30 gals. concentrated skim—concentrated 3 to 1; 30 gals. 3.5 per cent milk; 5½ lbs. gelatine dissolved in 2½ gals. water; 2 qts. vanilla extract; 1 lb. Gumberts' improver.

We have been using this mix temporarily but find that we do not get quite as much overrun out of it as we do out of the homogenized mix we have been buying. Is this on account of our own mix not being homogenized or being out of balance? We would appreciate any improvement you can suggest on this mix.

J. J. C.

Reply:. You will find below in Table No. 1 a complete analysis of your mix and you will notice that it shows 12.7 per cent butterfat and a total solids of nearly 38 per cent.

Table No. 1.

Ingredients	Fat	Serum Sol.	Total Sol.
125.0 lbs. sugar	....	.....	118.75
234.0 lbs. 46% cream	107.60	11.30	118.90
270.0 lbs. condensed skimmilk	....	72.90	72.90
258.0 lbs. 3.5% milk	9.03	22.17	31.20
5.5 lbs. gelatine	....	.....	5.22
20.8 lbs. water	....	.....	.....
4.2 lbs. vanilla extract	....	.....	.63
1.0 lb. improver	....	.....	.95
918.5 lbs.	116.63	106.37	348.55
Per cent	12.7	11.5	37.9
Per cent sugar	13.6	.....	.....

I think that your trouble in securing a satisfactory overrun is undoubtedly caused by your mix containing too high a per cent of total solids. You will also notice that you do not have the 14 per cent butterfat which you thought you had. If you are going to use 14 per cent butterfat you need not use over 8 per cent serum solids which means that you could use considerable less condensed skimmilk than are you now using.

* * *

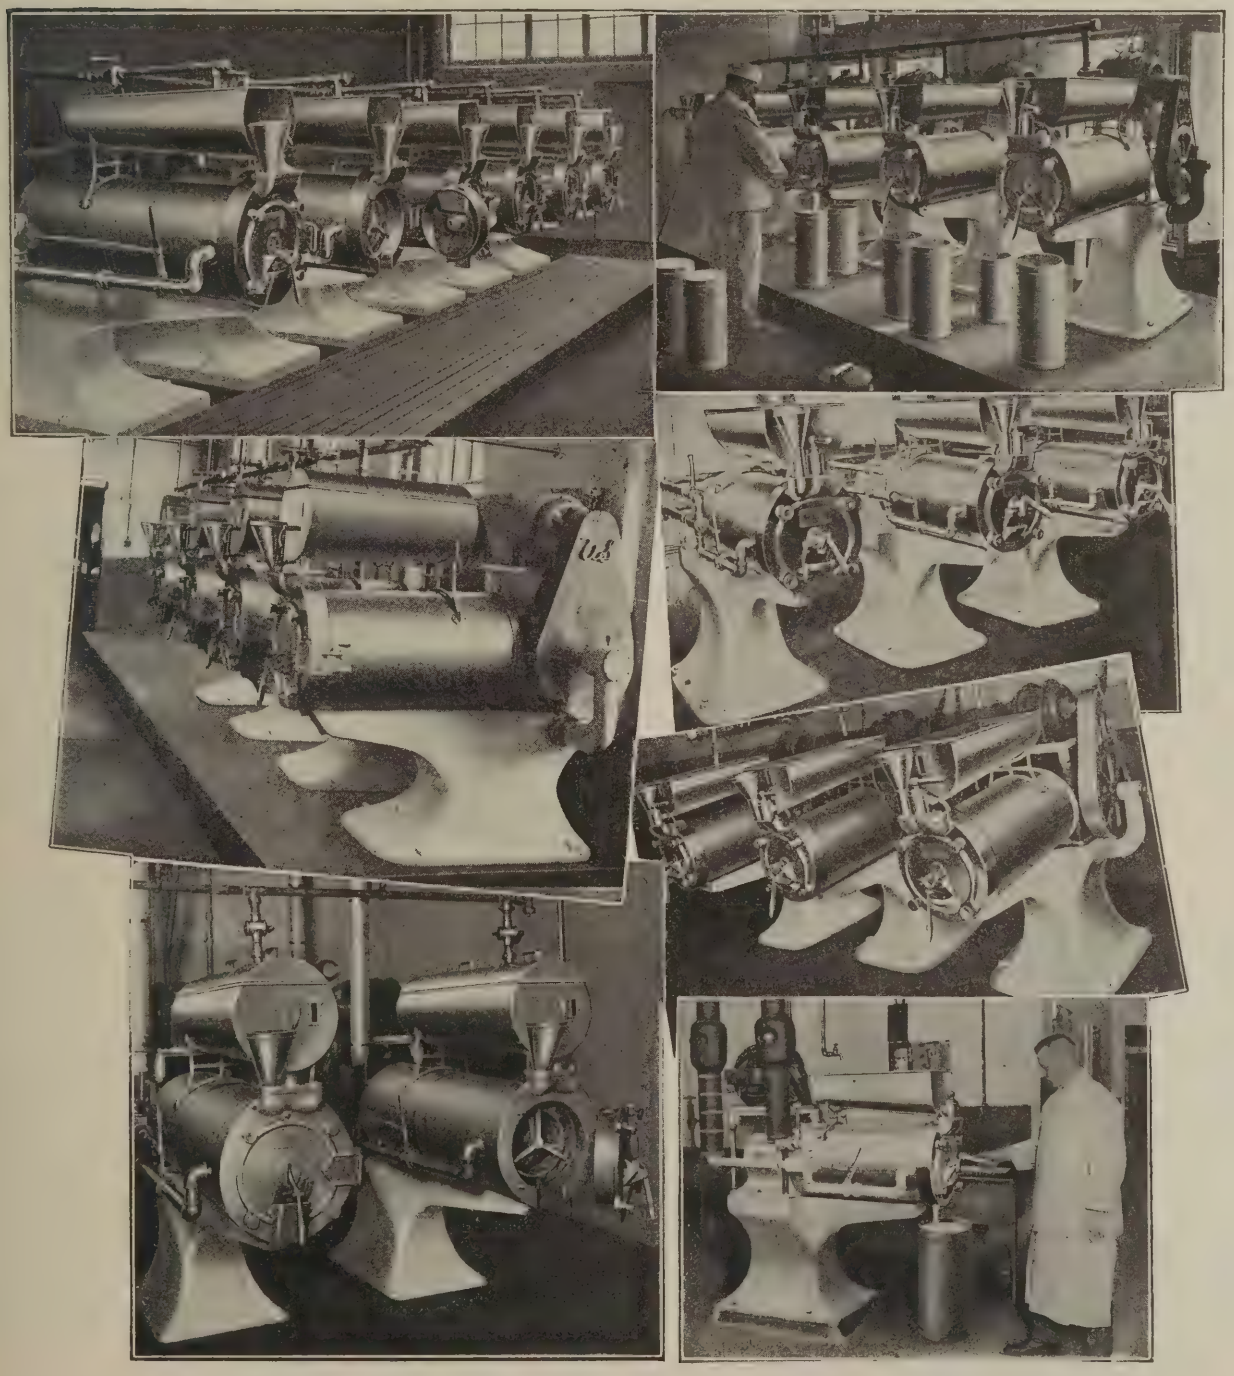
Dear Sir:—How will I be able to build an ice cream mix containing a certain per cent of fat and a certain per cent of total solids. I would like a good formula which can be used in figuring an ice cream mix regardless of the kind of milk products used.

A Review Subscriber.

Reply: A 100 lb. ice cream mix could be prepared regardless of ingredients used. In Table No. 1 this can very easily be done.

Table No. 1.

100 lb. mix, 10% fat, 33% total solids.



Ingredients	Fat	Serum Sol.	Total Sol.
14.0 lbs. sugar	....	.....	13.30
.5 lbs. gelatine	....	.....	.47
85.5 lbs. milk, cream, skimmilk, butter, skimmilk powder, condensed milk, etc.	10.00	9.23	19.23
100.0 lbs.	10.00	9.23	33.00

* * *

Dear Sir:—I am especially interested in how to make the maximum amount of ice cream with the min-

24

imum amount of ice with a continuous freezer and how to harden and store it with ice at the least expense. Would be very grateful for some advice on these points or advice as to where I can get it.

E. W. P.

Reply: As you have no artificial refrigeration in your plant it will be necessary to make the brine in the brine chamber of your freezer. You should use ice and salt in a proportion which will give you a brine temperature of about 8 degrees when you start your freezing and while you are freezing the cream the brine should not go over 10 to 12 degrees. This will mean that you will have to keep adding ice and salt to maintain that temperature.

After freezing the cream the most economical way to harden it is to build a hardening box rather than try to harden your cream in the five gallon tubs. You should put perforated cylinders into this box and then set the ice cream cans into those cylinders which are continually kept packed with ice and salt and when you pull out an old can you can insert into the cylinder a fresh can from your freezer.

* * *

Dear Sir:—We here submit a formula to be analyzed. Your advice for improvement will be very much appreciated. 30 gal. cream, 40 per cent; 30 gal. condensed milk, 8 per cent (very thick); 10 gals. milk, 3.5 per cent; 1½ gals. water to dissolve gelatine; 3 lbs. gelatine; 32 oz. vanilla. F. V. H.

Reply: I noticed that you failed to include the amount of sugar which you use in your mix but I am presuming that you are using 13 per cent. If this is not correct I shall be very glad to figure it out for you in detail. I am showing you below in Table No. 1 how your mix figures out.

Table No. 1.

Ingredients	Fat	Serum Sol.	Total Sol.
30 gal. or 240 lbs. 40% cream.	96.00	12.82	108.82
30 gal. or 270 lbs. 8% condensed.	21.60	48.60	70.20
10 gal. or 86 lbs. 3.5% milk...	3.01	7.40	10.41
1½ gal, or 12.50 lbs. water....	....	.....	.....
3 lbs. gelatine.....	....	.....	2.85
2 lbs. vanilla.....	....	.....	.30
92 lbs. sugar	....	.....	87.40
705.50 lbs.	120.61	68.82	279.98
Per cent 17.1		9.7	39.7

You will notice that you have 17 per cent butterfat and nearly 40 per cent total solids. I am sure that you do not want to make a commercial ice cream of that composition. If you will tell me exactly what per cent of butterfat you want I shall be very glad to proportion the right amount of serum solids and total solids for you.

Dear Sir:—I would like to know how you arrive at solids in condensed milk and skim condensed. I have quite a few confectioners for customers and although I have several books on milk cannot find any total solids to agree with your total solids. Milk at my creamery is averaging 4.8; use 75 cans skim to make 22 cans skim condensed. What should be my total solids? With 2 cans 4.8 milk and 1 can skim or in other words 50 cans 4.8 per cent milk and 25 cans skim milk, 22 cans whole condensed milk, what should fat test be and what should be my solids? H. T.

Reply: You wanted to know how I arrived at the solids in various kinds of condensed milk. The figure which I have been using in answering numerous inquiries are average figures which we have obtained by actually analyzing these products in our laboratory as well as getting average analysis from various manufacturers.

The average composition of sweetened condensed skimmilk is 40 per cent sugar and 27 per cent serum solids. I have figured over from the data given in your letter and have found what the solids of your condensed milk should be and you will find the calculations given below in Table No. 1 and Table No. 2.

Table No. 1.

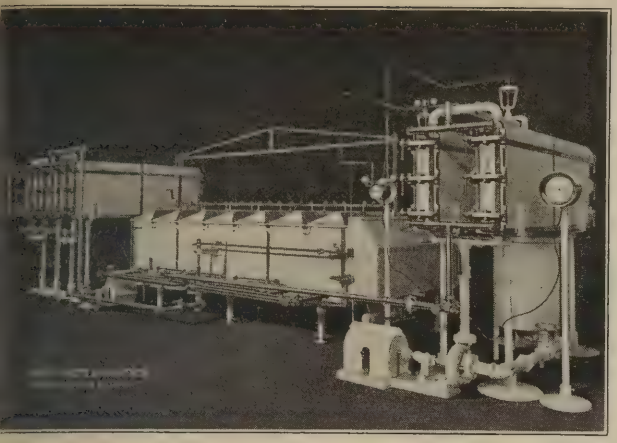
75 cans skimmilk to make 22 cans skim condensed.
75 × 87 = 652.5 lbs. skimmilk.
22 × 9 = 198.0 lbs. skim condensed.
652.9 × 8.9% = 58.1 lbs. serum solids.
58.1 ÷ 198 = 29.5% serum solids in your condensed.

Table No. 2.

50 cans whole milk plus 25 cans skimmilk to make 22 cans whole condensed.
50 × 8.6 = 570 lbs. whole milk.
25 × 8.7 = 217.5 lbs. skimmilk.
22 × 9 = 198.0 lbs. condensed.
570 × 4.8% = 27.36 lbs. butterfat.
570 — 27.36 = 542.64 lbs. skimmilk.
542.64 × 8.9% = 48.3 lbs. serum solids.
217.5 × 8.9 = 19.15 lbs. serum solids.
27.36 ÷ 198 = 13.8% fat.
48.3 + 19.15 = 67.45 lbs. solids.
67.45 ÷ 198 = 34.0% serum solids.

Your whole condensed should then test 13.8 per cent fat and 34 per cent serum solids or have 47.8 per cent total solids.

* * *



Dear Sir:—Please send us a formula for an ice cream mix, 8 per cent butterfat and 34 per cent solids, using sweet butter, sweet milk and sweet skimmilk powder, and the number of pounds of mix we should use to get ten gallons of ice cream. Change the amount of solids if you think best. P. F. P.

Reply: I am glad to comply with youh request for a mix containing 8 per cent butterfat and 34 per cent

Davis Pasteurization.

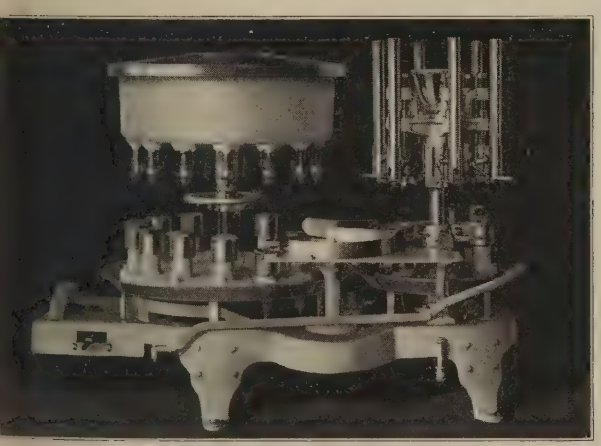
Progress Batch Pasteurizer.

Dairymen's New York Milk Can.

THE dominating position of the Davis-Watkins Dairymen's Mfg. Co. in milk handling equipment for city milk plants is amply recognized—the true evidence may be seen by a hurried visit to half a dozen milk plants in most any city.

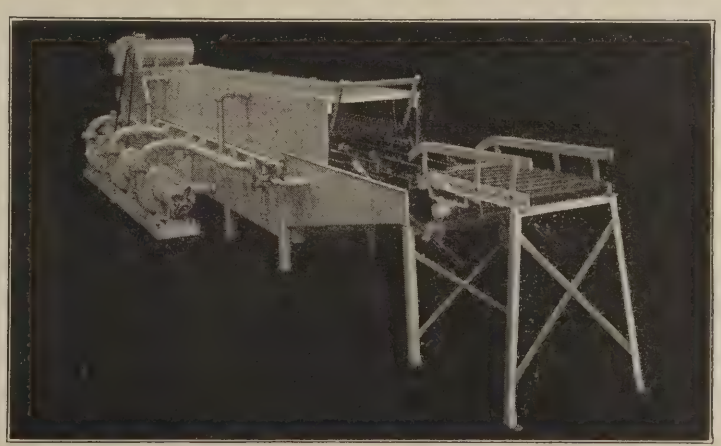
"Davis-Pasteurization" is world famous as the one line of pasteurizing equipment which insures milk dealers "the big cream line, the natural raw taste and the low bacteria count." The "Progress" Batch Pasteurizer has quickly gained prestige in the smaller plants.

The "Davis Rotary" stands at the top in its line. Its supremacy is unquestioned. It is the natural successor of the famous "Davis" case fillers and case cappers.



"Davis Washers" have carried the prize ribbon for many years. They are the economical satisfactory labor and time savers employed in so many progressive milk plants for washing and sterilizing milk bottles.

"Dairymen's Cans" represent par-value all the time. Buyers, who know values, insist on milk and ice cream cans bearing this name.



All these, and hundreds more, are illustrated and described in the Davis-Watkins Catalog No. 6. Send for your copy NOW.

Dairymen's Tiger Milk Can.

Davis Rotary Filler and Capper.

DON'T JUMP FROM FRYING PANS INTO FIRES—CONSULT OUR ADVERTISERS.

total solids. Instead of showing you this mix to make ten gallons of ice cream I am showing it to you to make twenty gallons or 100 lbs. of ice cream. You can readily see why it is more convenient to have it on a 100 lb. basis for on this basis the number of pounds of serum solids, total solids or butterfat are the per cent also of these ingredients.

This 100 lb. mix will make 20 gallons of ice cream weighing 5 lbs. to the gallon. If you can get an over-run of 100 per cent, and this mix will easily stand that much over-run, you will get about 22.5 gallons of ice cream from this mix.

Table No. 1.

Ingredients	Fat	Serum Sol.	Total Sol.
14.0 lbs. sugar	....	.....	13.30
.5 lbs. gelatine	....	.....	.47
6.0 lbs. skimmilk powder	....	5.70	5.70
6.0 lbs. 84% butter	5.04	.....	5.04
73.5 lbs. 4% milk	2.94	6.27	9.21
100.0 lbs.	7.98	11.97	33.72

You will notice in figuring out a formula that the butterfat as shown is a little fraction below 8 per cent and the serum solids also .03 per cent less than 12 per cent. This happens to be this way in order to keep the number of pounds of butter 6 lbs. rather than 6.1 lbs. 6.1 lbs. would make your butterfat just a little over 8 per cent. A good commercial ice cream should contain 20 per cent total milk solids which means the butterfat plus serum solids.

* * *

Dear Sir:—We are enclosing you three batches, of 3800 lb. mixes, and would appreciate it if you would figure these out as follows:

On Batch No. 1, using the figures contained thereon, inserting the right amount of sweet butter to make up the 437 lbs. total fat for mix, using separated or skim for reducing and powdered milk, bring up serum and total solids.

On Batch No. 2, filling in the necessary amount of sweet cream at per cent you may desire to make the 437 lbs. total fat, using skim for two-thirds reduction and powdered milk for one-third of reduction and bringing up the serum and total solids.

On Batch No. 3, same amount of total fat using 900 lbs. of skim for reduction and powdered milk for balance of reduction and bringing up the serum and total solids. The fat content of finished products is 11.5 lbs.; total serum solids 8.5 lbs.; total solids 33⅓ lbs.

Kindly let us have the figure showing the analysis and how you handle same in working out the proposition, as we want to use your method and figures in checking ours very carefully as we are going to handle our mixes with a good deal more care than we have done heretofore. D. F. S.

Reply: You will find below in Tables No. 1, 2 and 3 the mixes analyzed and figured out according to your suggestions for batch 1, 2 and 3. I did not understand, however, relative to batch No. 2 your suggestions stating that two-third skim was to be used for a reduction. I have, therefore, included in Table No. 2 900 lbs. of skimmilk similar to the batch in Table No. 3, thinking that perhaps the suggestion would be of value to you.

Table No. 1.

Ingredients	Fat	Serum Sol.	Total Sol.

Salt Lake City, 355 Pierpont Ave.

Further Reply: I think you can easily reconcile the calculations down to where we have—1,000 lbs. of 25 per cent cream—and you will easily see that by adding the 22.00, 33.00 and 250.00 we obtained 305 lbs. of butterfat. Subtracting 305 lbs. from the total desired, namely, 437, we find we still need 132 lbs. of fat. Dividing this figure by 84 per cent we arrive at the amount of butter necessary, namely, 157.16 lbs.

Then adding the 2.94, 5.87 and 66.70 we have a total of 75.51 lbs. of serum solids. In order to have 8.5 per cent serum solids we must have a total of 323.23 lbs. of serum solids which then makes it necessary to furnish 247.72 lbs. of serum solids from the skimmilk and skimmilk powder. We also found that we needed a total of 1961 of skimmilk and skimmilk powder.

From these figures, using the square methods of standardizing and completing the calculations, we determine that we need 85 lbs. of skimmilk powder having a 95 per cent solids and 1876 lbs. of skimmilk having 8.9 per cent solids. In your conversation I believe that you stated that you wanted 33.5 per cent total solids. This would mean that we would need .57 per cent more serum solids which added to 8.5 would make 9.07. This would mean that more skimmilk powder would have to be used and a little less skimmilk to balance up the formula.

With the suggesitons above I believe you will have no difficulty in making these calculations. I believe that with this information you will be able to make the correct calculations for your formulas No. 2 and 3. If not do not hesitate to write again stating definitely what calculations you want me to show you and I will try to explain them and illustrate them by letter.

You realize very easily that I could do this much more thoroughly if I had your ice cream maker here and assisted him in the calculations which he might want to make as it is sometimes difficult to put down in a letter the exact explanation which is desired.

* * *

Dear Sir:—Will you kindly send me the formula or suggestion for 100 pounds of ice cream mix, containing 12 per cent butterfat, We wish to use the following ingredients: sweet butter, whole milk, unsweetened condensed. I. C. P. Co.

Reply: I am indicating below in Table No. 1 how you might make up the mix from the ingredients stated in your letter. If you do not think this is what you want I suggest that you write again giving me more detail as you did not state what per cent of fat in the whole milk or whether or not your unsweetened condensed milk contained any butterfat.

Table No. 1.

Ingredients	Fat	Serum Sol.	Total Sol.
14.0 lbs. sugar	....	.....	13.30
.5 lbs. gelatine	....	.....	.47
16.0 lbs. unsweetened condensed skim	....	4.32	4.32
11.5 lbs. butter, 84%	9.66	.....	9.66
57.0 lbs. 4% milk	2.38	4.86	7.24
100.0 lbs.	12.04	9.18	34.99

Dear Sir:—Please give me a formula for 100 lb. mix to make a 10 per cent ice cream using 18 per cent sweet cream, sweet skimmilk, 8 per cent condensed milk (Libby's product), sugar, gelatine and flavoring. If one adds crushed fruit or crushed nut meats will it lower the per cent of butterfat? Also send me formula for making chocolate ice cream using above ingredients. T. H. J.

Reply: I am suggesting below in Table No. 1 how you might make up such a formula from the ingredients suggested in your letter.

Table No. 1.

Ingredients	Fat	Serum Sol.	Total Sol.
14.0 lbs. sugar	....	.....	13.30
.5 lbs. gelatine	....	.....	.47
20.0 lbs. condensed, 8%	1.60	3.60	5.20
42.0 lbs. 18% cream	7.50	3.07	10.63
23.5 lbs. 4% milk	.94	2.00	2.94
100.0 lbs.	10.10	8.67	32.54

Relative to your fruit, nut, and chocolate ice cream I may state that the ice cream factories usually use the vanilla mix for making up these various ice creams as the state laws allow a lower per cent of fat in fruit, nut or chocolate ice creams. If you should desire the same per cent of fat it would be necessary, of course, to add a little more cream and less milk which you can easily figure out from the suggestions given in the table.

KEEPS HAWAII INFORMED.

Mr. M. F. Blimm, of the Honolulu Dairymen's Association, Ltd., Honolulu, Hawaii, sent us a postal money order renewing his subscription for four years to THE ICE CREAM REVIEW.

He writes, "I want to thank you for your courtesy in continuing to send the 'Review' after I had neglected to renew my subscription. As you know, we are something over two thousand miles from the mainland and consequently we find your magazine a wonderful source of information in helping us to keep informed as to the latest ideas and new machinery in the ice cream world."

ICE CREAM MANUFACTURERS PLAY MUTT AND JEFF.

A couple of Pennsylvanian ice cream merchants were running an amusing little contest all of their own—it might have been called a Mutt and Jeff serial, for it was between one of the largest ice cream manufacturers of Pittsburg and one of the smallest ice cream manufacturers of Braddock—and it happened just a few weeks ago. And the children of these two towns were just as much interested in the contest as they are in the "funnies" for the war was on their favorite dish—Ice Cream.

Braddockite kiddies came very near having the joy of their lives by being able to purchase ice cream at 19 cents a quart. But the story turned out to be a tragedy from the consumer's standpoint). This is how it happened:

A Braddock ice cream company began placing their product with dealers to be sold at a retail price of 39c per quart brick. The public bought hungerily and merrily. Rival dealers thereupon determined upon getting even with these "favorites" of the consuming public by reducing their retail price to 29c a quart, and this ice cream was from Pittsburgh. The public immediately turned its fickle affections to the new favorite, and they bought and bought. They disgracefully neglected the butcher and baker and concentrated on the ice cream maker and three bricks a day found their way into the homes of the average. The 29c dealers sent hurry calls for truck loads of bricks from Pittsburg and did a land office business.

Then the war broke in Pittsburgh when the news leaked out that the Braddock dispensers of this much loved "manna" were selling the product of their Pittsburgh leading ice cream company at "below cost." The Pittsburgh company had trouble on its hands galore; their dealers in other towns inquired as to why the Braddock dealers were permitted to sell the ice cream at cut rates. And the Braddock dealers went so far as to say they would cut the price to nine cents a brick, if necessary—while the public watched the bulletins on ice cream dispensers' windows, and the kiddies were all planning on a feast royal. Then the Pittsburgh ice cream company's biggest rival got wind of the doings and showed signs of joining the fray. And the Pittsburgh company number one called a halt. Its high official jaunted out to Braddock and had a little war all his own with his dealers and finally restored the market to its equilibrium. Then the official paid a friendly visit to the little fellow, the Braddockite, and they parted the best of friends with ice cream at 39c a brick. And the kiddies party was over.

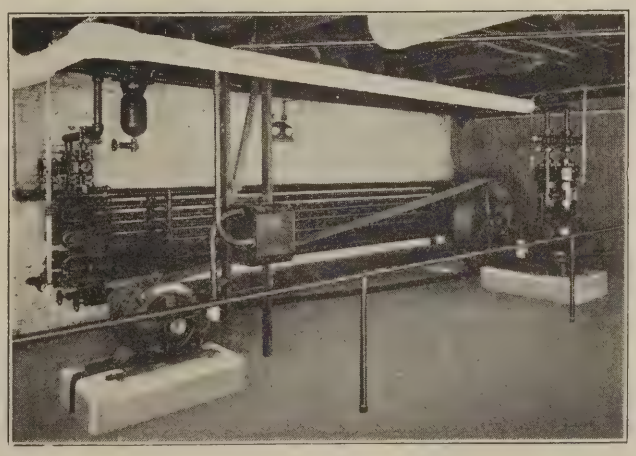
WOULD YOU PAY $20 FOR A DRINK LIKE THIS?

It happened on a railroad train blazing its way through the desert country. The supply of ice water had been drained to the dregs hours before. It was a hot, sultry day and throats became scratchy and hoarse for a refreshing drink of ice water. One man exclaimed, 'I'd pay $10 for a drink right now." Still another, 'And I'd pay $20 for a drink of ice water right now." Porter (ever on the alert) "Yes, sah, for dat money I's get yo all a drink of ice water!" True to his word said water was brought forth and the porter was paid the $30. Soon after he was again offered the same amount for duplicating the order. Still a third time he was urged, but he sorrowfully shook his head and said, "I's done run out 'o ice water—deys no more ice on de corpse!"

Baker Hardening Room

Baker Refrigeration

Making ice cream profitably is a problem of refrigeration—the efficiency and economy of your refrigerating system is all-important.



Baker Refrigerating Engineers understand the needs of the ice cream industry—they know how to design refrigerating equipment for greater efficiency, greater economy and dependability.

With a Baker System especially designed to meet their individual requirements, many smaller ice cream plants have developed big plant methods—low refrigerating costs and increased production has made them bigger. Big plants have grown bigger, too, with Baker refrigeration.

Baker Refrigerating Engineers are at your service—they can solve your problem be it great or small.

DON'T TRY TO SAVE MONEY BY USING CHEAP LUBRICANTS.

What is a Colloid?

A colloid is a substance which, combined with other ingredients, will keep the component parts in equal proportions without separating.

And gelatine is the most perfect colloid known to science.

And Essex gelatine is as pure as is known to modern-day manufacturing.

In your ice cream you need a stabilizer; that which will keep the butter-fat, casein, sugars and other solids in the mix from separating.

Science has established, and use has approved, of gelatine as a stabilizer—as a colloid.

And modern manufacturing methods have established, and use by leading manufacturers has proved; that Essex is an economical, pure, wholesome Gelatine that adds to food value of ice cream. Shipments can be made from Boston, New York, Philadelphia, Chicago. St. Louis and San Francisco,

Member Association — Ice Cream Supply Men

PACIFIC ICE CREAM MANUFACTURERS' ASSOCIATION.

On behalf of the President of the Pacific Ice Cream Manufacturers' Association, Mr. W. V. S. Robb, The Ice Cream Review urges co-operation from the members of this association to help compile suggestions and information for the good of its members:

President's Letter.

To All Members:

As we are now entering the 1922 season, after more than a year of business which was not particularly favorable, due to weather and disturbed business conditions, the time seems opportune to review a few points of interest to all manufacturers.

Removal of Tax. The removal on January first of the well-named nuisance tax on ice cream has met with the approval of manufacturer and dealer alike, and it is the concensus of opinion that it will tend to increase consumption, particularly of cones.

Production Costs. Lower production costs, due to decreased costs of materials, and in some cases of labor, are probable.

The extent to which reduced costs of production should be reflected in your selling prices is a question deserving of serious consideration. Remember that lower prices benefit the dealer only, and does not reach the consumer of ice cream. The ice cream manufacturer is too often inclined to forget that he is entitled to a fair average return.

With an improvement in general business conditions in prospect, and with prices based on a fair value and reasonable profit, there is every reason to look forward to a successful season. But the appearance of your profit and loss accounts at the close of it will be greatly affected by your present actions.

For the purpose of compiling data which may be useful to our members, we would appreciate your advising us as to your present prices and your idea as to what changes, if any, should be made during the summer season.

It is our intention, after receiving replies to these letters, to send out a summary of the information and suggestions contained therein to the membership. Your consideration of the above will be appreciated, and we feel sure that the information and advice you can give us will be helpful to the Association and its members.

Thanking you for your co-operation,

Yours very truly,

W. V. S. ROBB, President.

IOWA FIRMS CONSOLIDATE.

Announcement comes from Nevada, Iowa, that the Nevada Cheese Factory and the Nevada Ice Cream and Butter Co., which recently consolidated, has built a fine new home and operation was begun early in April.

The building is 100x40 feet. The basement is being used for cheese-curing and storage rooms, ice machine room, boiler, coal and salt rooms and also contains a storage room. The main floor is being used for the manufacture of cheese, ice cream and butter.

Investment of about $60,000 represents the building and additions to the plant. Mr. A. Contri is general manager and Mr. C. H. Case is the secretary of the newly formed company. The Ice Cream Review wishes them much prosperity in their new venture.

CROWN FRUIT & EXTRACT CO., Inc.

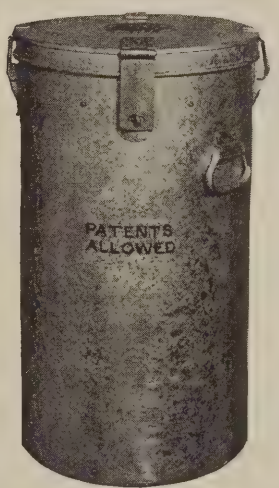
418-420 WEST BROADWAY

New York City, N. Y.

WE RECEIVE AN INVITATION.

The Whitings Creamery of Lake Mills, Wis., has recently completed the installation of an Artic ten ton refrigerating machine and a hardening room large enough to care for 1,000 gallons of ice cream. Their milk room will handle 200 cans daily.

They will furnish ice cream plants and condensories with sweet cream, and those in need of sweet cream can communicate with H. H. Whiting. The cream is standardized to meet your wants and can be furnished in quantities of from one to thirty cans daily.



And on top of all this preparation comes the best part of all—we have been cordially invited to come out to Lake Mills and partake of their famous chocolate coated ice cream bars and also a little H—— B——.

And we answered by return mail to say that when the weather gets a little warmer we'd take advantage of this invitation. We also admonished him to have plenty on hand.

Mr. Whiting is a well-known prize-taker in state and national butter contests of former years, and he has built up a very nice business in Lake Mills in comparatively few years. The butter output is a big feature of the nice income which this creamery nets Mr. Whiting. Before starting in business, he was employed as field man in the dairy division at Washington, D. C.

⚜

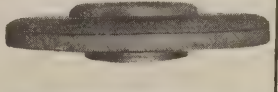
Tell us what you want, or what you have that you don't want, and we'll fix up a little Ad for you and insert it in the next issue of The Ice Cream Review. You just stay at home and wait for results. You'll soon have your hands full.

Saves 10c a Gallon

That is the saving a shipper just reports who uses the

D-C IceLess Express Container

Well hardened ice cream will keep in perfect condition in these containers for 12 hours. We guarantee that, and on the basis of the most trying conditions. In a fairly cool place, 24 hours without ice and still in perfect condition, is nothing extraordinary for ice cream in the D-C Icless Express Container.



What Would it Save for You?

Their light weight gains a remarkable reduction in express charges. Saves ice, salt, tubs and the labor of packing.

D-C Refrigerating Cover { Converts D-C Shipping container into a cabinet. A practical, inexpensive device that serves a good many opportunities for savings and extending business.

Let us send you prices on these containers. We will also show you some practical way in which they help to develop business.

STANDARDIZATION WITHOUT WHICH THERE IS NO PROFIT!

Men are talking it on the street corners, in the factories, and round the conference tables. From the smallest manufacturer, with a few helpers, on up through the big belching factories, whose employees run into the thousands, it is the keynote of all serious conversation. Too long has "special this" and "special that" been permitted a free band with which to squeeze margin beyond all signs of recognition.

Beginning now, TODAY, every one who isn't in business for fun, and who is seriously trying to market a package, whether it be a piece of creamery machinery, a pound of butter, a brick of ice cream, a milk bottle, or what not—is going to look askance at "special" orders. The cost of making even the slightest change from regular specifications is often enormous and out of all proportion to the advantage gained by the customer. Those who insist upon upsetting the routine of manufacture must be made to understand that it is no small favor they are asking, and that they must pay a stiff additional price. Salesmen in every line are urging their trade to get down to brass tacks when ordering and specify STANDARD SIZES and STYLES rather than expect the source of supply to constantly cater to individual whims and strip itself of reasonable profit.

What a relief STANDARDIZATION is going to mean to all of us! You, as makers of butter and ice cream, are in an excellent position to realize the truth of this statement. We, as manufacturers of a line of creamery, dairy and ice cream equipment, have long felt the necessity of such a move. And now public sentiment has taken it up, and the feeling is spreading rapidly from one end of the country to the other. There is a decided opinion that ere long "specials" will be the exception instead of daily occurrences as in the past.

In a recent issue of the "Butter, Cheese and Egg Journal" we note the following paragraph, which tends to bear out this very statement: "The first step the southern California Orange Growers' Association, which is one of the biggest marketing organizations anywhere, did was to standardize their goods in size and quality. When a buyer in any part of the country buys a box of oranges or a carload of a certain size he knows that every orange will be like every other orange, and that they will all be good and sound. That is the reason they have been able to succeed in their selling program."

This last is an excellent cue from which both of us may largely profit. The sooner we adopt and STICK TO STANDARD DESIGNS, that much sooner will the public meet us half way, and transact business on a business basis.—Cherry Circle for March, 1922.

MEMBERSHIP ADDITIONS TO SUPPLY MEN'S ASSOCIATION.

In a certain typographical arrangement which made a paragraph introduction appear, in a casual reading, to be a part of a preceding paragraph, a list of twenty-two companies that joined the Association of Ice Cream Supply Men last year, appearing in the February Ice Cream Review, has been misread by a number of subscribers, we learn, as containing names and companies that had resigned from the Association.

The Association of Ice Cream Supply Men gained notably in membership last year, and we are glad to reprint herewith a list of those members who joined dur-

NEBRASKA ASSOCIATION OFFICERS TAKE PART IN DAIRY ADVERTISING MEETING.

Lincoln, Neb.—A publicity campaign to increase the consumption of dairy products will be undertaken as the result of a statewide conference of producers, distributors and manufacturers called by Leo Stuhr, secretary of the state department of agriculture. The conference empowered Secretary Stuhr to name a committee from the various dairy interests and to appoint more producers on the committee in proportion to the other industries enumerated. The committee will be named shortly. It will be asked to present a program of publicity involving newspaper and other forms of advertising. Over one hundred representatives of Nebraska dairy interests attended the conference. The producers were well represented and took a leading part in its deliberations. J. H. Fransen, dairy editor of the Capper Press; A. L. Haecker, secretary of the Nebraska Creamery Butter Manufacturers' Association; H. D. Lute, secretary of the Nebraska Farm Bureau Federation, and Leonard E. Hurtz, president, and R. W. McGinnis, of the state Ice Cream Manufacturers' Association, were present. A number of representatives of the big milk distributing organizations in the state also attended.

President Leonard E. Hurtz, of the state association of ice cream makers, urged that the representatives of the various interests co-operate in the increase in the consumption of dairy products and leave the matter of the division of profits to properly adjust themselves. Get the business and enhance the demand and then such controversies will soon be settled. He declared that constructive work must be done and that it was high time for the dairy interests to go after business in the same business-like way as the other great concerns of the country.

"Now that we are beginning to realize the big possibilities of co-operation," said J. H. Frandsen, "the dairy outlook can be greatly helped by dispelling the age-old notions that milk, because it is a liquid, is just a beverage, that ice cream is a luxury to be indulged in only on the Fourth of July, that butter is a condiment, applied to bread largely to make it palatable and the more easily swallowed, and that cheese, while a food, is too indigestible except for the woodchopper. These are the reasons why American dairymen have had trouble in securing a market for their products. Incidentally, these are the best possible reasons why they should join hands with the nutrition experts and health officials in an effort to acquaint the public of the marvelous virtues of milk and other dairy products.

"Nutrition experts, school nurses and health authorities in general are doing much to educate the public, but there is much yet to be done because of a lack of funds and of people to preach the milk gospel. It will take much time for such an educational campaign, and it is now highly desirable to take advantage of what all other agencies have done to help dispose of the surplus by a publicity campaign." Professor Fransen gave several examples of wonderful resulis in the use of milk among the public school children.

J. E. Palm, secretary of the Nebraska Dairymens' Association, told what it had accomplished in the past several years in advertising dairy products. Exhibits were put on at county and at state fairs, and posters have been much used in other forms of advertising. Mr. Palm said that the results were extremely gratifying, but the association only had a small sum of money to spend. It was the sense of the conference that inasmuch as the dairy business is the only big business that is not properly organized, that it is now time to act.

MEMBER THE ASSOCIATION OF ICE CREAM SUPPLY MEN

VANILLA AND BLENDS
Exclusively

STANDARD VANILLA AND BLENDS

APPRECIATION of flavor is largely a matter of what the taste has been accustomed to. Musical appreciation may be expressed in a syncopated Southern melody or in a Bach Sonata, depending largely upon the training or environment. And usually the popular Southern melody makes the wider appeal.

So with most things, even the flavor of vanilla. The appreciation of vanilla runs through the whole line of blends and extracts, and quite often, like the Southern melody, a proper blend gives greater satisfaction. It is a matter of taste that has been cultivated.

We cater to the taste, not being content merely to sell, but to supply that particular vanilla, whether blend or straight, that will make the greatest appeal to your trade.

Our representative will be glad to demonstrate this to you.

NEBRASKA WOULD MAKE BRICK.

We wrote to R. W. McGinnis, Secretary of the Nebraska Association of Ice Cream Manufacturers, asking him if he knew of any ice cream factories making nothing but brick ice cream. Here is a part of Mac's reply.

"I am sure you must have had wrong information and if the report was that all the Nebraska Manufacturers would like to make nothing but brick ice cream during the winter months, you would have had the correct dope.

"While the members of our association are working to increase their brick sales and are making good headway it has not quite reached to the point where their trade has all run to that.

"In taking this as one of the subjects up at our district meetings it has been discovered that by pushing the matter of sales of brick ice cream with the retail dealers it has had the proper effect and since the time seems to have arrived when most that we eat (and used to drink) is in cartons, etc., it has in a way helped the sales of brick ice cream in cartons.

"As to our Pic-Nic would say that nothing of a definite nature has developed to date but it will not be until the weather gets warmer and more settled so it would be safe to take a day off and hunt some nice cool grove with a body of water near by and when spring chickens and all that goes with the picnic lunch are about ripe. You will be placed on the list so look out for us."

NORTH CAROLINA ASSOCIATION OF ICE CREAM MANUFACTURERS.

(Additional Resolutions Adopted.)

The following are additional resolutions adopted at the convention which have reached us just recently. These followed immediately those published in the December issue of the Review.

The following amendment was made to Article 10 of the Constitution and By-Laws, being intrdouced by Mr. Cartland of Greensboro, N. C., and seconded by Mr. Landreth of Winston-Salem:

"That the annual dues of each member shall be $25.00, but in the event of more than one Plant of an Organization belonging to the Association, the home office or main plant shall pay $25.00, with the branch or subsidiary plants paying $15.00 each. Each membership shall be entitled to one vote and one representative at each and all meetings of the Association. No firm or organization shall have more than one Director in any one year."

Mr. White introduced the following resolution, seconded by Mr. A. E. Dixon of Fayetteville, N. C.:

"That we go on record as approving the practice at future annual banquets or other entertainments admitting one member or representative from each firm belonging to the Association without charge, but for non-members or guests other than honorary or specially invited guests, a charge shall be made for each plate, pro-rata with the cost of same."

The motion was unanimously carried.

Mr. Cartland of Greensboro, N. C., offered the following resolution, which was seconded by Mr. Baer of Durham, N. C., and unanimously carried by the membership, viz:

"Resolved, that a supply of 'Sanitary Laws' be printed and supplied to the Association members at cost, the Secretary securing the amount required from each member for distribution among the retail dealers."

The following members subscribed:

Arctic Ice Cream Co., Greensboro, N. C....	2,000
Durham Ice Cream Co., Durham, N. C.....	1,000
Chapin-Sacks Corp., Charlotte, N. C.....	1,000
Royall Ice Cream Co., Goldsboro, N. C.....	1,000
White Ice Cream Co., Raleigh, N. C.....	1,000
Lincoln Creamery, Lincolnton, N. C.....	1,000
Forsyth Dairy Co., Winston-Salem, N. C...	500
Catawba Creamery, Hickory, N. C.....	1,000
Buttercup Ice Cream Co., Hamlet, N. C....	1,000
Crystal Ice Co., Washington, N. C.....	200

The following resolution was introduced by Mr. White of Raleigh, N. C., moved by Mr. Carty and seconded by Mr. Landreth, and was unanimously carried:

"Resolved, that the use of any fat or oil not derived from milk, as a substitute for the whole or any part of the milk fats in Ice Cream, is not a legitimate or proper variation of the ingredients which may be used in Ice Cream Mix. Variation, selection and modifications among the usual ingredients are desirable in our efforts to meet the desires and even caprices of our customers, but we condemn the use of any substitute for the vitamine-bearing milk products."

Owing to the fact that the Ice Cream Review is an Associate member of our organiza'ion, it is deemed proper that they become our official organ, and after sundry discussion the following resolution was introduced by Mr. Corning of Hamlet, N. C., and seconded by Mr. Obenshain, Charlotte, N. C.:

"Resolved, that the Ice Cream Review be made the official organ of our Association for the ensuing year, and that they be so notified."

The motion was carried unanimously.

* * *

Section 1, Article 3 of the Constitution and By-Laws, was amended as follows:

When You Know

When you consider the vital importance of sanitary cleanliness in the manufacture of high quality ice cream, and when you further consider the loss to the manufacturer which results from poor flavor and contaminated cream, you easily understand why a rapidly increasing number of successful makers insist on the use of

Wyandotte
Sanitary
Cleaner and Cleanser

in their plants when its cleaning efficiency, dependability, and economy have been widely tried and never known to fail.

Indian in Circle

In Every Package.

An order on your supply house will positively prove this dependable "Wyandotte Service" the most economical you have ever used.

It cleans clean.

THE J. B. FORD COMPANY *Sole Manufacturers* Wyandotte, Mich.

"That no Manufacturer whose product is below the State standard for Ice Cream, viz: 8% butterfat and 31% solids, will be eligible for membership in the North Carolina Ice Cream Manufacturers' Association."

After discussion it was decided to hold our next meeting in December, 1922, and Raleigh was selected as the city, having received six votes, while Charlotte received four and Greensboro only one.

A rising vote of thanks was given the President and Secretary for their efforts during 1921.

Mr. Shuford of Hickory, N. C., Mr. H. E. Cartland, Greensboro, N. C., and Mr. J. H. Baer, Durham, N. C., were appointed on the Committee to nominate the Directors, and the following were appointed as elected: Geo. L. H. White, Raleigh, N. C.; L. A. Corning, Hamlet, N. C.; W. J. Shuford, Hickory, N. C.; A. E Dixon, Fayetteville, N C.; J. H. Baer, Durham, N. C.; H. E. Cartland, Greensboro, N. C.; E. W. Barker, Norfolk, Va.

As there was no further business to come before the meeting, motion was made and carried to adjourn until the next Annual Meeting, of which due notice would be given.

TO EQUIP CREAMERY FOR ICE CREAM MANUFACTURE.

Due to the increase in the business of the Heron Lake, Minn., Creamery, Mr. H. G. Kurrasch has taken Mr. A. C. Schultz into partnership.

The creamery has put in a new vat and they expect to install ice cream manufacturing equipment later. The plant in general is being improved.

The company is devoting most of its efforts just now to buttermaking, although some retail milk and cream business is being handled. They also deal in eggs and enjoy a good poultry business.

101 East Second Street CINCINNATI, OHIO

Wisconsin Association of Ice Cream Manufacturers

Proceedings of the Seventh Annual Convention Held at Hotel Plankinton, Milwaukee, Wis., January, 17th and 18th. 1922

(Continued from March Issue)

President: We certainly appreciate having Mr. Klueter here with us this morning. Would any of the manufacturers like to ask Mr. Klueter any questions?

In connection with vanilla extract, Mr. Klueter, you mention that tonka and coumarin would not be tolerated by the department. What has that got to do with vanillin and vanilla?

Mr. Klueter: The food laws have also defined vanilla extract and have defined tonka extract and have defined flavoring extracts in general.

"A flavoring extract is a solution in ethyl alcohol of proper strength of the sapid and odorous principles derived from an aromatic plant, or parts of the plant, with or without its coloring matter, and conforms in name to the plant used in its preparation."

Vanillin is such a substance, coumarin is such a substance, a natural substance. Therefore, it is perfectly permissible to make ice cream with either of these flavors, by dissolving those forces in an alcoholic solution of proper strength. If you use a mixture of vanillin and coumarin in flavoring your product, you don't have vanilla ice cream. Vanilla extract is made by dissolving the soluble portion of 10 grams of the vanilla bean in 100 c. c. of alcohol in the proper strength. We don't always dissolve vanilla but we dissolve certain ethyl resins and certain other constituents which are very valuable. You all know you cannot dissolve vanillin, which is only one of the ingredients of the vanilla bean in alcohol and get a flavor that is like vanilla. It is not vanilla flavor that is vanillin flavor. Again if we take coumarin, which is one of the constituents of the tonka bean an ddissolve that in alcohol, we have a flavor which is known as coumarin or coumarin extract. The only requirement of law which is not new, but which has been on the statute books, is that when you use those products, the product you sell must be designated as that flavor. If I go into a store and call for vanilla ice cream, I have a right to expect it and I have a right to get it, and the standards for ice cream insist that the consuming public do get it. We have had a lot of experience with flavoring extract manufacturers. Not some of the larger concerns, but every so often some young druggist or chemist discovers he can make a product which he thinks is very much better than vanilla, by dissolving vanillin and coumarin in water and alcohol, adding sometimes a little glycerine and sometimes a little sugar and then adding a li'tle artificial coloring, caramel. What does he add that caramel for? He adds it to this product because the fact that it is colored to look like vanilla extract makes it appear to the sense of taste, more like vanilla extract. They come and tell us it is superior to vanilla extract. It won't bake out, it won't freeze out. My answer to that is this, then if it is so much better than vanilla extract, for heaven's sake why do you want to color it so it will look like vanilla extract? Why not color it green so people can always tell it by its color, and need not confuse it with vanilla extract? It seems to me that is good logic. If I have an article that is better or superior to some other article, I am not going to make it look like that inferior article.

Applause.

President: Are there any other questions you would like to ask Mr. Klueter?

Mr. Klueter, in your department is there any action or anything being done in connection with these—I would not say Greeks—manufacturing ice cream in their basements? Is your department investigating that?

Mr. Klueter: I will have to say that we have been pretty busy and, as a matter of fact, I thought perhaps you people would like to have us let up a little. We have investigated those places as rapidly as we could. We have on the statute book a law which says that, "a place manufacturing ice cream must be licensed." One of the provisions of that law is that if it is a new place, has not been run before, but is being opened, it must not be located in a basement, the floor of which is more than five feet below the street or pavement and that the ceiling of such place must be at least eight feet from the floor and there must be proper ventilation and light. We have increased our inspectional force from two food inspectors to five, and I think we are making good progress along this line.

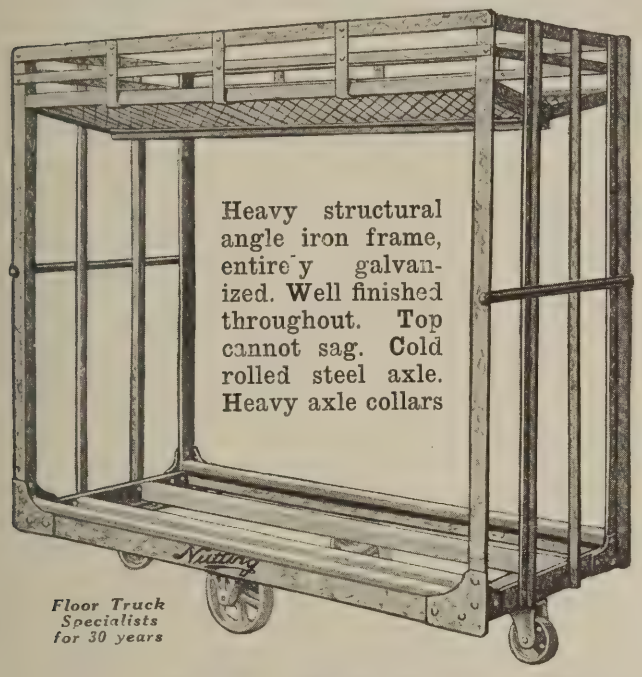
I would like to say just this one thing in addition, and that is I think the ice cream manufacturers of the state are to be complimented on this fact; we have examined many samples for foreign fats, and I am very happy to say, pleased indeed to say, that we have not found a sngle instance where anything but pure unadulterated butterfat has been used.

* * *

SECOND SESSION.

Tuesday, 2 P. M.

Meeting called to order by President Smith.



President: The first on the program this afternoon is "Getting Better Acquainted," by S. J. Duffner, of the Uecke Dairy Company, Eau Claire.

"GETTING BETTER ACQUAINTED."

By Mr. S. J. Duffner, Eau Claire.

About three thousand years ago, the then known civilized world consisted of western Asia, eastern Europe and northern Africa. Even for that time considerable commerce was carried on between these countries. The Mediterranean and Black Seas were the chief avenues of trade used by the Romans, Greeks, and people of northern Africa, while camel trains were used by the people farther east who transported their goods to the westward to exchange them for such commodities as they did not produce in their own countries. Under these conditions, it is almost safe to assume that the "high cost of freight" was even at that time a problem. The city of Jerusalem was located at the crossing of several of these routes between eastern Asia and western Europe and naturally became a city of much commercial importance. It was during the reign of Kings David and Solomon that the Jewish nation enjoyed probably its greatest prosperity and undoubtedly the Jews owed much in the way of prosperity to their geographical location. The caravans from the south and east disposed of much of their wares to Hebrew traders who in turn disposed of them to the people of Europe, including the Greeks and Romans. There lived somewhere to the southeast of Jerusalem, a Queen who had heard from the caravan traders of the Jews of Jerusalem and she marveled at their reports on the magnificence and luxury in which the Jewish King was reported to live. The historian tells us that after a time her curiosity, or shall we say desire for first-hand information, caused her to fit out a camel train and make the journey to Jerusalem in order that she might have first-hand information, and

How to Lower Your Costs of Handling Ice Cream Cans

Floor Truck Specialists for 30 years

DIRTY cans are piled with open end out, which slants them upward and prevents slop from spilling. After washing they are piled up with open end in to drain quickly. All the covers are put on top, held in by the rail.
With this specially designed truck your moving, storing and counting of cans is reduced to a simple, easy job.

Nutting

Ice Cream Can Truck

Ball bearing swivel casters and wide, 8¼ inch main wheels insure easy rolling with the heaviest loads.

to become acquainted with the wonderful King of whom she had heard so much. I am of the opinion that this justly famous expedition was not undertaken altogether as a pleasure trip. I am of the opinion that this hardy Oriental woman had in mind the idea of commercial advantage to be gained by a better acquaintance with the Jewish king and the Jewish people.

The desire for first hand information; the desire to become better acquainted has been one of the most potent factors for progress that the world has known. The hardy Norseman was trying to become better acquainted when he steered his frail craft across unknown seas. It was the same impulse that caused Columbus to cross the Atlantic. Ben Franklin wanted to become better acquainted with electricity when he flew his kite. Tom Edison has delved deep into the unknown of yesterday and his discoveries will be a monument which will live forever. Henry Ford has introduced himself to the world through the medium of his "Lizzie." If a certain monarch who reigned in one of the European countries had made a trip to America prior to 1914 and become acquainted with the American "hurry up" system, German would in all probability not now be the prevailing language spoken in Hades. China made no material progress for four thousand years because she refused to become acquainted with the outside world. Our forefathers to whom we owe the early development of the resources of our country were certainly not averse to taking a chance. And yet in nearly every instance they were repaid for the effort. As they moved to new fields in pioneer days the fishing and hunting improved and fish and game have played a more important part in the development of our country than they are usually given credit for.

Speaking of fishing, I will try to tell you a little incident that happened. There was an old Dutchman who was a good fisherman and he was also a good hand to tell stories. When old John made a trip to the distant rivers, everybody wanted to know about it. One day he was coming back from the river and in passing by a neighbor's house, the neighbor called out, "What luck, John?" John brought his team to a standstill. "Frank, would you believe me, we caught two bushels of fish and two hauls at the same time?" The neighbor said, "No." "We didn't," and then John moved on down the road.

When the pioneer moved to new fields of endeavor he was forced to build a cabin and clear land before he could raise crops and win a livelihood from the soil and the fish-hook and rifle were the implements on which he had to depend until he became better acquainted in his new surroundings. The story is told of a pioneer who with his wife established a cabin some one hundred miles to the westward of the rim of civilization. After living in their new home about two years, one day while hunting about twenty miles to the eastward of his cabin, he heard the sound of an ax. On investigation he found a man building a cabin and a short visit with the new neighbor revealed the fact the man had taken up a homestead and expected to make the place his home. That night when he arrived home his wife inquired why the sorrowful countenance and he explained something like this: "We gotta move again, Ma. This country is settling up too fast."

In the face of established facts, it would seem to me that it is impossible to get too well acquainted with those with whom we must associate. We should be well acquainted with those to whom we sell goods in order to know their needs. It is poor business to sell a man more than he needs and poorer business to sell him more than

he can pay for. The first mistake will cause him to lose money, the second will cause us to lose money, and if we know our customers as we should know them, we may avoid both mistakes.

I belivee that as business people and competitors, it is to the best interests that all become as intimately acquainted as possible in order that we may promote business on the biggest, broadest possible plane. There are fewer industries at the present time with a brighter outlook than ours and any line of endeavor that will call the attention of the public to the merit of our goods should be worthy of our support, for after all the greatest people of all time have not been those who were able to appropriate to themselves the greatest amount of worldly goods and the great number of material blessings but the greatest people of all time have been those who have been able to render the most and best service to their fellow men. Therefore let us not hesitate to do any good thing that we may have the opportunity to do. May we so conduct our business and other affairs in such manner as to merit the confidence of the public, our competitors and all with whom we come in contact. May we make every effort to become well acquainted in the broadest possible terms and may we so conduct our affairs that none will regret having known us. May our conventions and get together meetings promote the warmest friendship and good will. Let us even get well acquainted with our own families and be on speaking terms and hand-shaking conditions with even our own mother-in-law. (Applause.)

President: Next on the program is "Package Ice Cream," by Mr. P. C. Mojonnier, of Mojonnier Brothers, Chicago.

"PACKAGE ICE CREAM."

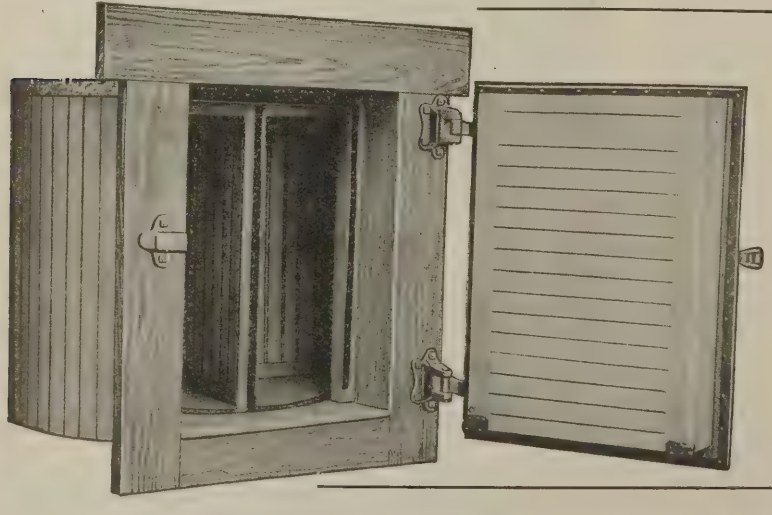
By Mr. P. C. Mojonnier, Chicago.

Mr. President and Gentlemen of the Association: I am pleased at the opportunity to address the Wisconsin Association of Ice Cream Manufacturers and have been kindly assigned a topic, "Package Ice Cream." In arranging this paper, I have endeavored to make it as concise as possible.

For the past several years the ice cream manufacturers in all sections of the country have been dissatisfied with the present method of packing their brick ice cream. At the various meetings of the National Association and at several state conventions which we have been privileged to attend, brick ice cream making has been the topic of much discussion and widely varying ideas. Considerable progress has been made from time to time in perfecting the old method of making brick ice cream, but the majority of ice cream manufacturers have realized that the method in itself was not right and that it would, in time, be abandoned.

In the meantime the sale of brick ice cream, in most localities, has increased by leaps and bounds, but the problem of packing it economically has become a serious one.

Our company has been experimenting for the past three years on such a machine and for two years had several experimental models in a large Chicago ice cream plant where we have constantly and continuously conducted experiments on packing ice cream under factory conditions.



The ice cream manufacturers with whom we worked caught the spirit of the work and co-operated with us splendidly. During this period we have had the opportunity to explode several of our theories and confirm new ones. Mr. E. J. Retzbach, of St. Louis, who has been experimenting along similar lines for about seven years, and who has been granted basic patents on packing ice cream, worked with us, perfecting the machine. In developing the packaging machine we have had many problems to solve, but we can assure the ice cream manufacturers that we have solved the problem of successfully packaging ice cream, as it comes from the freezer in various sized cartons, and colors, and at the same time not reduce the overrun, thus preventing shrinkage, and preserve the straight lines on individual serving, also deliver an equal quantity of flavor of ice cream, even though the viscosity of each flavor is different.

By process of elimination we have developed the present type of the packaging machine which we are now offering.

A word as to what the Mojonnier ice cream packaging machine does. It fills automatically either one quart or pint cartons with one ,two and three flavors of ice cream at a time. It receives the plastic ice cream from the freezer and packs a definite amount directly into the cartons. These filled cartons are then transferred to a container holding 24 quarts and this in turn is transferred to the hardening room. There the ice cream is hardened in the carton ready to deliver to the trade. Nothing is taken for granted in the packaging machine. It is positive in its action. It is of the forcefeed type. A definite amount is drawn, by means of a simple one-piece vacuum valve, this same valve discharges this amount in the desired package. In this connection let us digress to the point of saying that all successful machines have been those positive in action. Among these machines might be mentioned the evaporated milk filler, the milk bottle filler, the telephone, the automobil, etc.

Wtihout a question this packaging machine is out of the experimental stage. Our engineers after repeatedly experimenting on various types of machines and methods of filling packages, found that nothing but a positive feed could be depended upon, as the condition of ice cream as it comes from the freezer varies so much in thickness, in weight and in viscosity. Consequently, they evolved slowly the force feed principle. This has been perfected so that there is no loss of overrun, no shrinkage, full measured quantities of either chocolate, strawberry, fruit creams of any kind, vanilla or sherbets are deposited in each carton. The force feed principle assures each carton being filled with the measured quantity of ice cream. There is no guess work in any operation. It is based on sound mechanical and engineering principles. It handles either soft or stiff ice cream in measured amounts with equal layers. The machine was originally designed to fill the standard open end cartons, quarts or pints. However, with adjustments furnished with the machine it will also fill either round cartons or the "Sealright" type, carry-home pails in pints or quarts or individuals (approximately 1-8 of a quart). It could be styled a universal filler as it will fill any package within reason. The cartons may be used with or without parchment liner as desired by the purchaser.

As to the advantages of this machine. There are so many advantages over the old system of pouring into the slabs, hardening, dipping, cutting, wrapping and rehardening that it is difficult to emphasize the more important ones. The bricks are exact quarts or size desired, no more, no less. The cream has a far better flavor and texture when made into bricks by this new method. The plump, full-measured bricks have been compli-

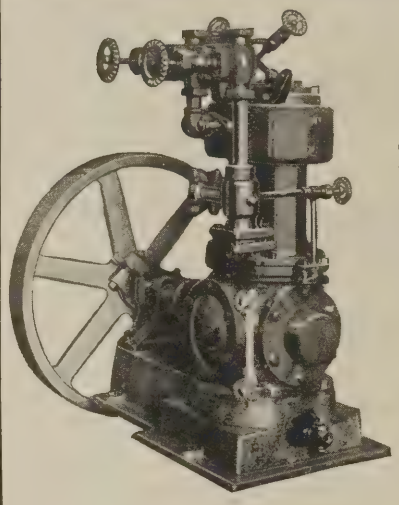
MONEY—MONEY—MONEY!

A worthy thought that, but—

before you go too far, let's figure what is slipping away in good will and lost patronage when you chase the elusive dollar in an ice cream formula.

Maybe you can save a few cents a gallon by making this change or that. But you're bound to get a different kind of gallon with every change.

Take the milk, for instance.



That offers grand opportunities for manipulating prices but—when you do that you play with the quality at that very same moment.

You can be sure of the best results (it has been proven) and you will find the price lower, quality considered if you will use

Quality and Prices always right.

mented by both the dealer and the consumer. The sanitary way in which ice cream can now be packed is so far above the old method that a comparison can hardly be made. Another advantage from the manufacturer's standpoint is the saving in ice cream that is effected by the new method. Under the old method, there is usually a loss of ice cream while transferring from the freezer to the mould, due to slopping, also frequently moulds are oversize to allow for cutting. There is a loss in cutting the slabs. Conceding upon a most conservative basis the loss will run from five to ten per cent. It is a great labor saver enabling one to make bricks with the same help that turns out bulk ice cream and with no longer a period of time consumed in filling the moulds the old fashioned way. The new package wherever placed has met with the instant approval of ice cream distributors. It is a well known fact that ice cream should not be exposed to the air, such exposure affects the delicate flavor and texture and unless extreme care is taken, an ice crust is formed during the re-hardening after the dipping and cutting operation. The automatic packaging machine entirely eliminates all ice crusts, seals the delicate flavor and aroma right into the carton and prevents exposure to the air until it reaches the table of the consumer. The texture and smoothness of the product is unexcelled when ice cream is filled directly into the cartons by means of the packaging machine. The ice cream is not touched by human hands, the good flavors are all sealed in. The possible bad flavors are all sealed out. These are arguments upon which the manufacture can capitalize in his advertising and sales promotions.

As to the description of the machine. The ice cream packaging machine is manufactured in two models of different capacities. Model "A" hopper capacity is 90 gallons, 30 gallons in each of the three compartments. It will fill automatically 1,200 quart cartons per hour in either one, two or three flavors. This can be increased or decreased, if desired. This machine is operated by two persons. Model "B" hopper capacity is 45 gallons, 15 gallons in each of the three compartments, capacity 900 quarts per hour. This can be slightly increased or decreased if desired. It requires one person to operate it. In both cases the operator closes the cartons and places them in the carry out tray. The hopper is made of a heavily tinned copper and jacketed. The jacket contains a brine coil and felt insulation. Ice cream has been held as long as four hours in this hopper without injury to the product. The construction of the hopper absolutely prevents any change in the ice cream during the packaging process. The revolving table has carton holders designed to hold practically any type of carton. These are furnished with the machine. The motor and gearing are enclosed under a tinned copper hood which may easily be lifted to permit accessibility to any working part. It is built extremely heavy and durable. It occupies a floor space about three and a half feet by eight feet.

How it works. Ice cream is drawn from freezers into five or ten gallon cans and from there poured directly into the hopper of the filling machine. The machine is electrically driven with a one horse-power motor which is furnished as part of the regular equipment. After starting the machine in operation the cartons are placed in the holder upon the revolving table. As each carton is drawn under the discharge openings of the hopper a plunger automatically discharges an exact measured quantity of ice cream into the carton. If perchance for some reason there is no carton in the holder, no ice cream is lost as no ice cream will be discharged unless

there is a carton to receive it. The machine may be very readily taken apart and cleaned due to the simple construction and the fact that all parts are accessible.

In general. One of the greatest possibilities in the use of our packaging machine is that of packaging bulk ice cream. Quite an extended investigation of this was made by some of our representatives during this fall and it was the concensus of opinion among the drug stores and other distributors of ice cream who were interviewed, that they favored the selling of packaged ice cream rather than dishing out and selling bulk ice cream over the counter, that they would rather have the factory do the packaging than to have heir clerks do it or do it themselves. In fact, one large dealer in Austin has for the past year had all of his ice cream that he sells over the counter packed at the ice cream factory. He states that he could sell it for much less than he could sell equal packages of ice cream and still make a satisfactory profit. He states that he could make a sale in much less time than by dishing the ice cream from the can and packaging it himself. One large dealer in St. Louis reported that on a sale of 70 gallons of bulk ice cream he figured that he gives away more than $3.50 of his profits, or a distinct loss of $3.50. Had this ice cream been packaged at the ice cream factory and sold by the dealer at 10 cents a quart profit, on these 70 gallons or 280 quarts, he would have realized a $28 profit instead of $3.50 loss. In the canvass of the dealers it was found that practically all of the dealers are of the opinion that a standard pint and quart carton could be used instead of the present carry home pails now used to package bulk ice cream. This they claim is due to the fact that ice cream from the square or rectangular shape cartons can be served in much more pleasing form than when dipped from the carry home pails.

Every dealer interviewed admitted that bulk ice cream packaged at the factory means to him an assured profit per package and more time to devote to sales. They were unanimously of the opinion that the logical place to package bulk ice cream is at the factory; that the consumers who buy ice cream for home consumption always receive it in package form anyway, and it is a question as to where the packaging should be done. All were unanimous that the packaging could be done much more economically and in much more sanitary manner at the ice cream plant than in the store of the druggist who may be trying to wait on four or five customers at the same time.

One ice cream manufacturer assumed this attitude. "What do we care if the dealer does lose by giving overmeasure? It means more sales for us." However, we feel that upon close analysis you ultimately will agree with me that this viewpoint may lead to erroneous conclusions. The whole fabric of commerce and of human endeavor in its many branches is predicated upon the little word "profit." If the dealer cannot make a profit on the sale of bulk ice cream, eventually the manufacturers will feel the effects of it. The fact that the dealer is even now charging from 30 to 40 per cent more for bulk ice cream than for brick ice cream means reducing the sale of bulk ice cream and in fact reducing the sale of ice cream. Increase in price will decrease the demand or a decrease in price will increase the demand, are the economic rules that govern the world over. Another great advantage of packaging bulk ice cream is that the package will reach the consumer or ultimate purchaser under the manufacturer's own label or trade mark. This prevents substitution. By a little constructive advertising the consumer will soon learn that bulk ice cream packaged at the factory has the same flavor and texture

Patent 6-29-1920—Patents Pending

When The Botton GOES

There is another lease on the life of your tubs left if you

Use The

Frick Bottom Hoop

With this hoop you can replace bottoms that are out, or repair weak bottoms. Making them stronger than when new. In either case, your tubs if equipped with Frick Hoops will last two or three times longer than a new tub of the present type.

This is not a cheap repair job but a permanent improvement. We use heavy rust-resisting metal and hot galvanized after hoop is made complete.

Write us today for further details and prices.

Frick Hoop Company
Corsicana, Texas

PACK YOUR ICE CREAM IN THE RIGHT KIND OF CANS.

as bulk ice cream from the dealer's cans. Advertising packaged bulk ice cream to sell at the same price as brick ice cream would be bound to increase the consumer's demands for ice cream. To realize the best possibilities under this method of procedure would require the close co-operation between the dealer and the manufacturer.

The same problem has been encountered in nearly every other good product. It seems but a few years since packaged oatmeal, packaged soda crackers, packaged butter and dozens of other packaged products were known. It has been only a few years since bottled milk has been the rule. Selling to the consumer goods packed in packages or containers is now the rule.

I thank you, gentlemen. (Applause.)

(To be concluded in May issue)

NATIONAL FARM ORGANIZATIONS DEMAND TARIFF PROTECTION FOR AMERICA'S GREATEST INDUSTRY.

Farm organization delegates from fifteen different states made a concerted, eleventh-hour effort today to obtain a pledge from the Senate Finance Committee that tariff protection would be given dairy products, fats and oils, against the deadly Oriental and South Seas competition which threatens if the tariff oil schedule goes through as it now stands.

They savagely attacked the so-called "Soap Lobby," declaring its demand for duty-free vegetable oils would sacrifice the prosperity of nearly 40,000,000 farmers and endanger the $70,000,000,000 capital now invested in American farms and dairies.

At a conference in the Harrington Hotel, the farm leaders elected F. P. Willits of Philadelphia chairman and Charles W. Holman of Washington as secretary of their committee, and committed themselves to unrelenting warfare against the policy of "free-listing" farm products. They openly threatened to carry their fight to the Senate floor and even to the election polls if necessary, to gain their end.

After prolonged discussion of the situation with friendly western senators, they went en masse to the Capital, sponsored by Senators Gooding and Capper of the farm bloc, and were given full opportunity to state their case by Chairman McCumber of the Senate Finance Committee.

Senator Townsend read a bundle of telegrams just received from Michigan dairymen and farmers and agricultural college experts, which denounced the growing tendency for substitution of cheap vegetable oils in daily foods, referring especially to "oiled" milk, lard compounds, salad dressings, filled cheese and the like.

Senator Lenroot spoke strongly of the farmers' need for protection against the cheap Oriental labor which can be hired for five and ten cents per day, saying: "The soap makers are chiefly afraid that they will lose their large export trade if they do not get these cheap vegetable oils. But the home trade comes first. The importers and exporters oppose this duty for fear other countries will retaliate with higher duties. But if that practice is started, we can adjust our tariffs against imports so as to make them wish they had not."

Senator Capper vigorously urged the need of "protection" for agricultural products, saying: "I have absolute confidence in the justice of this appeal by this delegation of farm organization leaders. This committee should give its most generous consideration to farm interests which have suffered exceedingly and need all the protection that can be justified."

Chairman McCumber of the Finance Committee seemed to agree with the trend of thought by saying: "It seems hardly proper that one section of the country should live under the protection of high duties while another section of our people should be forced to meet the competition of the world's free trade." He inquired if the farmers' committee would favor a tariff that taxed vegetable oils destined for food uses, but admitted free such oils as would be used in soap-making.

C. F. Creswell, statistician of the Dairymen's League, presented evidence showing the immense amount of soya bean oil, copra and cocoanut oil, peanuts and peanut oil which would flow into this country from Manchuria and the tropics where the Yellow and Brown Races have well developed and growing industries.

Albert Manning, master of the New York State Grange, stated that the farmers of America desired to enjoy the same comforts and standard of living as city folks, but that with a free inflow of fats and oils, the American farmer could not prosper and would have to stop producing so many hogs and the corn to feed them; would reduce his cotton crop and give up the new soya bean projects which are now replacing much corn acreage in the middle west.

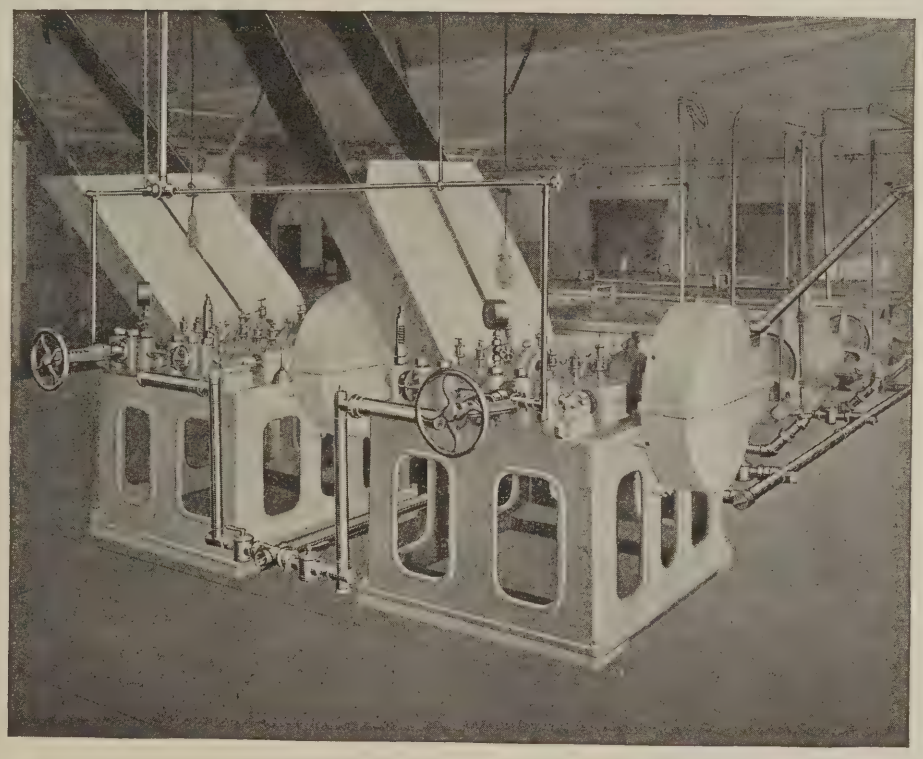
Fred Shangle of the Inter-State Milk Producers' Association gave figures showing that duty-free oils would benefit only a few people in this country, namely, "348 soap-makers, employing 28,726 people; 42 oleomargarine makers, employing 3,866 people; and the meat packers who make half as much oleo as the other 42 concerns; a few oil refiners and importers."

He declared that the total oleo output was about 374,000,000 pounds only compared with 1,500,000,000 pounds of butter produced by farmers, and that according to the 1920 census, the oleo industry had an "actual value of only $250,274,786 as compared with $70,000,000,000, the actual value of our farms and dairies." He demanded that the Senators go on record as to which industry deserved the most consideration.

The Senate Finance Committee has received about 25,000 letters from laundries and grocery men, instigated by the "soap lobby," according to Senator Calder, so a bitter contest is expected by the farmers.

ROSS JOINS THE CHERRY FORCE.

J. J. Ross, well-known among ice cream manufacturers in the Central West, has taken up his duties as traveling salesman for the J. G. Cherry Company, of Cedar Rapids, Iowa.



Mr. Ross is to travel the Northeastern Iowa territory.

For seventeen years Mr. Ross made butter in Iowa; and he was a member of the Dairy and Food Department for nine years. He is well versed in the marketing of butter, as he was at one time employed by the Enyard & Godley Company and the Gude Bros., Kieffer Co., of New York City. During 1919 and 1920 he was employed by the Diamond Crystal Salt Company, and during 1921 he was salesman for the creamery machinery and supply department of the Hawkeye Supply Company of Mason City, Ia.

His many friends in the Iowa territory join with us in wishing Mr. Ross success in his new position.

Send news items and personal notices to the "Review" and see how well they look in print.

Breyer's Homogenizing Plan
Includes Two
GAULIN Homogenizers

A FEW may equal but none can surpass the quality of ice cream produced by the Breyer Ice Cream Co., Philadelphia. After experimenting with others they have standardized on Gaulin Homogenizers and every ounce of the mix producing 4½ million gallons of ice cream in a year goes through these two machines.

The Breyer Ice Cream Co. has the reputation of being one of the most efficiently managed plants in the country and their decision in favor of the Gaulin was based on careful tests. It speaks volumes for the efficiency of this homogenizer.

Most of the other plants in America producing quality ice cream have also standardized on Gaulins. They have learned that while a good ice cream maker can produce good ice cream with ordinary equipment, the same man can produce better ice cream and do it easier with a Gaulin. Every particle homogenized in the Gaulin must pass through the Gaulin Spring Homogenizing Valve which crushes it under a pressure of 4,000 lbs. Furthermore, the spring valve feature prevents clogging of the valve as is the case with rigid valves as found on ordinary machines purporting to do what the Gaulin does.

INSEPARABLE COMPANIONS—THE KID AND THE ICE CREAM CONE.

Pacific Association of Ice Cream Manufacturers

Proceedings of Annual Convention, Seattle, Wash., November 14, 1921

The convention was called to order by President Dunne at 12 noon.

Mr. Dunne: Dr. H. M. Read, health officer of the City of Seattle is going to extend to us an address of welcome on behalf of the Mayor of Seattle who is unable to be present. I take pleasure in introducing to you Dr. H. M. Read.

Dr. H. M. Read: Ladies and Gentlemen: I am sure it is a great pleasure for me to be delegated on behalf of His Honor the Mayor of Seattle to say a few words of welcome to such an estimable body of representative business people and to welcome you to Seattle on behalf of the Mayor and its citizens.

You represent a branch of industry of this country that means a great deal to its people. You represent a branch of industry of this country that means a great deal to the health of the people. You are offering and producing and placing before them that which will be of a great deal of importance to them in health and of vastly more importance to them in certain types of illness. I speak advisedly as a physician of some years of practice and as a public health officer.

The history of the ice cream industry is very old in this country as you all know. Any of you who have ever read an old novel called "Elsie Vennor," written by Oliver Wendell Holmes, will find probably the first allusion to ice cream that was ever made in literature.

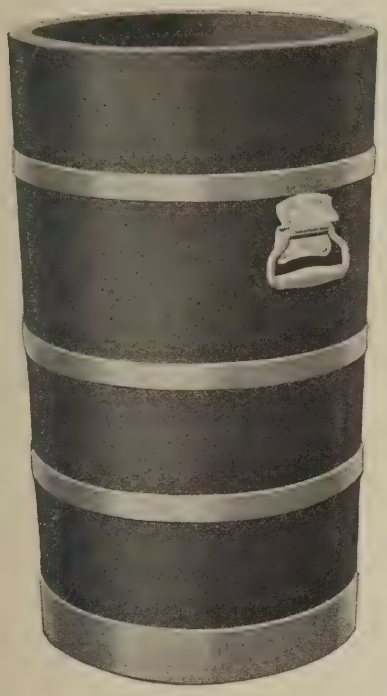
It is growing in importance as a food product and fills a place in the armature of the doctor that cannot be replaced were it to be taken away. Therefore I trust that nothing will be done here or will ever be done to place any serious embarrassment in the way of the promotion of the industry you represent. We as health officials have only one interest and that is in the purity of the product.

I am glad to say that in Seattle it occupies a very high plane in that respect, and I am sure that the intelligence represented here today by the presence of you men and women is a sufficient guarantee that it will maintain its purity and high standing.

Again let me thank you for the privilege of saying these few words. Of course I cannot do as well as His Honor the Mayor would have done in welcoming you to the city, but I extend to you a most hearty welcome and best wishes for the success of your convention. I thank you.

Mr. Dunne: Dr. Read, on behalf of the Pacific Ice Cream Manufacturers' Association, and on behalf of the National Association, speaking through Mr. Martin, delegated for that purpose, and on behalf of the gentlemen and ladies present, I want to thank you for coming here today and extending this welcome, and in doing so I wish to assure you that nothing will be done at this convention to lower the standard of our product or in any way to make it other than highly nutritious and healthful to those consuming it.

We are pledged as a unit in behalf of the making of a properly regulated ice cream and in addition to that we stand for all of those things that make for perfect sanitation in our plants, good treatment of our employees, which means satisfied employees and consequent loyal service, and in addition to that we are standing absolutely and unqualifiedly against anything that will tend toward the substitution of anything for those vital elements that have tended to raise the standard of ice cream and make it favored by the medical fraternity. We thank you again, Doctor.



Folks, we are now going to eat and we will not have any more talks until we get through. We want you to meet your neighbors and to get acquainted with them and we thought this would be a good way to break the ice. The registration was a little slow, and that is the reason we thought we would start this thing out in this way. But we are going to start the program on time, and I think the rankest discourtesy on the part of the members of the convention toward those who have gone to the trouble to prepare papers is to arrive late, and from now on when anyone comes in late we are going to sing them a little song which runs something like this, "Come in, come in, come in, you're late, sit down." And any man that is not on time will be given that kind of a reception. We will give it to you in good plain English so there will not be any misunderstanding about the fact that this meeting is going to be called on time and we expect the courtesy of every man's presence at the appointed hour because these speakers have gone to a lot of trouble to prepare their papers and you must show them the courtesy of your presence on time.

(Whereupon the members present partook of a luncheon. At the conclusion of the luncheon at the hour of 1:30 o'clock P. M. of said November 14, 1921, the meeting was opened by all present rising and singing "America.")

Mr. Dunne: It now becomes my pleasure to again address you with a long drawn out speech, and if I take a lot of time, please do not mind it, because I wanted to say a number of things, and I have put it in

writing and if you will excuse me for imposing upon your time I will now read my address to you.

I urge that all in attendance do the speakers the courtesy to be prompt in your arrival at the speaking time and give your attention to the paper that has been prepared.

You will find pages in the back of the program for making notes, and these should be used for your own records.

If you knew the time these men give to their papers and the job it is to prepare the facts to properly present them to you you would feel it a duty to be here and listen with attention to some of the gems of experience related.

Again I have the privilege of addressing you in an annual address, and review the conditions that have prevailed during the past year in the industry, as well as relate to you the part that our organization has performed.

ADDRESS OF PRESIDENT DUNNE.

History of the Year.

The organization, as you will notice by the secretary's report, has made a satisfactory growth.

The majority of the ice cream manufacturers of the Pacific northwest now belong to our organization. We have legislative committees in each state.

In Oregon, this past year, an effort was made to raise the standard from 8 per cent fat to 12. The legislative committee of Oregon succeeded in defeating this amendment.

In Washington a similar bill was proposed—was referred to a friendly committee, and killed there.

In the state of Idaho, the association went to the then secretary of the Oregon Dairy Council as a representative to Idaho, for the purpose of trying to do something in the way of bringing about favorable legislation in behalf of the amendments desired by the manufacturers of Idaho, but we were not successful, due to the fact that a quarrel broke loose in the house on other matters, and we were not advised in time so that we could overcome it. We sent a representative twice into Idaho for the purpose of assisting wherever it was possible, but failed in our attempt.

We recommend that the people of Idaho present this matter again this year, and that they obtain pledges of the different senators and representatives before they are elected this year, so that they will thus have "friends at court."

We propose, still further, that Guy Helphrey of Northern Idaho present himself for election, because we are assured by those from Idaho who know him that he could readily be elected, and thus bring about a satisfactory adjustment of the conditions in that state, so that the ice cream men would be represented fairly.

Note: Montana has a 10 per cent ruling by its health officers.

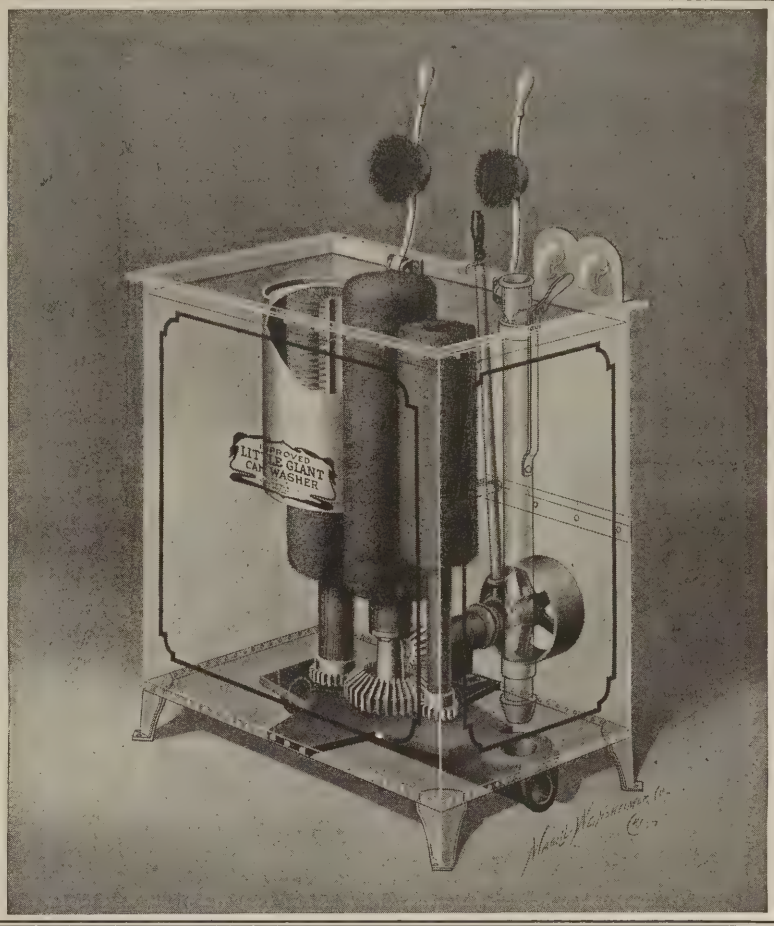
Secretary.

It is needless for me to tell you about the work of your secretary. This you are already acquainted with. I must take this moment to compliment him upon the efficient work that he has done in the years that I have been the head of the organization, and the long term for which he has served you, at the expense in many instances, of his own time and money. I feel that it would not be fair to make a report to you without paying particular tribute to the genial secretary, who means as much to the ice cream men as Johnnie Walker does to the men who used to drink it in the long time ago.

We Know You Wash Your Cans

But are they clean? Even though satisfied that your present method of washing cans is all right, investigate the merits of the

IMPROVED LITTLE GIANT CAN WASHER



not because we say so—no, indeed—but simply because we know you are interested in learning of any new method which will effect a saving and wash your cans—Quicker—Cleaner and Cheaper than any other method. That's just what this machine does. All sizes of cans are washed—inside and outside—at lightning speed.

For good Ice Cream Cabinets — Ask us about the Arctic Steel Ice Cream Cabinets

Express Hearing.

We have succeeded in winning our case on ice cream rates in the state of Oregon, shipping for less money than any other state in the United States. We were able to convince the Public Service Commission that the rates that were proposed by the express company were unfair and unjust and without reason. They held with us. This is one specific case where men prepared and handled the case intelligently. It went before the Public Service Commission, based upon facts and figures in our business, hence we held our original rates and weights.

In other words, you are paying, whenever you ship ice cream anywhere else in the Union, on the basis of 115 pounds. In Oregon we are still paying on the basis of 100 pounds, which means we are shipping our ice cream within the state for 43 per cent less than anywhere else.

Necessity of New Express Rates.

We believe that it is time now that action should be taken by the National Association, and I should like to have a memorial prepared by our association, asking that our director take up before the National Association, and ask that the Executive Committee get busy and do something for the purpose of reducing the rates on express. I shall be glad to have you make a notation in the book, so that at a later date, when we get into business session, a memorial can be prepared, and I respectfully request the resolutions committee to make note of this, so that a proper memorial can be drawn and presented at this convention, then sent on to the National Association, asking that special attention be given to the reducing of rates until they are brought to a reasonable basis.

Board of Directors—Divisions With Director to Lead.

During the past year, another association has been formed of those people connected in and around Seattle. This plan leads me to offer a suggestion that probably will work out very satisfactorily. I think the Pacific Ice Cream Manufacturers' Association should have units represented in this locality, and headed by the director of the locality which is thus represented. I believe it will succeed in bringing about a bigger and better co-operation, and make it possible to have more subjects come up, handled in a better manner, and leave it possible, in turn, for the member of the Board of Directors from your particular locality to make a report to the Board of Directors of your Pacific Association, and let them have the benefit, or aid, in case of need, in any particular thing that is worthy the consideration of this board, that is brought before them at the request of any of the sub-associations.

Legislation.

These associations could in turn appoint their own legislative committees for their own respective communities and suggest them to the Board of Directors of the Pacific Association, and have the complete co-operation and support, that would result in better work and greater representation. We could correct any legislation that might be offensive, and put in whatever legislation that is necessary.

Legislative Needs.

We had in Oregon, and upon investigation this year, were somewhat surprised to find that through some inadvertence, the clause was stricken out of our law after we thought it was passed, a provision for a five-day return for our empties. This should be incorporated by every state in the northwest in its new demand for the new legislature for the coming year.

We have a representative from Utah here, and we shall be glad to hear from our friend from over there, as to the results they succeeded in obtaining in their legislature. In the early part of the year we sent them a copy of the Oregon law, but did not hear from them again.

Need to Support National Association.

It is needless for me to urge you to support the National Association in every way, and to urge that all who are not now members of the National Association lend their support to this great effort, by becoming members of this association, the applications for which are in the hands of the secretary and on the president's table, and will be handed to you at the conclusion of the first meeting.

Taxes.

I would like to have a memorial presented to the National, also, concerning the tax and depreciation allowed in the income tax returns. I believe that this is a vital question, and we should dwell upon the necessity of having a greater depreciation in our business, on account of the fact that the brine is more destructive upon trucks than in any other business. I would like to have the best brains of this association make notes of this and draw up suitable resolutions, that these in turn can be presented to the National for its consideraion.

The Nuisance Tax, which is the 1 cent tax on cones, should also be abolished, at once, and we must urge the National to give strict attention to this, and see that no other tax is forced upon us that will be dangerous to the industry.

Wages of Men.

The wages of the men in our business continue to be high in the face of what they were before the war. I believe that the wages in our business are now at a standard that may suffer from loss in the next little while, but on the whole have been raised much above what they were before the war, and will continue to be so.

Drivers' Wages—Co-operation.

Many men are succeeding in having much support from their drivers by paying them a commission on sales of merchandise other than ice cream, and in many cases a commission on ice cream, which lifts them out of the class of ordinary men, and makes them salesmen. I believe that a consideration of this by the employers present will probably make it worth their while.

Electric Trucks.

There has been a promised demonstration of an electric truck in the city of Seattle for the convention. Whether it will be here or not I do not know. Mr. J. J. Canavan, representing the Walker Electric, has promised that they would have one of the trucks in Seattle for the purpose of making a demonstration. There are some of the trucks now in operation in Los Angeles, and during a recent visit there, I was surprised to find the very low cost of transportation with the aid of these trucks, and recommend to all who are interested in short haul transportation that they consider the electric truck as one of the vital factors in matters of transportation, and should be weighed carefully by those needing new equipment.

Trucks.

Truck weight is to be the basis of license fee and road permit in the future. If recent laws that have

been enacted are a criterian. I urge you to weigh this fully when considering new equipment.

Refrigerating Body.

The refrigerating body is meeting with success in Southern California, and there are some new ideas that are being put out along this line that may be worthy of consiredation. I found one long haul on which they were using the refrigerating body, and it seemed to be giving exceeding good results, and seemed to have a new idea—the pipes being brought out and assembled on the coast. It will be well to have every man here when the speech on the long haul is being considered.

We find that the long haul concerns throughout the country are now abandoning it because they find it too expensive. I found some of the men in California complaining of the excessive cost of long hauls, and others loud in their praise, and will be particularly interested in the paper that is coming here. I ask every man to give special attention to it, so that when we get to the round table session, they can take this matter up in full and go over it carefully.

Weight Legislation.

The papers dealing with the weight question will be brought up, and should be considered very seriously. California has gone through this fight and it has been indeed a scrap. In addition to that, they have had some adverse legislation.

Mr. Dryden from Oakland will handle this question in a paper, and being a past master in the science of milk, he will be able to tell you many things that are surprising, and can be used by your legislative committees in the future. We ask every man to be sure to be present when this paper is read.

Substitute for Milk.

The speaker is particularly anxious to have you bear in mind that there are a number of plans out now to consider the possibility of using substitute oils, and other substitutes in the making of ice cream.

Ice cream has been decreed by the National Government to consist of milk, cream, condensed milk, sugar, flavoring, and unsalted butter and sweet milk when put through a homogenizer. Anything outside of this is NOT ice cream.

We have found it necessary during the past year to call attention to the fact that some of the manufacturers in the northwest were using substitutes and making the ice cream a pudding instead of a cream. It was necessary to do this, and I urge caution. Every manufacturer must realize that the danger of destroying our business is present in every batch of ice cream thus made, and it is well that we urge care, again.

Whenever ice cream is changed into a pudding by substitutes it ceases to be ice cream, and deserves the censure of those men who are engaged in legitimate ice cream making.

I would like to have a record vote of this Association upon this matter and will be glad to have you jot this down in the books, so that you can take this up in due time.

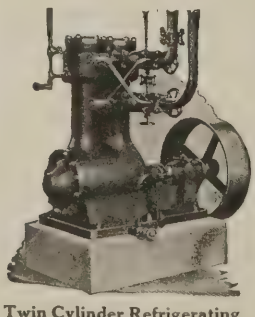
Another matter that I am particularly anxious about is that we should have a record vote on the matter of substitute fat. We must be opposed absolutely and unalterably to the substitute of butterfat in which Soluble A is found. There is no vitamine in any substitute fat that might be used. There is no fat that might be used that can compare in any way with butterfat. Therefore it is needless for me to dwell upon the value of this in the upbuilding of our industry, and I caution you, again, to give this matter serious and earnest consideration. Stand 100 per cent against the use of substitute fats in any dairy product whatsoever.

I believe that it is well for us to discourage as far as possible, and urge legislation against the use of filled milk, or any other substitute, because this is truly an infringement upon the farmer, and the public health and leaves a dangerous way for the intrusion upon our business by the people who are engaged in such manufacture.

Necessity for Constructive Co-Operation.

The necessity for constructive co-operation will be brought before you by several papers, and we urge upon you that you also listen carefully to these papers, giving a history of the quarrel that has broken out between several of the ice cream manufacturers in an adjacent city. We believe that it is well that this matter be weighed carefully and considerable attention and thought be given to this matter.

Dairy Council.



We believe that were there an effective Dairy Council in this locality to step in and assist in the straightening out of the troubles that are bound to exist when a quarrel of this nature is going on, that it would have earned its support in this one instance alone.

Joint Advertising.

The possibility of joint advertising through the aid of a Dairy Council must be evident to every man who is engaged in the business. A campaign of education could be carried on through a Dairy Council that would tell the people of the value of ice cream as a food, could tell the story of ice cream being a food when construct-

CONDENSED AND EVAPORATED MILK MARKE TS SENSITIVE AS HEAVY PRODUCING SEASON APPRO ACHES.

Trading in condensed and evaporated milk markets has continued rather slow, but the general situation appears to show a little healthier condition, although markets are still very sensitive and will likely respond quickly to any depressing factor which might develop. At the low prices which prevailed during February, much of the surplus was cleaned up through European relief and other buying, March 1 total stocks in manufacturers' hands as reported being over 18,800,000 lbs., less than on February 1. The bulk of this heavy reduction occurred in evaporated case goods which made up practically all of the relief orders. The large quantities of goods which have been absorbed for European relief have constituted one of the principal supporting factors during the past few months, and it is the possibility of a much lessened demand from this source which may be regarded as a future influence of importance. It is reported that large quantities of canned milk from New Zealand and Australia have been offered to European buyers at prices which are prohibitive to American manufacturers.

Season of Heavy Milk Production Approaching.

Condenseries have been maintaining a relatively low production through the recent dull months, which has relieved the situation to a considerable extent, and it is felt that if this rate is not increased too rapidly a normal condition will be more quickly attained. On the other hand, however, it appears from the present outlook that should manufacturing on a scale approaching capacity be resumed, the danger of heavy accumulations of stocks would be encountered, because present demand is being well taken care of by current production. The approach of the season of heavy milk production is another factor not being lost sight of, and already in some sections the milk flow has shown quite an increase. Relatively higher cheese prices have diverted to cheese manufacture large quantities of milk ordinarily going into the condensed or evaporated product, numerous condenseries themselves having changed to this product. Fresh cheese prices have held fairly well under quite a good consumptive demand, and have

CONDENSED AND EVAPORATED MILK MARKETS SENSITIVE AS HEAVY PRODUCING SEASON APPROACHES.

(Continued from page 106)

been supported also because of a general shortage of fancy cheese, although cheese markets now are barely steady, and recent price tendencies are downward.

1922 Exports Lighter Than a Year Ago.

February exports were slightly heavier than during January, but for the two months of this year, January and February, there was a falling off as compared with last year of 5,379,000 lbs. of condensed and 8,340,000 lbs. of evaporated, or a combined decrease of over 13,700,000 lbs. Exports of evaporated during February more than doubled condensed goods, and of the 13,600,000 lbs. of evaporated shipped, the export report indicated that approximately half went to those European countries for which relief buying had taken place, principally parts of Russia.

Don't let that used machinery of yours stand in your way. Turn it into cash by advertising it for sale in the "Review" Want Department.

PACIFIC ASSOCIATION OF ICE CREAM MANUFACTURERS.

(Continued from page 102)

ed along a certain line, and a luxury when constructed on others. In other words, if you wanted to show the ice cream which is considered the ideal ice cream by Professor Washburn, his argument could be advanced through the Dairy Council and the people could be educated along these lines, and it could be shown the folly of getting a 20 per cent fat, which is, as Professor Wasburn has oftimes told us, like feeding a furnace in the summer time, and show the value and cooling effect of ice cream with approximately ten per cent fat, or eight per cent fat, as the case may be, because that is a point or argument between many people—the value of solids in ice cream, making it a food instead of a luxury where the high fat is used.

This subject will be covered by the Secretary of the Oregon Dairy Council, who has been the State Dairy and Food Commissioner for the State of Oregon for the past eight years, and his talk upon this subject will be well worth listening to.

National Dairy Congress.

We have a letter from Professor Van Norman, which will be read by the Secretary, setting out the request of the National Dairy Congress for a subscription from our Association of $1,000 membership, and the election of a member to represent us upon the National Dairy Congress. The National Dairy Congress is a show proposed for 1923, and is expected to bring the dairy people from all over the world, to tell us of the advance of science in that particular part of their particular work, and will undoubtedly be worth every penny that is spent for it.

Whether this Association is in favor of spending this $1,000 and a pledge to this effect can be obtained here, or not, is a matter that must be considered by the members.

If it is the desire of the membership that there be a special committee for the purpose of considering this matter, I would like to have a notation made of this so that in due time it can be brought up by the members from the floor. Professor Van Norman's letter will be read by the Secretary in due time.

Winter Business

I would like to have the question of winter business be entered upon your book also, and a most earnest discussion from the floor as to the possibility of increasing ice cream sales through winter consumption. I believe that some effort should be made along this line, and I think that if we could increase the ice cream business so that we would be doing at least fifty per cent of the amount of business that we are doing in the summer time, it would be of tremendous value to us in the business as well as good to the population. I shall be glad to have this matter given special attention and care.

New Invention.

In the general review which I have presented to you, it would scarcely be right for me to close my paper without calling attention to the new inventions which are labor saving devices, and which will pay the expenses of any man to this convention if he will study them well.

The inventions of Mr. Roy Meyers, associated with Mr. George Burt of the Crystal Ice and Storage Co., of Portland, of the brick making machine and the tub packing machine, they are worthy the attention of every member here assembled, and those who have not made their acquaintance should do so. They have been

"Packaged Ice Cream"

FOR many years the approved method of marketing perishable food, such as butter, milk, oysters, crackers, cookies, oatmeal, etc., has been in the original package, prepared and sealed at the factory.

Ice cream in the original packages has not been popular, owing to the expensive, antiquated method of preparing bricks.

The Rogers

Automatic Ice Cream Brick Maker

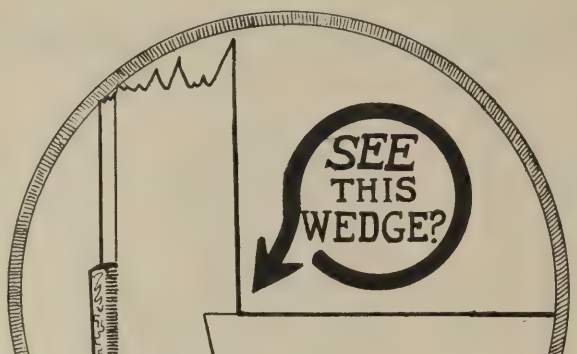
makes feasible and possible the economical preparation of ice cream in bricks in one, two or three colors or flavors.

The boxes, pints or quarts, are fed through the machine automatically. The flavors are put into the boxes evenly and uniformly and the filled boxes are automatically discharged at the other end of the machine.

These cartons go directly into the hardening room. Bricks made in this manner eliminate the undesirable ice shell or ice between the layers which is bound to form by the re-hardening of each layer of ice cream. The quality of the product is therefore improved.

Operating at four gallons per minute, either solid or Neapolitan Bricks are made with less trouble and less expense, by far, than solid bricks could be packed in the old way.

Contrast this simple, sanitary method with the old method of hand-made bricks, using the slab, filling each flavor and hardening, dipping, stripping the slab, cutting, wrapping and cartoning the bricks, and washing and storing the slabs.



The Price of the Brick Maker is $1,500.00

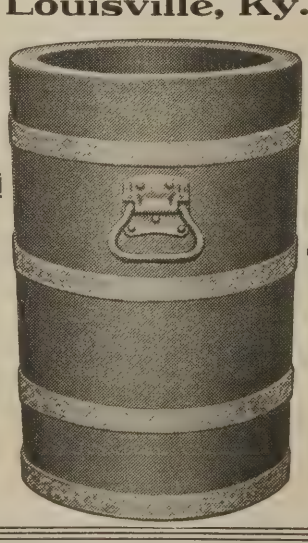
The Greater the Weight Inside, the Tighter the Bottom



The wedge shape construction of our tubs absolutely prevents the bottom being forced out, while the shoulder or offset also keeps the bottom from going in.

Extra heavy and wide galvanized bottom hoop on all tubs of this construction, making them the STRONGEST TUBS ON THE MARKET TODAY.

This bottom construction is on all tubs, 8 to 20 quarts.

Let us fully explain the advantages of our ice cream tubs and cabinets without obligation. Write today!

GAMBRINUS
COOPERAGE WORKS
Louisville, Ky.

Our Ice Cream Cabinets are also Universally known.

The results of Forty-Four Years of Cooperage Experience

a revalation in the manufacture and handling of ice cream in the city of Portland, and I commend their consideration to you most earnestly.

Brick Ice Cream.

To the advertising unit of your business I urge you to package your ice cream in an attractice container that tells the story in picture form. To keep your stock so marked that it may be identified and moved forward to keep it fresh.

In addition, there have been two other ice cream packing machines that have recently been invented and placed upon the market by C. E. Rogers, of Detroit, and Mojonnier Bros., of Chicago. One of the Rogers machines will be demonstrated at the plant of the Seattle Ice Cream Co. during this convention, while a Mojonnier machine can be seen at the Velvet Ice Cream Co.

There have been some other inventions—scientific—particularly the contama tester, which will prove to those of you who are receiving milk, at the end of two hours, whether you are receiving a proper milk or not, and make it possible for you to arrest bad milk and make samples to find the true bacteria count within two hours after receipt of the product. This you can readily appreciate will be of tremendous value to you and should also be considered by every person here.

Another invention is a vending machine, invented by Mr. Weisroth, which will be displayed in the hotel here during the convention.

These are the only inventions that come to my mind at this time, that have reached any degree of prominence this past year, although some new ideas as to the mixing of cream are being considered, and probably will be presented to us here. We shall be glad to hear from those who are acquainted with anything else besides those patents here outlined.

California Convention.

Finally let me ask that this Association send a big delegation to visit with the California Association during its coming convention at Stockton, to show our appreciation for their visits with us and to help a fellow association of which we are proud.

Booze Question.

I wish to say a few words about a condition that has existed during past conventions which I trust will be taken entirely in the spirit in which it is intended. Some of the ladies have come to me and made complaints about the actions of some of those attending our conventions who have been rather indiscreet in the matter of liquid refreshments they have consumed which has been the cause of some ungentlemanly actions and disturbances. In these days of extreme dryness and the sociability that exists when the boys get together it is easy to take on more cargo than the good ship might be rated for in carrying capacity. I earnestly hope that during this and future conventions that such actions will never be repeated.

This is a convention of serious minded business men, and their wives and daughters are our guests. I am confident that no member of this Association would wilfully be discourteous to any of our guests, and the common courtesy due to a lady should at least make a man act as a gentleman.

It has been a great pleasure to serve you during the past year, and I close with a vote of thanks to the Board of Directors, the Secretary, and Field Secretary, and the members who have assisted me in carrying this organization through during the past two strenuous years.

Mr. Dunne: The next will be the report of the Secretary, Mr. Bert Walker.

Report of Secretary Bert H. Walker.

Mr. Walker: This is just a report, it is not an address. Our Association has shown a growth during the past year, especially with the Supply Men, which indicates they are more alive to the benefits of organization than the ice cream manufacturers.

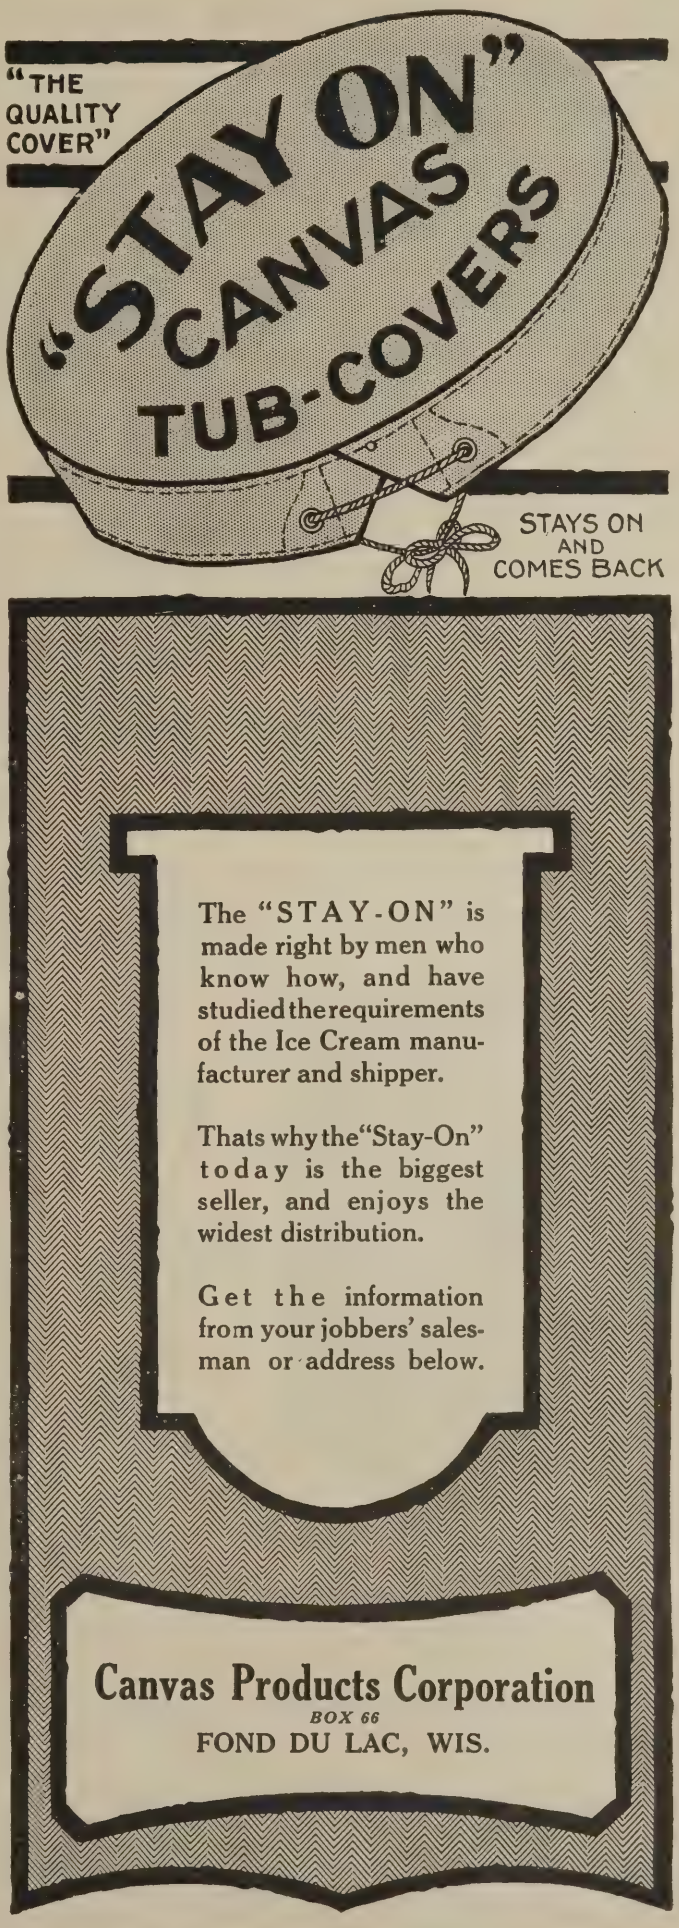
Our present roster shows a membership of 88 active and 84 associate members. There have been two resignations, three have gone out of business. Since the last meeting we have received 15 new applications, making a total membership of 169.

During the past year there has been collected and turned over to the Treasurer the sum of $1,860. There is still a balance amounting to $240 due from members in arrears, any or all of which we will gladly issue receipts for at the desk.

The matter of collecting past due accounts is one problem that confronts the Secretary during the year. While Article VIII, Section 4 of our By-Laws is printed on all statements and is very plain, it is not the wish or intention of this Association to have any member dropped where there is a chance of keeping them with us. Statements have been mailed to the delinquent ones regularly. Even those who have notified us of their intention to resign have been urged to stay in and do their part towards building up the industry. I am glad to say that in most instances this has been the means of holding the members.

We have received a large number of requests for our list of members from different parts of the country, in each instance there has been a personal letter written explaining our position. We cannot send these lists out to other than active and associate members. This has been the means of bringing in a few of the applications we have before us to-day.

From all information available the past season has not been all the ice cream manufacturer could wish for. There are a few instances of increased gallonage over the territory covered by our Association, most of which can be accounted for, but there has been a general decrease attributed to business conditions and a decidedly cool season. This is especially true of the coast section.



The Secretary has been criticised by some manufacturers for sending out a set of letters last summer regarding the use of certain materials in an ice cream mix, which, in the opinion of those in authority, would be contrary to the standards of the U. S. Department of Agriculture, and those adopted by the National Association of Ice Cream Manufacturers. For the benefit of those who may not be familiar with the standards adopted and those classed as adulterations and misbranding, I have had copies printed for distribution at this time. These letters were authorized and subscribed to by your President and were for the best interests of the ice cream industry. Personally, my opinion stands, and I have no apologies to make for my part in it. This is a matter that might well be discussed at the Round Table for the benefit of all concerned.

In closing I wish to thank the officers and members for their assistance during the past year, especially our Field Secretary, Mr. Kugler, whose efforts are largely responsible for the excellent program to be presented. Trusting the coming season will more than make up for the shortcomings of the one just past. (Applause).

Mr. Dunne: You have heard the report of the Secretary. What is your pleasure with regard to it?

Mr. Martin: I move that the report of the Secretary be adopted.

(Said motion was then duly seconded, put to the

convention by the President and carried unanimously, and so ordered).

Mr. Walker: Do you want the new members now?

Mr. Dunne: Yes. They will have to be voted on.

Mr. Walker: The names are as follows: G. H. Ustler, Robert B. Harbison, J. P. Breckel, J. Randall, V. B. Riley, C. B. Terwilliger, E. D. Rogers, C. W. McAllister, C. O. Swanberg, J. J. Lawrence, Ercher & Brott, O. G. Eccles, H. E. Van Patten, M. S. Levy, B. Heller, I. Laverson, Frank Pfluger, C. B. Baker, E. A. Palmeter, J. C. Booth, A. E. Merwin, Frank Sutcliffe, F. H. Harwood, C. A. Britton, H. F. Brace, R. P. Groves, Jas. B. Robbins, E. H. Savage, Albert R. Hay.

Mr. Dunne: What is your pleasure, gentlemen?

Mr. Martin: I move that the names as read by the Secretary be accepted for membership.

(Said motion was duly seconded, put by the President and carried unanimously and so ordered.)

Mr. Dunne: May I hear a motion that the Valley Ice Cream Company be also accepted? If there is no objection they will stand as accepted. We have a lot of telegrams and condolences to be read. The Secretary will now read them.

(The Secretary then read said telegrams and letters).

Mr. Dunne: If there is no objection we will instruct the Secretary to reply to each of these communications and express our sympathy to those that are ill and our appreciation for the good wishes from those who were enforced by other business or moving operations to be absent, and our appreciation for being remembered at this event. I wanted to say that we expected to see Larry Hughes here, but he is in Cuba today spending his honeymoon. Thas will be of interest to a lot of you fellows. They never grow too old to fall, do they?

A New Packing Tub

Built of Douglas Fir, a Pacific Coast shipbuilding timber; selected for its ability to withstand salt water and "stormy" handling.
A dove-tailed, double bottom 2 inches thick; armoured with a 12 gauge, galvanized iron band.
Using the expert knowledge gained from the manufacture of tubs since 1849, the Menasha Tub combines every quality calculated to give it Stamina and Carrying ability.

Menasha Wooden Ware Company
Branch Offices: MENASHA, WIS.
CHICAGO CINCINNATI NEW YORK ST. LOUIS
FOUNDED 1849

How about the report of the Treasurer? Is the Treasurer ready with his report? Mr. A. F. Bird.

The report of Treasurer A. F. Bird showed a balance on hand of $937.84.

Mr. Dunne: The next is the appointment of the committees. I will appoint on the

Auditing Committee—Jack Simonson, S. S. Moore and Mr. Fisher.

Resolutions Committee—Harry Stokes, Will Robb, G. W. Weatherly, D. M. Dorman and Vic Sampsell.

Nominating Committee—F. N. Martin, Guy Herrick, Frank Bird, J. R. Brown and Ira Carter.

Scoring Committee—Frank Hardy, J. P. Brechel and Perl Gregory.

There is a score board which is being submitted here which is the same score board the California Association is using for the proper scoring of ice cream samples, which they used at their conventions, and so a report can be made on that I am going to turn this score over to the Committee and let them make recommendations before the convention adjourns.

The butter and creamery men are holding a convention in this hotel at the same time ours is being held and I wish to introduce to you a member of their association, Mr. Hanson.

Address by Mr. Hanson.

Mr. Hanson: Our convention is going on at the same time the ice cream men's convention is running and we deemed it advisable to hold a joint session in an effort to get together, as you might say.

Our association of buttermakers and creamery and cheese men—I do not know how to explain it—but we kind of died in our tracks, but through the good offices of President Dunne and Secretary Walker, we have decided to dig ourselves out and we thought we would come in and join the ranks of the ice cream men.

We wish to develop the association of creamery men, butter men and cheese men to a point where we can have everybody realize that we are doing something, and we have some wonderful men in the field. We have been living in our shells so long that it may be hard for us to come out and get busy and we do not know what to do unless we tie up with somebody that is taking an active lead and if there are any of you people who are butter men and cheese men, if you get tired at the proceedings here—which I do not believe you will—we should be glad to have you come over and listen to our session once in a while. Thank you.

* * *

Mr. Dunne: At 8:00 tonight, between 8:00 and 8:30, our friends will call at the hotel to take us to the Yacht Club, and I am requested to ask all local people to bring their machines here as near 8:00 as possible.

I am also requested to announce that there will be a luncheon for the ladies tomorrow at Frederick & Nelson's at 12:30, at noon. They will meet at the waiting room on the fifth floor of Frederick & Nelson's and you will please wear your badges so they will be able to identify you.

The next number is "The Value of Organization and How It Functions," by W. H. Paulhamus. We have a wire here which says that he will endeavor to be with us today, but it is doubtful. We will pass his subject and he will probably be here tomorrow.

As Mr. Fernald is not in the room, I will now call upon Mrs. Nettie May Miller, who will address you on the subject of "A Talk by a Silent Partner." Mrs. Miller comes from Oakland, California, and I tell you she is a live wire, and while she may call herself the

silent partner, you will find her a most active partner in the success of her husband's business, and I now take pleasure in introducing to you Mrs. Miller.

"SHALL THE 'SILENT PARTNER' KEEP SILENCE?"

Address of Mrs. F. Ellis Miller, before Pacific Coast Ice Cream Manufacturers' Convention, Seattle, November 15th, 1921.

While it may be somewhat unusual for a woman to address a convention of commercial men, the time has passed when an apology is expected for her so doing. For more than half a century we have demanded equal rights with men and it would ill become us to expect special privileges, or special relief from any of the duties which "equal rights," so far as we have them, have imposed on us.

MRS. F. E. MILLER.

So that I may launch my remarks free from any doubt, I will say that I am the near-silent partner of an ice cream manufacturer, that I realize I must share with him the responsibilities of business, and that I do this without in any way neglecting or shirking the duties of a home-maker.

To those who still cling to the idea that a woman should not become active in her husband's business because it takes time from the home, may I call your attention to the fact that the housewife today has not one-fourth of the work to do in her home that was the lot of the women of a generation ago. The marvelous improvements that the brains of men and women have evolved in the last twenty-five years have relieved the woman of this day of so much manual labor that she has ample time to use her intellect. If all these improvements have not aided the advance of women then many of the world's greatest workers and thinkers shall have worked and thought in vain, and we know that they have not.

The best thing God ever made was man. After him came woman, and she has been after him ever since. It is said she has overtaken him in common and uncommon vocations. She has invaded every known profession, art, trade and vocation in the world except two. There are women lawyers, politicians, policemen, preachers, blacksmiths, but she is not yet a military field officer, nor a telegraph lineman. I do not think I would care to shoe a horse or arrest a burglar.

But to the men of this convention who think they have built their business on their own ideas, I want to say that one of our deep thinkers says that there is no such thing as a self-made man,—there is always a woman in the case. Are we less feminine because we become interested in things outside the home? Indeed we are not. If we women ever edit our own magazine you may be sure we will not forget a place for fashions and cooking recipes. We women were all interested in Mme. Curie's little black gown she wore when she came to America—the discoverer of radium—but we also fully appreciated the significance of that gram of radium.

No longer is there any reason to keep man's silent partner silent. Ultimately she will be heard. You perhaps have heard the story of two men who were sitting in an office when suddenly they heard a loud report in the adjoining room. One jumped up and said to the other, "Oh, what was that?" The other replied, "Oh, don't be alarmed, for that was only my silent partner in my private office." That my conception of this silent partner relationship is right I will quote a few sentences from the current number of a popular magazine. The article I refer to tells how western women have a way of their own in getting results. So says this clever writer:

"Out in the West the men and the women are talking and working and the children are learning about these things that mean the very life of their families and the families of the future. And because they are common interests there is a wonderful unity of purpose—more than there is perhaps in any other section of the country—among the plain, average citizens. Sex antagonism is unknown. The story of how the western women educated the canners is almost romantic. 'Until the women organized and came to us with some very definite suggestions,' the vice-president of the National Canners' Association said, 'we got our inspiration from the jobbers. We never knew, and somehow we had not thought of trying to find out, what the consumer really wanted. Now we can plan intelligently to the ultimate advantage of both manufacturer and consumer. Hereafter the wishes of the housewife will be consulted and we will endeavor to supply what she demands.'

"It was about ten years ago that the women of the West began to wake up. They took up their prejudices against manufactured canned goods one by one and looked at them in the clear light of reason. They decided to do a little thinking on their own account. They took the advertised brands and gave them a fair trial. They made up their minds that quality, purity, and wholesomeness were the first considerations. Where a brand of goods measured up to their standard it went on the household white list.

"So persistently did the women pry into things that manufacturers began to turn their factories inside out and show their hands. If their goods measured up they began to let it be known through advertising, and if they didn't, it was up to them to make them measure up. Women wanted to see how the wheels go round, and before long they were able to read in their papers and magazines, advertisements about such commonplace things as piston-rings, and zinc, and paper bags. There was 'nothing hidden that was not revealed.' The net result was a survival of the fittest, for the poorly made goods could not stand the searchlight. It is amusing to hear the canners admit that 'the little ladies of the West have educated them.'

"City women, pity your sisters on the far-away farms and ranches if you will, but the women in the

Notice The Corner Posts

The mortised corner-post construction of the Brooks Ice Cream Cabinet results in durability and the saving of ice. The Brooks is strong, tight, economical and satisfactory because it is built that way.

Strength and Economy Are Leading Features

All materials, of every kind, are of standard grade thus insuring long life by preventing a break-down in any one part. Brooks Cabinets have special features which are not to be found in any other cabinet.

— Write for the New 1922 Catalog —

We manufacture Tub, Metal Lined, Brick and Combination Cabinets in different sizes, and will be glad to mail you our 1922 Catalog which shows the new models and gives full descriptions and prices. Stock models always on hand. Special orders shipped quickly.

Our new Catalog will tell you how Brooks Ice Cream Cabinets are made and give you detailed information. Read it and you will be convinced that the Brooks will stand the most wear, use the least ice and keep the ice cream in perfect condition. They're guaranteed.

EVER HEAR OF ICE COLD CAKES SELLING LIKE HOT CAKES?

West are the most progressive, the most resourceful, the busiest, and the happiest women I have ever met."

Now, having placed woman in her rightful place in the home and business it only remains to bring home to this convention how these same conditions, through the medium of an ice cream manufacturer's wife, can be applied with benefit to her husband's business. We have touched on what we may call generalities; let us be specific.

First. Team Work. So far as may be, take an intelligent, not merely a superficial, interest in your husband's affairs. The country's greatest captains of industry long since discovered that many mishaps were caused by men in responsible posts whose minds were torn asunder by domestic friction. We know that to be true. Harmony is just as vital to the success of the ice cream man. His mind is preoccupied with the study of how to improve his product, which means the improvement of business. He comes home with problems relating to every detail of his business, including perhaps some that press heavily upon him. He needs encouragement maybe, he appears to think that the whole world is made of ice cream and that upon his shoulders rests the sole responsibility of maintaining it in proper condition, and of marketing it. Here's where the value of the 'silent partner' comes in. She knows enough about his business to assure him that the rough places can be smoothed out, that everything is all right, and can prove it to him. At such a time, team work is the equivalent of all the capital tied up in the business.

Second. Entertaining and Co-operation. In the get-together meetings which should be held once a month if the manufacturer wants a smooth-working organization, he should be on hand to greet and counsel with the men. Their wives and sweethearts should also be invited to this monthly gathering of business and entertainment, and the employer's wife should have a program all her own for the women folks. If there be dancing let it be strictly democratic and don't fear that you may have to struggle with a poor partner, for, truth to tell, most of our employees are much better trippers of the light fantastic than my husband or myself. Under such circumstances as these the 'silent partner' can make herself heard with telling effect. The wives of your employees should be doing exactly the same kind of team-work with their husbands that I am now advocating for the 'silent partners' of the employers.

Third. The 'silent partner' can be of pronounced value to the firm by carefully studying all the magazines, literature, trade journals and advertising pertaining to the ice cream business. The manufacturer himself has time only for cursory reading of such matter. Yet they contain much of value to him. His wife can tell all the good things relating to the business and give him the full benefit of her work. She will often adapt valuable suggestions to local conditions and thus give a direct impetus to business.

Now, when you stop and think of it, is it not logical that the 'silent partner' should help sell, or bring ice cream before the public? Few lines of business offer a greater field for women to enter than the ice cream field. A close survey of neighborhoods has shown that a large part of the sales are to the housewife; three-fourths of orders over the telephone are given in a woman's voice. It is the mother who gives the child money to go to the neighborhood store to buy ice cream. The ice cream firm should make its advertising appeal to the housewife and mother who is the purchasing agent for the family. These facts give the wife, or your 'silent partner' keener insight into ways to increase sales and promote business.

In conclusion, let me say with all reserve and delicacy, that the fact that I have come eight hundred miles to attend this convention and speak to you on a matter more or less practical and interesting to all, is perhaps the best demonstration I can offer of my conception of the "silent partner" working in harmony with the rest of the firm.

"If with pleasure you are viewing any work a woman's doing
And you like her and you trust her, tell her now.
Don't withhold you approbation till the parson makes oration
And she lies with snowy lilies o'er her brow.

For no matter how you shout it, she won't really care about it,
She won't know how many teardrops you have shed;
And if you think some praise is due her, now's the time to slip it to her,
For she cannot read her tombstone when she's dead."

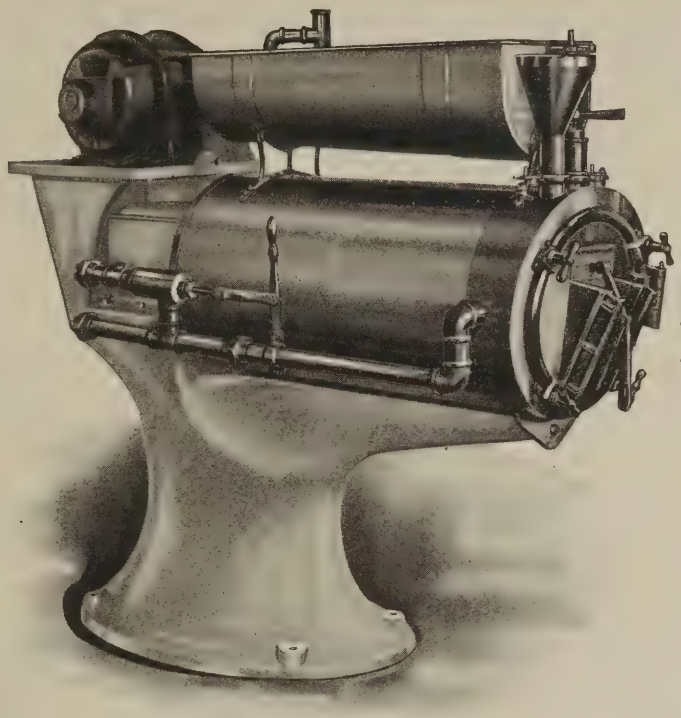
* * *

Mr. Dunne: I will say she is some silent partner. (Applause and laughter).

I see Mr. Swanberg clapping his hands and I think he knows that no man really lives until after he is married. That is what I have been telling Mr. MacFarland, but he will not believe it. When the little fellow come along and brighten the home and the lives of yourself and wife, if your wife can still be a silent partner and help you, it is certainly a fine thing.

The next address will be by Mr. A. R. Fernald, whose subject is "Broad-Minded Advertising." Mr. Fernald has been good enough to come all the way from Detroit to tell us his idea on broad-minded advertising. I now present to you Mr. Fernald. (Applause).

Address by Mr. A. R. Fernald.*



Mr. Fernald: Mr. President and Ladies and Gentlemen of the Convention: I want to begin by telling you an advertising story which I think you can apply to your own problems here today and it had to do with an advertising man who had occasion to attend to an account out in the upper part of the state and when he arrived there he found that he was obliged to stay over night and in the morning he got up and went into the bright, sunshiny, well-ventilated dining room where he was waited upon by a very attractive girl in spotless gown, and he picked up the menu and looked at it and among the items on the menu was "Rabbit sausage." He turned to the girl and he said, "Rabbit sausage. I do not believe I ever heard of it before. Is it good?" She said, "We serve a great deal of it and have served it for some time." And he said, "Well, I will try it anyway."

The girl brought it in hot from the fire, brown and sizzling; it was a crisp morning, giving an appetite, and she brought in the sausage and laid it on the table and he fell to, and it was great.

With the imagination and vision that are necessary in the calling of an advertising man, he began to build a few air castles all his own. He thought of Jones dairy sausage made in Wisconsin in a small town which has since gained a national reputation and he thought of these things, and the idea struck him what a wonderful article for national advertising—almost as good as ice cream—and he began to think of advertisements that could be prepared for such a product. He thought of little bunnies running up and down the margin of his copy and all that sort of thing, and after breakfast he said to the proprietor, "I noticed this rabbit sausage on the menu and I tried it out and it was fine and I would like to know where it is manufactured?"

The proprietor of the hotel told him that it was made down at Pleasant Hill, about a mile from the little town

*A summary of this address was published in the January issue.

Added Fine Features Make The Emery Thompson

Freeze Faster—Develops a fuller yield.

Lasts Longer, with harder usage.

Handled with greater ease.

Stouter in general construction—with less parts. Is far more economical.

Is more flexible, more quiet and is better balanced for finer Ice Cream production, than any of the machines we have turned out in the past many years of ice cream freezer manufacturing.

271-75 Rider Avenue (6-8 Canal Place) **BRONX, NEW YORK**

ICELESS CONTAINERS HAVE PROVED TO BE A GREAT ICE SAVER.

and the advertising man took a walk over there and found the sausage manufacturer merrily whistling and turning out his product.

While he was talking to this man he was interrupted by a man arriving, driving a very disreputable looking horse and the proprietor of the sausage factory went over and talked to the new-comer and they had some whispered conversation, money changed hands, and a few minutes later he saw the man leaving by a side path with the harness over his arm.

The advertising man, not being entirely dumb, began to press the sausage proprietor and he said to him, "By the way, I would like to ask a question. Do you use any other ingredients in your sausage besides rabbits?" And he said, "Sure," And he said, "What do you use?" And he answered, "We use a variety of things."

Then the advertising man said, "I do not mean to be personal, but I will ask you a rather pointed question. Do you use horse meat?" And he said, "Sure," and the advertising man said, "How much do you use?" And he replied, "Oh, about fifty-fifty; one horse to one rabbit." (Applause).

Now, I think that you gentlemen in the ice cream business, if there is any criticism of your business methods to be made, I think that you have got the horse and rabbit ratio mixed up in your advertising. In your advertising at the present time you probably have about ninety per cent material and about ten per cent plans, and I tell you frankly those proportions are not right.

Now, I have seven points to bring to your attention today. I am afraid that Mr. ———— will think I have been reading his mail, but his points and mine make fourteen points and that has gone down in history (laughter) and therefore his points and mine together should make a success.

My seven points are as follows:

The first one is Lack of Order in Fixing Appropriations.

The average advertising appropriation is not an appropriation at all but rather consists of sums of money wrenched from the business at irregular intervals dependent very often on the whim of the owner or owners rather than an analysis of the need.

Oddly enough it is also true that this money is usually easiest to get when business is good and the advertising is least needed. Such a program makes a PLAN of expenditure impossible, promotes waste and brings about hurried decisions resulting in many errors of judgment.

My second point is Lack of Continuity in Plan and Materials.

The "catch as catch can" method of appropriation results not only in a lack of plan but also in a lack of continuity in the materials or advertising text used to carry out a campaign.

Miscellaneous material is purchased, expenditures are made in things that have no general connection with your campaign.

Under these circumstances it is rarely possible to get full value from the yearly expenditures.

My third point is Lack of Regularity in Plan and Use.

Perhaps the greatest drawback in irregularity of plan is the fact that your advertising is almost always intermittent. Instead of the long pull, the secret of most successful advertising, you advertise jerkily. Your heaviest expenditure invariable falls in the summer season and the fall and winter season, when gallonage is most needed, is neglected and has no opportunity for development.

My fourth point is Neglect of Opportunities Offered in Use of Properly Prepared Mailing List.

It is only in the past year or two that some of you have been awakened to the fact that your most fertile field for advertising lies in intensive mailing lists in which groups of consumers can be influenced to regard your product most favorably and, through reminders, educate to use it more frequently than has been their custom. The advantage of being able to direct an advertising force to concentrate on one group or section is so obvious that it requires no defense. I have personally studied and practiced the principles of direct advertising for the past fifteen years and am thoroughly solid on it both because of its flexibility, the privacy of the method, and the fact that you can actually check the results. Now the first question you are apt to raise is: "Will it work in the ice cream business?" I am here to say that it will and does. To the end that I could bring you proof of this in connection with the development of winter gallonage I sent out telegrams about two weeks ago to makers who were using direct advertising methods in cities varying in size from the second largest in the country to towns of twenty-five, fifty and one hundred thousand population.

Here are a few samples of their replies:

"We think the direct by mail plan of advertising ice cream in the winter months is one of the best methods of stimulating business for this season of the year."

"Regarding winter mail campaigns used last winter. Well pleased with results. Many requests for additional copies from friends of those to whom campaigns was mailed. Believe campaign creates interest during winter months and holds business up where ordinarily drops off. Well worth cost. We stand back of our belief by re-ordering."

"Mail campaign is winner, one of strongest connecting links possible in advertising and sale of ice cream. Results entirely satisfactory."

"Consider direct method best means influencing housewife to use ice cream in home. Well pleased and will continue this year."

"Without a doubt best medium to reach housewife. Wonderful results last season. Increased fully 50 per cent and will use again this season. Certain of results."

"Have used campaign and would advise any one interested to get busy on mail plans. Figure have increased our business 100 per cent."

I am not quoting these as a boost for our own business but to bring forcefully to your attention a heretofore neglected field of ice cream advertising that holds vision and forethought to use it.

My fifth point is Waste in Distribution of Advertising Matter.

A great deal has been said about waste on advertising materials, and no doubt much of what has been said is true.

After all, if you will regard the matter reasonably, have you ever considered that this is largely your own fault?

These abuses have been brought about by your own carelessness and neglect and you are reaping a perfectly material result. If you have no plan for distribution, you can depend upon it there will always be waste and plenty of it.

Another point I want to consider is the fact that there are certain limits to the life of any piece of advertising display material and you are perhaps expecting too much in the way of continuous display from it. Suppose I were to pay eight or nine thousand dollars for a single page of advertisement in a certain popular weekly magazine. Would I expect every one who secured a copy to carry it about in their coat pocket

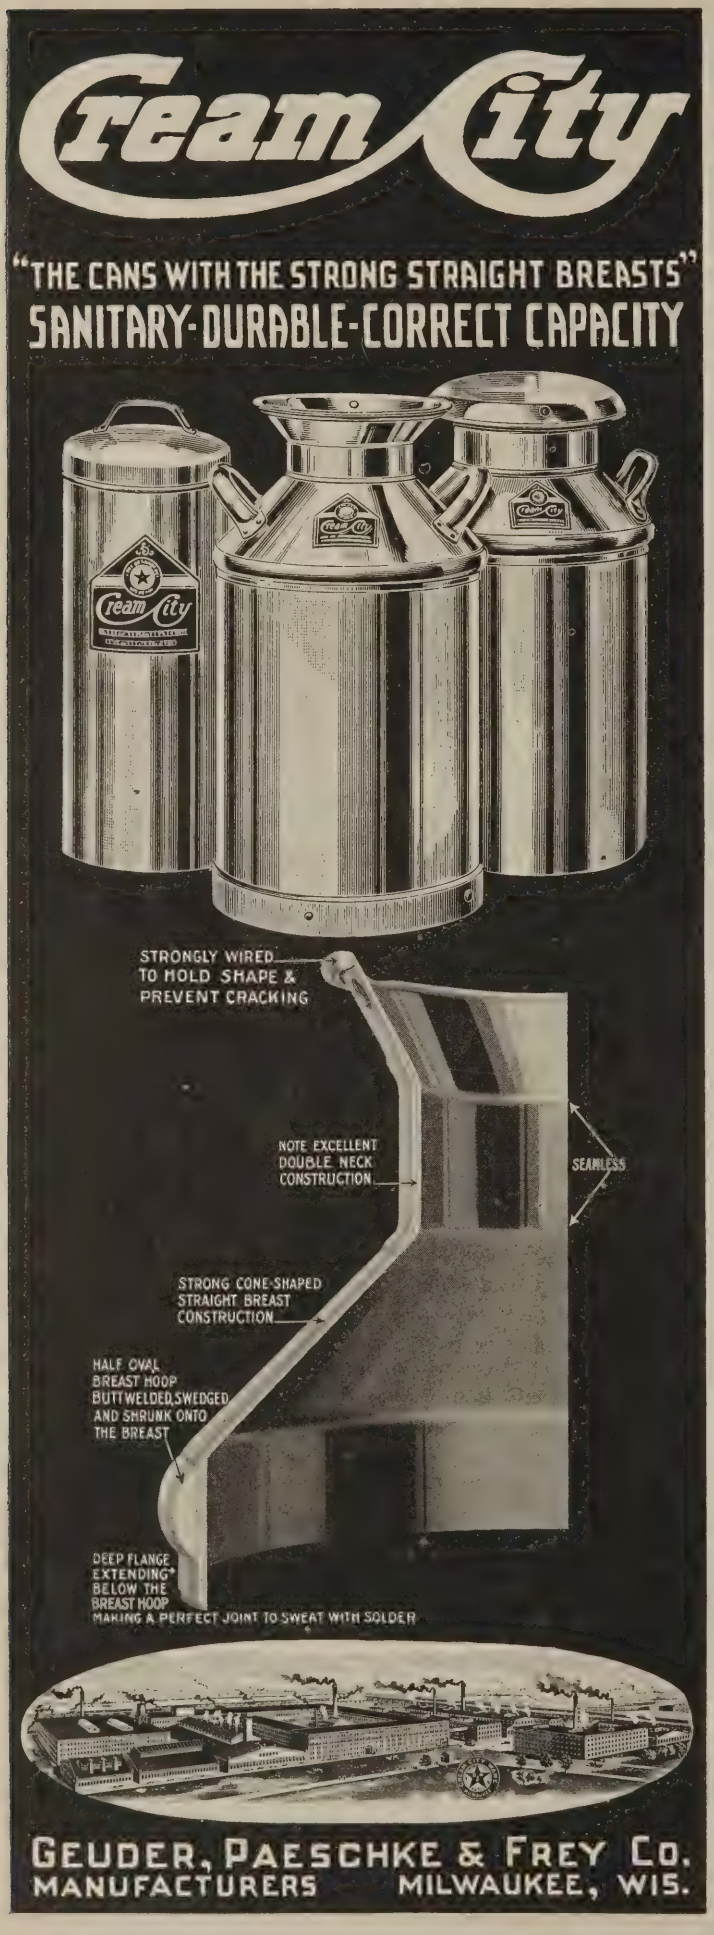
RETINNING ICE CREAM CANS

Special Department

WE DO REFINISHING of old ice cream cans in a special department of our plant which devotes its entire time throughout the year to doing this one thing and doing it well.

OLD CANS MADE NEW AT LOW COST

And we do know how to fix up your otherwise hopelessly rusty old cans so they will be tight and bright and good as new. IT IS NOT EXPENSIVE and PAYS YOU A DIVIDEND. A can retinned by us has a thicker coat of Pure Block Tin than when new.



SAMPLE CAN RETINNED FREE

This is the time of year to send cans for renewal. Send us a sample can NOW. We will repair and retin it without charge and return it promptly, so you can see the quality of our work. Write us when you ship it, so we will know whose it is, and we will do the rest.

OAKES & BURGER COMPANY

Established 1873 CATTARAUGUS, N. Y.

A GOOD CABINET AT A GOOD "STOP" IS A GOOD INVESTMENT.

month after month simply because my advertisement was in it? I couldn't expect that.

My sixth point is Lack of Interest in Developing Dealers.

I believe too little interest is taken in the development of your present dealers. You cannot extend this interest if you know the dealer only as a name. If I were an ice cream manufacturer I should have a complete record of my customers as a part of my permanent files. I would know how many had fountains, those that were open to that development; the extent of their bulk or carrying trade; what advertising was suited to the individual dealer and all of the things that would give me a clear office picture of my field.

Most of the largest operators have the information, but you should ALL have it summed up in a clear logical manner, and it is just as important for the smaller operator whose business is to grow as it is for the larger ones.

My last point is Lack of Interest on the Part of Your Wholesale Men:

I do not know just how much you expect from your wholesale men, but I do know that if it were my business and my wholesale man was not a man with a vision of the possibilities of the business, I should fire him and get a new one.

On the other hand, I think that lack of development on the part of the wholesale man is often the fault of an employer who lacks vision himself.

I have seen some fine material in wholesale men whose lack of development rested entirely on either the lack of energy or enthusiasm on the part of the employer himself.

Another point — see that your wholesale man not only understands your advertising plan, but that he is thoroughly sold on it himself. Make him a part of it because it is one of the things he has to sell and his enthusiasm and belief in it will contribute largely to its success and economical use.

Now, let us check these one at a time, take them apart and examine them and seen whether they are curable and if you agree that they are, let's go ahead and cure them.

Now let us substitute seven new cardinal points for constructive building to influence our new policy.

I should say that to be successful in your advertising and sales effort you should

First: Fix the appropriation in relation to your gross business.

Second: Lay out a definite plan.

Third: Make a simple office analysis of your dealer's situation.

Fourth: Make an accurate study of your competitor's field.

Fifth: Educate your wholesale man to merchandising possibilities.

Sixth: Compile strong mailing lists, for mail helps.

Seventh: Properly select and distribute your advertising material.

Taking into consideration the first point, Fixing the Appropriation in Relation to your Gross Business:

Out of the millions of dollars that are being spent annually to advertise the ice cream business there are bound to come definite figures as to the proper amount that should be invested by you to assure a continuance of your present trade. As well as developing new markets.

There are occasional conditions that either raise or lower the volume of expenditure, such as chronically good or bad seasons, the absence or the presence of spirited competition and these must of course be dealt with individually, just as one would deal separately

with a business that was new and that might as a result expect to double its gallonage each year for the first few years until it had established its field.

In the main it is safe to base the ice cream manufacturer's appropriation on three to five per cent of the gross turnover.

Second. Laying out a definite plan:

Having determined the appropriation it is now up to you to give thought to a plan that will give you the best showing possible for the money expended.

Perhaps the most important part of such a plan is to see that your expenditures are so proportioned that you will be spending the proper proportion of your money in the months or seasons when the advertising is most needed. Do not have any lean months, for you will find almost invariably that they will have an exasperating way of bobbing up just when you have need of added effort.

The next point about your plan is to lay it out with a definiteness of purpose.

Know what you are going to say and say it steadily through the year. Associate some definite phrase to your advertising and have it a good one for the public, through your continued advertising is bound eventually to believe and recognize it. Adopt a style for your advertising. Have your advertising, your shipping packages, your stationery, follow this style without a break. That is why great care and thought should be given to the organization of your style, because you are adopting it not for a season but for the life of your business and you can afford to have it the best.

Every point of contact you have with your customers and with the public should express your individuality. Having selected a plan and being satisfied with the wisdom of your selection, do not depart from it.

Souvenir programs, novelties, special editions of newspapers and all their kindred are too often the "catch all" that greatly adds to your advertising cost without adding proportionately to your volume.

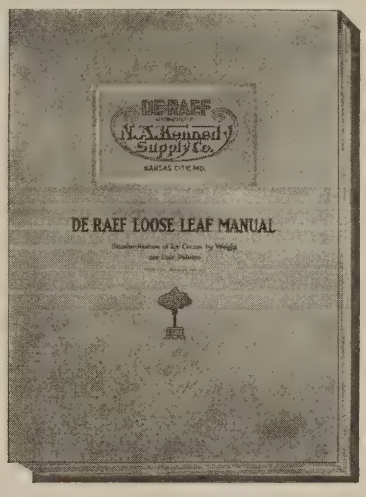
Third: Making a Simple Office Analysis of Your Dealer Situation.

As I pointed out to you it is important that this should not be merely a matter of knowledge on your part, but a matter of record, for it is only by putting it down in black and white with an accurate accounting of probable needs that the possibility of expansion and development can be gauged with any degree of accuracy. It is important too that this list be cultivated by mail as well as through salesman contact.

Fourth: An Accurate Study of Competitive Fields.

While no doubt every manufacturer has a broad general idea of their competitive field again very little effort is made to get an accurate picture record of the extent of this field, where it can be wisely and economically cultivated, and the economic limits of shipping and service. This should be painstakingly done in every growing business.

Fifth: Educating Wholesale Men to Merchandising Possibilities.



No wholesale man should work without a definite plan of increase based not on haphazard solicitation, but on STUDIED solicitation that will give the best return for time expended.

His interest in your advertising should go beyond the mere delivery of display material to the dealer and he can save you hundreds of dollars in educating the dealer to make such use of it as will make it mutually profitable. The right sort of a house organ mailed each month to the dealers will help keep up interest between calls and aid him in the contact work.

Sixth: Formation of Strong Mailing Lists.

As you grow to use direct advertising methods, the

GOOD TIN FOIL MAKES THE COATED ICE CREAM BAR DISTINCTIVE AND ATTRACTIVE.

success of your plan will be measured largely by the proper selection of names for your mailing list.

To create trade and prestige for your dealers you must reach two classes and a name must either fall within one class or the other to be useful to you. The first class consists of people who are themselves consumers of cream to a fair amount and thus open to cultivation and development. The other class are those who through contact with a large number of other people are able to do you a great deal of good in unconscious "word of mouth" advertising. Thus a good mailing list would contain the names of the officers of all clube and lodges, school teachers, ministers and priests, doctors who would be interested in the purity of your product, domestic science instructors, trained nurses—all of whom are people who have contact with many others and whose good opinion counts in moulding your local reputation.

In securing the names of consumers — blue books, social directories, membership lists of the better clubs, and home addresses of women secured through co-operation with those dealers whom you wish especially to build up, are your best sources. The wives of members of Rotary, Kiwanis and other business lunch clubs form excellent lists, and you have the added opportunity of distributing an initial price of advertising at lunch to start the ball rolling.

Seventh: Proper Selection and Distribution of Advertising Material.

In selecting the material for your plan proper card records on dealers will give you an accurate guide as to the quantity required. There is no need to supply a five dollar window display to a store handling bulk and cones only. Window display in the larger stores should, wherever possible, be put up by your own people, and hanging cards or counter signs either cleaned or changed frequently enough to keep them fresh and attractive.

The materials you select should show continuity. Avoid pretty pictures that are general in character and too often distract attention from your product instead of attracting attention to it.

Use color wherever it is possible and let your illustrations run largely to reproductions of the cream itself, attractively served, delicious and inviting and occupying the foreground of the picture to the exclusion of everything else. Backgrounds should be unobtrusive and in softer tones carrying out just enough detail to give an atmosphere of class and quality.

We put new life in old cans by our

DALLAS TIN PLATE CO. 2836 N. Haskel Ave. DALLAS, TEXAS

Sidewalk signs, where they are allowed by city ordinance are good.

Billboards are used too often in cases where they do little if any definite good, but they appeal to the vanity of the user who likes to see his name in big print, conthing that may be said to the contrary, the fact remains sequently they are bound to be used. In spite of anythat people have not yet been taught to ask for ice cream by brand, and ice cream is seldom asked for by brand. The best place for advertising display is outside the store, in windows and on walls and counters. Here the display of your signs inform the public that your cream is on sale and, prompted by the reputation for quality you have created, people feel free to purchase because they are on the spot and it is convenient for them to do so.

To jog their memory outside the store and cause them to go from store to store seeking your goods and refusing all others is quite a different matter. That is why direct mailing lists should be built up in sections and neighborhoods where you are prepared to supply the demand and where your co-ordinated advertising completes the circle and through continuity of expression rounds out the sale.

Before closing I want to touch on two or three other points that are important. First. quality of product. That is your best advertisement. Neither I nor any other advertising man can offer you anything better, and it is a fact that no advertising, no matter how clever, can continue year after year to sell an inferior product. Advertising will bring people to a trade but it will not hold them if the product does not satisfy and please them. No one can afford the drain of continually advertising to a new audience. If your advertising is to be financially profitable your product must hold the trade you gain and make new friends in the bargain.

Another point is that of giving your business a personality, for there is personality in business just as there is in the individual. A man without personality is handicapped and a business without personality is hampered in growth because it takes people longer to hear of it and is less deserving of public interest.

Last and most important of all—get the confidence and respect of your community. Never break that confidence through poor goods, sly dealing, or unfair methods, and don't quarrel among yourselves.

Good clean competition based on the right rules of business and friendship will make business for all concerned because in reaching out for more business, you automatically create new business from the public far in excess of the old business you take from a competitor.

"Knifink" competition on the other hand causes you to give your property to the dealer, necessitates advertising expenditures beyond the bounds of good sense, and makes you easy prey for any one who cares to play the one against the other to the detriment of both.

You on the coast have fewer heritage in the way of old time methods, old plants, and old prejudices. You're off to a fresh start and can be bold as you will in a business that is growing as rapidly as any good business in America.

Steer straight, have a plan and keep faith with the public by giving them a full measure of value and you will find not only financial demand but the satisfaction of growth through service which after all must be at the root of every permanently successful business. (Applause).

Mr. Dunne: I want to know if anyone present wishes to ask Mr. Fernald any questions?

Mr. Fisher: I would like to ask why Mr. Fernald opposes billboards. I believe he stated that they satis-

FLAVOR YOUR ICE CREAM WITH

Cremilla

"CREMILLA" is better, smoother, creamier and of richer flavor than the finest grade of pure vanilla; and it's more economical.

"CREMILLA" is so concentrated as to make it the best flavor to use with homogenized cream; one-third to one-half oz. flavors perfectly 10 gallons of cream (one to one and a half pints for 500 gallons.)

Trial gallon by express on request. After fair trial, if you don't like it, send back what's left and pay us nothing.

ICE CREAM SANDWICH MACHINES ARE POPULAR ATTRACTIONS AT PARTIES, BAZAARS, ETC.

fied the users by appealing to their vanity in seeing their names in big letters.

Mr. Fernald: I will tell you my reason for making that statement which is this, that people certainly as far as I have met them, have not yet become accustomed to asking for ice cream by brand. The difference between attracting a man after he is in the store or attracting a woman after she is in the store and attracting them through the fact that the thing is on sale there are two entirely different propositions and I think the most important is to advise them of the fact that they can buy it conveniently near, making it easy for them to find it. But, on the other hand, I have yet to see many cases where people will, through impulse that might have been gotten by a billboard appeal, go shopping from store to store asking for a certain brand of ice cream and refusing all others.

I think that is the situation as I see it. It is the situation with your direct advertising. Your list should be selected in the neighborhood where you are prepared to meet the demand because the public are not educated to asking for ice cream by brand. I believe that is 90 per cent right.

Mr. Dunne: Any other questions?

Mr. Bland: I would like to know what your idea is of advertising in the movies or by slides?

Mr. Fernald: I would say the same general situation would apply to movie advertising. I think the appeal can be gotten across on a screen pretty well on account of the person who is attending the theater, there is a possibility that he is out for entertainment and they regard ice cream as entertainment, and I believe you have got a better opportunity there. I think the mind of the theater-goer is more open and susceptible to your approach. I think that would be true, and I think, too, it would be a useful thing in putting across something if you have some special thing to introduce, but the great trouble is that you do not advertise special things, but that the advertising is to often in generalities.

Mr. Dunne: Was there anybody present who wished to ask Mrs. Miller any questions? I let her talk go by without asking if anyone had any questions. I heard one fellow say that he wondered how Mr. Miller keeps his wife being such a good partner. Does anybody want to ask him how he manages it?

Mr. Dreyer: I want to ask Mrs. Miller to give my wife that recipe.

Mrs. Miller: I have been trying for some time to educate Mr. Dreyer's wife and I think it is at my instigation that he went into business in my city.

Mr. Swanberg: When I started in business in San Francisco I had a wife who was something like Mrs. Miller, but I took in a partner and my partner resented my wife acting as such a silent partner, but having heard Mrs. Miller today I wish I had parted from the other partner and taken in my wife. (Applause and laughter).

Mr. D. A. Dorman: It has been suggested by one of the ladies that maybe one of the reasons Mrs. Miller has been of so much assistance is that her husband comes home at night. (Laughter).

Mr. Dunne: I think probably that was my wife. (Laughter).

Mr. Dorman: And that her husband comes home at night and tells his wife his business.

Mrs. Miller: I would like to know if there is any ice cream man who ever comes home late at night. (Laughter).

Mr. F. N. Martin: Mr. Dorman is not married and does not have to come home.

Mr. Dunne: I am sure that after Mr. Dorman has heard what these gentlemen have said he will go back home and find a partner.

Mr. Dorman: I am going to look around here. (Laughter).

Mr. Dunne: He says that Larry Hughes will not have anything on him. The next address is by George Burt, but he came back too late to prepare his paper for reading at this time but it will be given to you before the convention is over. I can go on and call some other member or do you want to adjourn now.

Mr. Swanberg: I am the oldest man in the room and I feel very fresh. Let us go ahead.

Mr. Dunne: I will ask if Harry Stokes will come forward with his paper, as we have received word that Mr. Paulhamus is not here and I think that Mr. Stokes will deliver his address at this time. It is hardly necessary to introduce Harry Stokes to you as you all know him. I want to say that Harry is one of the pioneer ice cream people in the city of Seattle. When I first came to Seattle everybody knew Harry Stokes and his name was written all over the city. He is president of the Stokes Ice Cream Co., and his address will be on "Creating New Business."

BUCKINGHAM JOINS THE MUNN-NICHOLS ADVERTISING AGENCY.

Mr. Daniel J. Buckingham, who for some years past has been advertising manager of the Manning Manufacturing Company, Rutland, Vermont, has severed his connections with that concern to join the forces of the Munn-Nichols Advertising Agency, Bookstore Building, Springfield, Mass., as a partner of this concern. Mr. Buckingham intends to specialize in dairy advertising and he will have charge of the Dairy Advertising Department of this concern. Mr. Buckingham is qualified to give superior service to manufacturers in the dairy field.

CEDAR RAPIDS PLANT DESTROYED BY FIRE.

The Cedar Rapids Tinning and Galvanizing Company of Cedar Rapids, Ia., recently suffered the loss of their plant by fire and they are unable to handle any business at the present time.

Work is now in progress on the construction of a new plant, and the company will be in position to handle their business in a better and bigger way than ever when the plant is again in operation.

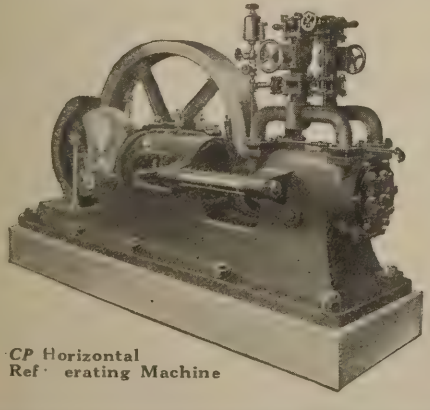
CP Mechanical Refrigeration



The Modern Method of Maintaining Uniform Temperature

For Ice Cream Freezing, Hardening and Storage

IN NO other field does ***CP*** Mechanical Refrigeration prove more valuable. It is more economical than natural ice for it requires less space and fewer men about the plant. Ice can be made on the premises with the ***CP*** System for icing tubs, cabinets, etc., at very low cost.

The ***CP*** Mechanical Refrigeration plant is strictly sanitary as dirt is confined to the boiler room and slop to the wash room away from the rooms where cream is frozen, hardened and stored.

CP Horizontal Refrigerating Machine

CP Refrigerating Systems can be supplied in all sizes ranging from ¾-ton up with either horizontal or vertical compressors and driven by belt, direct motor drive or direct Corliss engine drive as desired. Send for free ***CP*** Refrigerating Machine catalogue.

NEWS FROM FAR AND NEAR.

(Continued from page 16)

Girard, Kans.—Roselle's creamery and ice cream factory was destroyed by fire March 21st. Only the previous day workmen completed the work of remodeling the plant and adding modern machinery and new fixtures. The loss will reach $25,000, partly covered by insurance. The cause of the blaze is undetermined.

Manhattan, Kans.—Machinery of Manhattan's newest industry was set in motion recently when the Chappell Creamery Company opened for business ready to supply the demand for ice cream, "Dairy Maid" butter, milk, cream, whipping cream and other products.

W. H. Chappell, proprietor of the business, will be assisted by his son Earl, and D. L. Kent, formerly with the Beatrice Creamery Company, and an experienced ice cream maker, in the operation of the business.

The equipment includes a mammoth churn, freezer, viscolizer, York refrigerating machine capable of manufacturing six tons of ice daily, and the hardening rooms.

Gardner, Mass.—A wholesale ice cream plant will be started here by Mr. J. W. Fitzgerald, who is about to leave the retail ice cream manufacturing business.

New Bedford, Mass.— Homer J. Messier, of the Made-Rite Ice Cream Company, has recently opened his newly completed ice cream freezing plant and parlor. With the new plant in operation the company will have a total capacity of 3,000 gallons per day. The freezing apparatus, including a 400 gallon freezing tank and other equipment, together with the furnishing of the ice cream parlor represent an investment of $50,000 by Mr. Messier.

Kalamazoo, Mich.—The Beedel Ice Cream Company, a new organization, will soon start operations here.

Lansing, Mich.—Mr. John Davis of this city is planning to open an ice cream factory here soon.

Lawton, Mich.—A corporation called the Perfection Ice Cream Company has been formed here, for the manufacture of ice cream, confections, etc. Their capital stock is $1,500.

Milan, Mich.—The Milan Creamery Company of Milan, Mich., is establishing a distribution branch in Toledo, O. The company manufactures ice cream and butter and deals in Milk, cream and condensed milk.

Fergus Falls, Minn.—The management of the Fergus Ice Cream Company has been taken over by Miss Lottie Snowbeck and Francis Wilson.

Minneapolis, Minn.—George A. Ball of the Ball Pharmacy Company will start the manufacture of ice cream at the new co-operative factory soon.

Pipestone, Minn.—I. O. Dyberick, who has been with the Pipestone Produce Company for the past five years, is now with the Langenfeld Ice Cream Company of Watertown, S. D.

Billings, Mont.—The Jersey Butter and Ice Cream Company has been organized, with capital stock of $15,000. They will sell butter, ice cream, etc. Gerald E. Hogan, Judd J. Fuller, and Claude P. Danrell, all of Billings, are incorporators.

Cameron, Mo.—The Cameron Dairy has let a contract for erection of a concrete block building. It will be a 26x80 ft. one story structure, to join the present building on the north. Work will begin in the near future. The interior of new building will be equipped with refrigeration of latest approved type and special machinery for handling the ice cream business.

Mexico, Mo.—The White Eagle Dairy Company of Columbus will open a branch creamery and ice cream plant in Mexico this spring. The business of this firm will be wholesale exclusively.

St. Joseph, Mo.—The City Dairy & Ice Cream Company has been chartered with capital of $20,000.

St. Joseph, Mo.—A new plant will be erected in this city by the Greene Ice Cream Company of Nebraska City, Neb. Mr. C. D. Miller, formerly manager of the Nebraska plant, will be in charge.

Arnold, Neb.—Mr. W. K. Tabor of this city is planning to open an ice cream factory here next summer.

Norfolk, Neb.—The Lewis Ice Cream Company, headed by Tom Lewis, for many years in the ice cream business here, has opened for business in a new building. The plant is entirely new and contains new machinery. The capacity is 500 gallons daily. Additional machinery is being installed in the new plant.

Superior, Neb.—The new ice cream factory owned by Edaall and Elliott is ready for operation. Vern Rowe, ice cream maker of Omaha, has been engaged.

Statesville, N. C.—A plant for the manufacture of ice cream is being erected by the Harden-Sumers Creamery Company.

Raton, N. M.—A busines merger of interest is recorded in the consolidation of the Dwight Ice Cream Company of Trinidad, Colorado, and the Raton Creamery Company of Raton, New Mexico. F. E. Button, who has conducted the Dwight Ice Cream Company, will have dircetion of the merged business. A program of expansion is announced which will include the installation of a modern refrigerating plant and ice cream machinery at the creamery plant at Raton, which will be the main headquarters of the business.

Work has begun on an extension to the present creamery building to accommodate the expanded operations. A modern ice cream machine has been received, but is not yet in place. An ice making machine and other equipment is on the way. The enlarged establishment will be ready for full operation soon. The production of ice cream for the wholesale trade, and the supplying of cold storage for various purposes will then be added to the creamery operations.

Jersey City, N. J.—The Eckmo Ice Cream Company has been incorporated with a capital of $5,000. G. Cooper, Edw. A. Brown and Florence McClonkey are interested parties.

Amsterdam, N. Y.—The Amsterdam Ice Cream Company has been incorporated for $200,000, having taken over on March 1st, the good will, plant and equipment of Hill, Marks and Heath, Inc., of Amsterdam, and the good will of the International Ice Cream Company, in the Amsterdam territory.

Auburn, N. Y.—The first ice plant of the Dairymen's League Co-operative Association has started manufacturing in Auburn, and plants under supervision of the League will be operating soon in other cities.

Brooklyn, N. Y.—A charter has been granted to the Park Ice Cream Co., Brooklyn, which was incorporated with capital stock of $30,000. S. V. Steiner, B. Steiner and W. H. Tuohy are incorporators.

Jamestown, N. Y.—The Lake City Ice Cream Company, to operate in this city, has been incorporated recently with capital stock of $20,000. F. E. Bufton, E. P. Peterson and C. M. Tibbitts are incorporators.

Niagara Falls, N. Y.—The new plant being erected here by the Cataract Ice Cream Company is nearing completion.

Salamanca, N. Y.—An artificial ice plant and ice cream factory will be erected here by Charles J. Hubbell. Work on it will probably begin next August. The concern will be known as the Salamanca Ice Cream Company. The plant will have a capacity of 12 tons of ice every 12 hours.

Cleveland, O.—A charter has been granted to the Peerless Ice Cream Company, Cleveland, which is capitalized at $50,000. Isadore Dudin, Albert Joseph, Samuel Weinstein, Jos. Morganstern and G. Schwarm are incorporators.

Columbus, O.—The Noaker Ice Cream Co. has consolidated with the Crane Ohio Ice Cream Co., Columbus, formerly known as the Moores and Ross Milk Co., according to announcement made recently by L. J. Noaker of the Noaker Ice Cream Co.

Both companies will retain their identity and present management but will be consolidated in a business way, according to Noaker.

The Noaker Co. is enlarging its field in many ways and already is known as one of the leading ice cream companies in Ohio. Recently an additional plant was purchased in New Philadelphia and other extensions are to be made.

Noaker will remain in direct charge and control of the business in this territory.

Galion, O.—The Buckeye Dairy Company is operating a dairy and ice cream plant.

Ironton, O.—An increase in the capital stock from $5,000 to $35,000 has been made by the Ironton Ice Cream & Dairy Company.

Jamestown, O.—An ice cream plant is being contemplated by A. Jenks and C. Mauck.

Niles, Ohio.—James St. John, formerly of this city, but now located on a large farm in Johnston township, is planning on putting in a large ice cream manufacturing plant. It will be about a month before he is ready for operation.

Rockford, O.—The Casnovia Ice Cream Company and the Rockford Ice Cream Company, both of this city, will open new plants.

Urbana, O.—Welsheimer and Butler, druggists, have just contracted through Paul Smith, a former Urbana boy, representing the Frick Machine Company of Cincinnati, for a new refrigerating machine.

Duncan, Okla.—Construction of a two story brick building for an ice cream factory and creamery has been started here.

Welland, Ontario.—The Goodwillie manufacturing plant was sold recently to Martin Bros., dairymen. The building and land will be turned over to Martin Milk Products, Limited, a company which has just been organized, and of which Martin Bros. are the leading figures.

The factory, which was built in 1913, is two stories high,

and has a ground area of 135x130 feet. The new owners will use it for the manufacture of ice cream and butter.

Portland, Ore.—Manufacture of machines for the production of coated ice cream cakes is proposed by the General Products Company, organized recently by J. W. Browne, Alfred S. Rix and H. F. Sturdevant, with a capitalization of $100,000. The new machine was invented and patented by J. O. Halverson, and the first one manufactured was placed in operation at the plant of the Mutual Creamery Company recently.

Bethlehem, Pa.—An addition is being built to the present plant of the Bethlehem Ice Cream Corporation.

Brookville, Pa.—The ice cream plant, including building, machinery and good will of Clark Bros., Brookville, was recently purchased by the Brookville Ice Company and possession taken on April 1st.

Canonsburg, Pa.—The Rieck-McJunkin Company is remodeling the interior of the Charleroi Brewery building, its newly acquired property, and expects to have it ready for its ice cream and manufacture of ice productions soon.

Chambersburg, Pa.—G. Stewart Klenzing of King and Franklin streets is converting a building at the rear of his residence into an ice cream factory, and will begin the manufacturing of ice cream in the near future. He will have as a partner his brother-in-law, Robert Gabler, of Roxbury. Up-to-date machinery is being installed and they will wholesale and retail their product.

Charleroi, Pa.—P. Calistri & Sons have started the erection of a new ice cream plant. The business was started by P. Calistri 23 years ago. P. Calistri was the entire organization, being ice cream maker, errand boy and delivery man. Due to his efforts and the quality of his product, the business grew so that in 1912 it was necessary to increase the plant to a total capacity of from 500 to 700 gallons per day. During the time the business was growing, Mr. Calistri's two sons, Messrs. Jermia J. and Dee A. Calistri, were initiated into the business. The business has continued to grow so that the present plant is the outcome of this continued growth.

The building and equipment for the plant will be new in its entirety. It will have a maximum capacity of 2,000 gallons of ice cream per day.

Emaus, Pa.—Stortz & Eisenhard purchased a tract of land from Wilson Wenner on the south side of the East Penn railroad. They are erecting a large ice cream plant.

Greensburg, Pa.—Equipment for the manufacture of ice cream is being installed by the Dairy Products Company. Mr. J. U. Kuhn, Jr., is the manager of this plant.

Kingston, Pa.—Evans Brothers are now operating an ice cream plant.

Oil City, Pa.—A new ice cream plant is being started here. Mr. Sloppy of the local American Legion is the proprietor.

Perkasie, Pa.—At a meeting of the directors of the Crescent Ice Cream Co., I. P. Mensch was unanimously re-elected president of the concern.

The capital stock of this company has been increased from $50,000 to $150,000, and extensive additions will be made to the present plant.

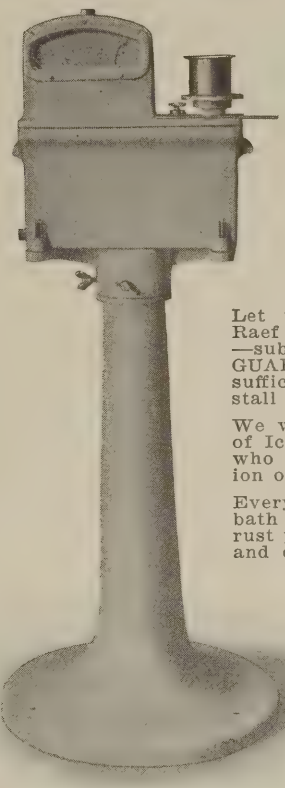
Plans have been received and approved for a 3-story brick and steel addition that will house an ice manufacturing plant of a capacity of 30 tons daily and provide storage facilities for 500 tons.

Pittsburgh, Pa.—The Pittsburgh Ice Cream Company has increased its capital stock from $90,000 to $250,000.

Smethport, Pa.—A. Miller, proprietor of the Claranett Creamery, will begin manufacturing ice cream for local consumption at his creamery as soon as the necessary equipment arrives.

Velvet Brand is the name for the proposed product, following out the similar named brand of butter sold by the creamery.

Tarentum, Pa.—The Ganor Ice, Ice Cream and Dairy Company has recently been incorporated for $100,000.



Newport, R. I.—The Aquidneck Dairymen's Association has purchased land on which it will immediately erect a terra cotta building 40 by 60 feet. The purchase has to do with the plan to manufacture ice cream. The association has already contracted with a Chicago concern for the installation of the ice cream making machinery.

Watertown, S. D.—The Langenfeld Ice Cream Company has purchased the plant of the Kampeska Ice Cream Company.

Brownsville, Tex.—C. C. Lamberth of McAllen, Texas, is to open an ice cream plant.

Seguin, Tex.—At the regular directors' meeting of the Seguin Chamber of Commerce last week, C. E. Tips was commended for his enterprise in putting in modern ice cream machinery for the manufacture of ice cream.

DE RAEF Ice Cream Weight Standardizer

The only patented equipment offered to the ice cream manufacturer for the Standardization of all makes of ice cream — Vanilla — Fruit — Nut — Sherbets—without any adjustments of any kind—no charts—no weights regardless of weight of mix—making it practical in any plant, to make an entire day's run and not to vary an eighth of a pound to the gallon.

Let us demonstrate this De Raef equipment in your plant —subject to sale. We will GUARANTEE YOU A SAVING sufficient to justify you to install this equipment.

We will send you the names of Ice Cream Plant Managers who will tell you their opinion of this Standardizer.

Every working part works in bath of special oil making it rust proof from the salt laden and damp air.

DON'T TRY TO SAVE MONEY BY USING CHEAP LUBRICANTS.

Sherman, Texas.—Branch plants will be opened at Denison and Greenville, Texas, by the Lyon-Jensen Ice Cream Company.

Sweetwater, Tex.—The Sweetwater ice cream plant, a new business institution, commenced operations recently.

Glendale, Wash.—Recently the Glendale Dairy, under the management of Floyd Sather, began the manufacture of the widely popular chocolate coated ice cream bar in wholesale quantities for local and outside confectionery dealers.

Mt. Vernon, Wash.—The Highland Dairy has opened an ice cream manufacturing plant in connection with their milk and cream service, and have already started to place their product on the market.

The added equipment is modern in every respect.

The erection of the new Highland Dairy plant, on which construction work will start soon, will permit this concern to considerably enlarge their facilities and better enable them to care for their constantly increasing business.

Lumberport, W. Va.—Lumberport dairymen are planning to start a co-operative ice cream plant here, it was announced recently at chamber of commerce headquarters. Plans for the carrying out of the project were made at a meeting in Lumberport which about fifteen dairymen attended.

Wheeling, W. Va.—H. P. Hauman, who has been local cashier of the Imperial Ice Cream Company, left recently for Winchester, Virginia, where he will be the manager of the new plant of the company at that place. Mr. Hauman has been in the employ of the Imperial Ice Cream Company for several years.

J. J. Talbott, former bookkeeper at the local plant, has been advanced to the position of cashier.

B. D. Wells, formerly with the Imperial Company here, has been made manager of the new plant at Steubenville, O.

C. J. Dickman, also of the local Imperial plant, has been appointed manager of the new plant at Washington, Pa.

Fond du Lac, Wis.—Fourteen members of the Northwestern Ice Cream Dealers' Association held a get-together meeting in this city recently.

Ten cities of the Fox River valley district, including Fond du Lac, Oshkosh, Green Bay, Appleton, Sheboygan, Manitowoc, Shawano and other points were represented at the meeting. The association holds these conventions twice each year and they are for the purpose of having a discussion as to general conditions and toward the promotion of greater service and efficiency in the business.

Janesville, Wis.—Twenty ice cream manufacturers of Southern Wisconsin came to Janesville one day recently to hold an all-day get-to-gether. According to Charles P. Touton, of the Shurtleff Ice Cream Company, no business matters were taken up.

Among those present were: R. W. Minett, Waukesha; G. H. Kothlow, Edgerton; G. R. Courtright, Rockford; F. J. Schmidt, Elkhorn; Mansfield Caughey Co., Madison; Mr. Hass, Madison; C. A. Carver, Oshkosh; W. R. Meier, Ft. Atkinson; A. O. Sorge, Reedsburg; Mr. Whiting, Lake Mills; George Cronin, Janesville.

Medford, Wis.—The Suits Ice Cream Factory has been reopened for the summer work.

Plymouth, Wis.—William A. Brannon has disposed of his interest in the Mel-O ice cream plant and will leave for Madison where he will again serve as a chemist for the French Battery Carbon Company. He and Carl Krohn, both of Madison, came here a year ago and took over the establishment.

River Falls, Wis.—M. M. Walters of River Falls has added an ice cream making machine to his creamery outfit, and will sell the product direct to the consumer.

Wisconsin Rapids, Wis.—It is reported that the Mory Ice Cream Company of Stevens Point and Appleton are planning to open a new branch factory in this city this season.

NEW FREEZER CATALOG.

The Ice Cream Review office has just been favored with a copy of 1922 catalog of the Emery Thompson Machine and Supply Co., 271-75 Rider Ave., New York City. This is a neatly arranged booklet of 32 pages, showing the various types of Emery Thompson Freezers and giving a general description of each and of the parts of which it is composed.

The Emery Thompson Company is also manufacturing an underdrive mixer, which is an outfit for making ice cream without mechanical refrigeration at a very low manufacturing cost. Copies of this catalog may be secured from the Company at the address given above.

MIDLAND PRODUCE CO. MAN IS SECRETARY.

This man is the new secretary of the North Dakota Ice Cream Manufacturers' Association. He is G. B. Caraway, manager of the Midland Produce Company, Fargo, North Dakota.

G. B. CARAWAY.

North Dakota has an active little association. It is not little from a standpoint of accomplishment, however for in this respect it can be placed on an equal basis with other associations, having many times their actual membership. The North Dakota Association is coming right along, and has planned many things which will be of benefit to the ice cream men of the state.

Below is where Secretary Caraway labors. The Midland Produce Company is doing a fine business. Their office is shown on the right of the picture, and their retail store on the left. They have three churns and two ice cream freezers in operation, which last year made about 700,000 pounds of butter and 100,000 gallons of ice cream.

INFORMATION WANTED.

It was reported a short time ago that a certain ice cream manufacturing company was specializing in the manufacture of brick ice cream. One of the subscribers to The Ice Cream Review is very anxious to obtain the name of the manufacturer, who is making nothing but the brick ice cream. If any of our readers happen to know who is engaged in this specialty, they would confer a favor on us by sending the name to The Ice Review office.

A LIVE WIRE BOOSTER.

Readers, meet Mr. Carl Glitsch, the wide-awake, up-to-the-minute head of the New State Ice Cream Co., of Oklahoma City, Oklahoma. In addition, Mr. Glitsch is a leader of the local Elks, past Chief of Police of Oklahoma City, and a leader in politics.

CARL GLITSCH.

He is the type of man who will give you a pleasant reception, listen attentively to what you have to say, and make his decision NOW. He is one of the "Let you know later" kind.

His friends characterize him as a man free from petty considerations, a real man among men, a man they are proud to call friend.

It may be gathered that no matter what Mr. Glitsch gets into he is not content to be merely a spectator, but takes a prominent hand in running the show. Men of this type are bound to make a success of whatever they undertake, because they put behind it the force and enthusiasm that gathers momentum which is effective against any difficulties that may be encountered. More power to you, Carl! The industry needs more men of your type. Whatever you attempt, you may be sure there will be plenty of us rooting for you, for all the world loves a booster of your type.

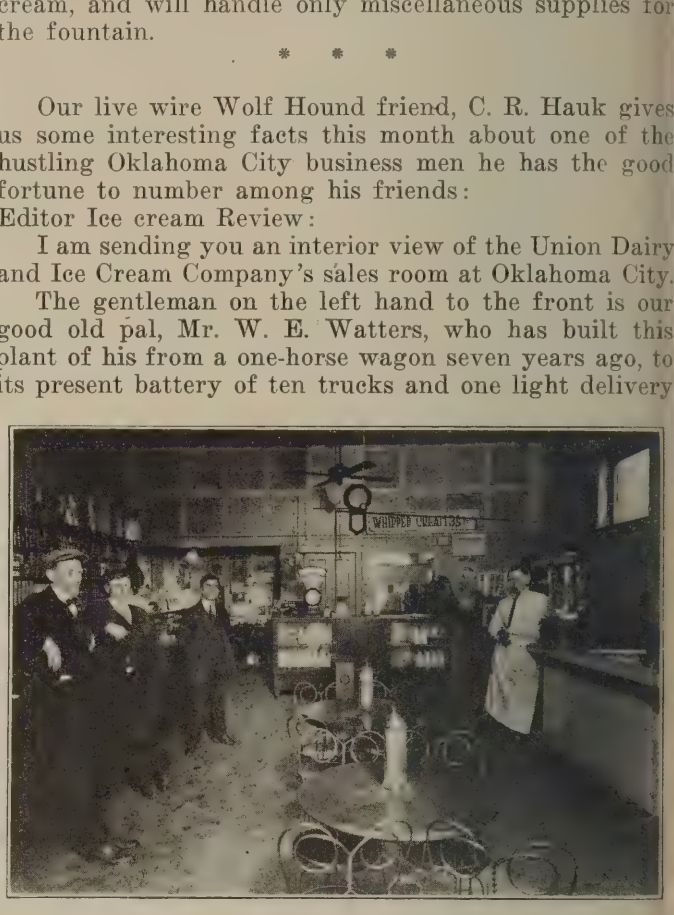
FRICK ICE CREAM COMPANY ENLARGES PLANT.

Due to an increase in business, the Frick Ice Cream Company of Corsicana, Texas, was obliged to enlarge their plant. They have built an addition to their present factory for can storage and wash room, in order to give more room in the packing department, and have installed in the factory laboratory equipment, furnished by Mojonnier Bros., Chicago, and a new freezer furnished by the J. G. Cherry Company, of Cedar Rapids, Iowa.

The plant will be under the active management of Mr. H. M. Montgomery. Mr. Frick will give most of his attention to his new organization at Corsicana, the Frick Hoop Company. Mr. Montgomery has been connected with the Ardmore Ice Cream Company and the Southern Ice and Utilities Company of Texarkhanna. He has been with Mr. Frick since the founding of this company at Corsicana.

Due to the expansion of their trade territory, this company will concentrate on the manufacture of ice cream, and will handle only miscellaneous supplies for the fountain.



* * *

Our live wire Wolf Hound friend, C. R. Hauk gives us some interesting facts this month about one of the hustling Oklahoma City business men he has the good fortune to number among his friends:

Editor Ice cream Review:

I am sending you an interior view of the Union Dairy and Ice Cream Company's sales room at Oklahoma City.

The gentleman on the left hand to the front is our good old pal, Mr. W. E. Watters, who has built this plant of his from a one-horse wagon seven years ago, to its present battery of ten trucks and one light delivery

Union Dairy & Ice Cream Co., Retail Sales Room.

car, all motor driven. This is another instance of what hard work and "stick to your text" methods will do for a hustler of this man's type. Go get 'em, Walt; the people of this day and age look up to your kind of business methods—broad of mind, a booster of your line, with a kind greeting for all that may call upon you, and a firm believer in advertising.

Hats off to you for the big assistance in making the last convention the biggest success ever. More power to you is the wish of all. C. R. HAUK.

"TWO NEW BOOKLETS."

We have just received two new circulars from The Pfaudler Company, one of them illustrating fittings for glass lined tanks, and the other tells us of the use of glass lined steel tanks for creameries.

In the first mentioned book a Pfaudler Flush Valve is described in detail, also the Spray Coil, the Propeller-Type Agitator and the Two-Speed Motor Drive, and all fittings which are a part of the Pfaudler Glass Lined Tanks.

Then the other booklet, the uses of Glass Lined Tanks for Creameries are outlined, also a number of users of Pfaudler creamery equipment are listed.

Either of these circulars may be obtained by writing to The Pfaudler Company, Rochester, N. Y.

MENUS for the SODA FOUNTAIN

Samples Free on Request

THESE menus are **especially** for the Soda Fountain. They are not hotel menus or restaurant menus but are printed and embossed in colors on the highest grade stock and reproduced from original drawings for the use of Soda Fountains exclusively.

15 Styles

The three shown in cut are typical designs but there are various styles and sizes to choose from.

Ice Cream Manufacturers!

HIGH CLASS INEXPENSIVE ADVERTISING

The menus are popular among ice cream manufacturers, who give them to druggists and confectioners with the manufacturer's trade-mark or advertising slogan printed on them. This is a sure and inexpensive means of advertising the ice cream manufacturer as the menus come to the attention of the customers of the retailer.

The Allis Press *Formerly* **K. C. Bill of Fare Press** **Kansas City, Mo.**

CHICAGO'S DAIRY SUPPLY CENTER.

One of our readers who noticed the new announcement in our last issue with reference to the new Chicago Headquarters of the Davis-Watkins Dairymen's Mfg. Company, has called to our attention the growing importance of a certain district in the city of Chicago.

Located within an area of a few square blocks just west of the Chicago river and the famous Loop District are many creamery and dairy supply houses and manufacturing concerns. These companies are evidently finding out the special advantage of locating near their neighbors which might otherwise be considered as their competition.

An investigation reveals the fact that the following dairy machinery concerns are located in the limited area above mentioned:

Louis F. Nafis, 544 W. Washington Street.
Cresco Creamery Supply Co., 1845 W. Van Buren St.
R. J. Wade & Co., 308 S. Canal Street.
Mojonnier Bros. Co., 739 W. Jackson Boulevard.
Kimble Glass Co., 402-406 W. Randolph Street.
F. G. Dickerson & Co., 549 Washington Blvd.
Advance Timmerman Co., 308 S. Canal Street.
A. H. Arnold & Bro., 710 W. Jackson Blvd.
Milk Drying Machinery Co., 548 W. Jackson Blvd.
Sharples Separator Co., 565 W. Washington St.
Solar-Sturges Co., 838 W. Congress St

Our reader says he remembers the time when such concerns made it a point to locate as far away from one another as possible. It is quite evident that rapid progress is being made as these men surely see the advantage of having their businesses located near together for the proper service of trade.

WARREN ICE CREAM COMPANY ORGANIZED.

The Warren Ice Cream and Ice Company has recently been organized at Warren, Indiana, and will operate in the same plant and conduct the same business as was formerly carried on by the Warren Ice and Ice Cream Company. Mr. E. O. Ellerman, president of the Elwood Creamery at Elwood, Indiana, is president of this company; Gordon Trixler, of the Huntington-Collins Ice Cream and Bottling Company, is vice-president, and Orva Sales, of the Huntington-Collins Company, is secretary and treasurer. Mr. Trixler will do the buying for the Warren Company.

It will not be necessary for this company to make any extensive improvements to the present plant now, as the building is in good condition, and the machinery on hand is adequate for present uses. The ice cream mix will be furnished by the Elwood factory, as, with the modern machinery there, a better product can be turned out, which will be more satisfactory, as they are striving for a quality ice cream. The facilities at Warren for making ice cream bars are exceptional, and they will be made here.

There was at one time a retail confectionery operated in the front rooms of the Warren plant, which was discontinued by the old company. This stand is being put in shape, and will be opened soon, and will be devoted to the sale of ice cream, wholesale and retail candy and cigars, bottled milk and cream, and ice.

Need Any Help?

NEWS ABOUT SUGAR

Items of Interest for the Ice Cream Manufacturer

THE SUGAR MARKET.

"Though the market is unsettled from time to time," says The Magazine of Wall Street," particularly after buying has been over-zealous, the trend in consumption continues upward. Both Europe and America are buying more heavily now, particularly Europe where sugar stocks have been depleted. It is now clear that Europe must become from this time on a preponderant element in the sugar situation.

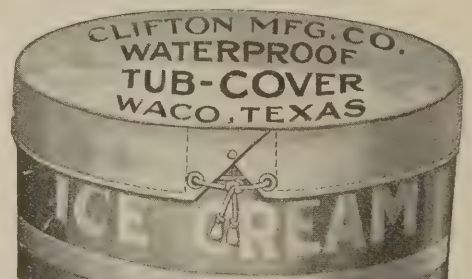
"The broad tendency of prices of both raw and refined sugar in recent weeks has been upward owing to the growing scarcity of prompt supplies. However, the rapid pace of the rise has somewhat discouraged buying by the refining interests and at present writing the market gives a heavy appearance. At present levels, raw sugar has advanced about ½ cent a pound above the lowest quotations recorded several months ago.

"Under the present conditions, the outlook is for a continued advance in sugar quotations as buying increases gradually. The outlook for the sugar industry is not so much dependent on an advance in prices as continued liquidation of stocks of which there is still an abnormal supply on hand. In this connection, it would hardly prove of value to the sugar interests to maintain a high price for their product if this were to interfere with the flow of sugar from producer to consumer. The best interests of the sugar companies will be served by following a moderate attitude with regard to prices demanded. A sudden sharp advance in the price would likely discourage buying.

* * *

RATE FIGHT IN PROSPECT.

The recent action of Arbuckle Bros., in including in their petition for the readjustment of freight rates on sugar from Atlantic seaboard and Gulf ports to Chicago territory a demand for the abolition of the long existing port differentials, apparently has precipitated a fight that will involve many interests and may have far-reaching consequences, according to Facts About Sugar. The insistence of Philadelphia and Baltimore, and of the traffic lines serving those ports, on a differential over New York was the cause of some bitter railroad rate wars twenty years and more ago, and the revival of this controversy is lining up the chambers of commerce and other shippers' organizations of the big Atlantic port cities on one side or the other.



The Chamber of Commerce of New York and commercial organizations in Philadelphia, Boston and Baltimore are said to have decided to enter the fight if the question is reopened, believing that any change in differentials applying to sugar may be used in an attempt to upset other rate adjustments of long standing.

Among refining interests the most strenuous opposition to the plan to abolish port differentials probably comes from the American Sugar Refining Company, which is just putting into operation its new Baltimore refinery. This plant, it is understood, was built largely because it was figured that it would enjoy a differential of three cents a hundred pounds over New York on freight into middle western territory. If the port differentials are abolished it would mean that this preference would be lost and that the only business advantage to be gained by the Baltimore location would be confined to the comparatively small area in which it would have the advantage over Philadelphia refineries.

On the other hand, Boston is sanguine over the proposal and has already demonstrated its willingness to fight in favor of the plan by retaining expensive counsel. The attorneys so far retained by eastern port interests are said to be men whose fees for handling such a case will run from $10,000 to $20,000 and upward.

In the meantime sugar traffic circles have more or less given up hope of getting an early decision on the Arbuckle petition on the Chicago rates, owing to its having been linked up with the port differential matter.

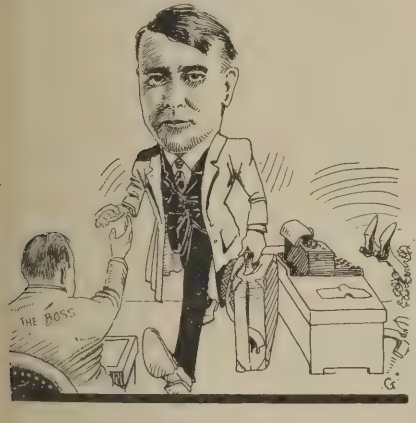
A. T. SPONAR TAKES NEW POSITION.

A. T. Sponar, until a short time ago sales manager of the dealers' department of the Solar-Sturgis Company of Chicago, has recently been made sales manager of the ice cream can department of the John Wood Manufacturing Company, Conshohocken, Pennsylvania, manufacturers of the Electric Weld ice cream cans, range boilers, etc. Mr. Sponar is well known to the ice cream industry, and he has the best wishes of his many friends for success in his new enterprise. He is a member of that well known gang of rooters for the ice cream business, known as the Dixie Fliers.



A. T. SPONAR.

BACK FROM THE WEST.

There are few things which "get by" now-a-days without the radio giving them away—but here's one that did.

Into the serenity of our office routine one day recently, walked the long-absent R. E. MacFarland, Western representative for the Essex Gelatine Company of Boston, Mass. Mac has been gone since last November and he showed up looking fine and reports a very good trip, with business excellent. His extensive trip covered the Western territory and took in many conventions on the Pacific Coast and he is now on his way to Philadelphia and other Eastern points and will return to Chicago about the latter part of April.

Many's the conjecture which arose as to where Mac (Farland, not Sennett) could be stranded out on the Pacific Coast, when the Poodle Dogs of Iowa, the Badger Flyers of Wisconsin, the Jack Rabbits of Kansas, and the Dairy Boosters of Michigan were out in full force at their respective state conventions, and Mac was missing, and we wanted to ask him about that brunette mentioned in the M. D. B. Column, but he really looked too happy—we didn't ask—we knew it couldn't be.

* * *

During the past month, we enjoyed a visit from E. Don Rogers, of the C. E. Rogers Company, Detroit, Mich., who visited Milwaukee on a business trip. Mr. Rogers reports business good and has been on the road almost continuously since last October. He left here to attend the monthly meeting of the National Dairy Club of Chicago.

"No Tub Is Stronger Than Its Bottom"

Government statistics show the average life of an ice cream tub to be 150 to 180 "drops." Records kept in several plants where B. L. R. Hoops have been in use show that tubs so equipped will stand upwards of 500 drops without loosening of staves or breaking of chimes.

Six Economical Features of the

B.L.R. Reinforcing Bottom Hoop

1. Constructed of 16-Gauge Rust-proof Steel, B. L. R. Reinforcing Hoops will outlast the life of the tub.
2. B. L. R. Reinforcing Hoops are rust resisting and non-corrosive because of the special process of Parker rust-proofing.
3. B. L. R. Seamless Reinforcing Tub Hoops replace the bottom hoop on the tub. The rim extends 1¾ in. up the side of the tub and covers the bottom 3 inches.
4. The center opening in the hoop permits all the water to drain out. No water can remain between the wood and the metal.
5. B. L. R. Reinforcing Hoops cost less than making the usual tub repairs each season.
6. B. L. R. Reinforcing Hoops permit more business with less tub investment by keeping all tubs in actual continuous service.

SIZES

The Hoops are furnished in the following sizes:
15½ in. 15¾ in. 16 in. 16¼ in. 16½ in. 16¾ in.

SMITH BECOMES A BENEDICT.

Smash! Bang! There goes our heart again! And this time it's none other than C. Frank Smith, the genial and well-known representative for the John W. Ladd Company of Detroit, Mich.

Mr. Smith will combine pleasure with business this trip; he and his bride, who was Miss Georgia Lawrence of Oil City, Pa., will spend their honeymoon in the South and West and will be gone about two months. Mr. Smith will be covering his usual territory for the Ladd Company.

His many friends will join THE ICE CREAM REVIEW in wishing the newly-weds much prosperity and happiness.

ME.

WHY BE SO DISAPPOINTED!!!!!!

Miss Ima Booster, who attended the Michigan Allied Dairy Association Convention at Saginaw, Mich., surely must have had a good time in trying to find out who she could flirt with. It seems to me she did not take time enough to study the men through, for they all have good qualities.

For instance—there's Howard Black, the Widlar Company representative, who is a nice, good-looking chap, young and pretty. He could be caught very easily, for he left his wife at home.

Then, if Ima was wanting for hearty laughter, she should have taken on A. J. Miller of the Sanitary Tinning Company, Cleveland, for he can't be beat and he has only a few gray hairs, just enough to make him look good.

Also, she could have had Bill Finch. He is a first-class jollier; he has no equal; and he can entertain fine. Do not know where his wife was, but probably would not be in sight. Bill likes his cider and cigars.

Now don't you think, Ima, these would have been better than the ones you picked? Now let's see, who else did she miss in her choice? There's Jim Hill, Diamond Crystal Salt man, he is a hummer and full of jokes. E. W. Stewart, the United States Gelatine salesman, he was very lonesome and needed company. And Henry W.——— who represents the Daigger Company, is such a fine boy and an extra good dancer, why did you not catch him? You surely made a mistake there? And so many more of those good-looking salesmen—you either missed or failed to see them. It may be the one she was actually looking for, could not be there on account of being detained out on the coast on business

—and that's our good friend R. E. McFarland, who is so tall and handsome a chap that we couldn't blame her for not being able to find anyone at the convention to suit her.

A Michigan Dairy Booster.

* * *

HE HAD THE WRONG ONE THAT TIME.

Well, Mr. Michigan Dairy Booster, I hate to spoil your day, but you are a punk guesser. I'm not going to give it away as to who you are, but for your own benefit, just to prove to you that I am a better guesser than you, I am putting your picture here to show you that I have guessed who you are—I don't want to give your identity away so that all the supply men will have the chance to "guy" you to death; but really, doesn't it look just like that picture Ima spoke about in the January Review?

I am surprised at you for thinking that I was there—and you didn't even see me! Why you'd be one of the first boys I'd look for. You see, the boss left me at home—I wanted to go all right—for I think the ice cream supply men are the best on earth—but the train pulled out and they forgot to put me in their grip, and in spite of all the kind invitations you sent for me to attend the Michigan convention, the grim hand of Business held me and I couldn't get away.

"Why, Mr. Michigan, I never would have said all the cruel things Ima said about the supply men—I'd have told a white lie if I'd have died in the attempt. That alone proves I didn't write the article.

Now, Mr. Booster, let's take your letter apart and my answers will prove that I have an altogether different view of things than you surmised I had under the guise of Ima Booster.

Your first paragraph is "most unkind"—as Harry Coleman would say—in the first place I don't have to flirt—did you ever see a duck take to water? Well,

figure it out for yourself. Then, you mention Howard Black—why, if I'd been in Ima Booster's place, I would have found Howard right away, and I'd have asked his forgiveness for the bet I never paid. And just wait until he reads that you called him "pretty" and he'll pan you. And A. J. Miller, do you think I would have passed him up? A fellow whose wife serves chicken dinners like Mrs. Miller does, and who takes you around Cleveland and shows you the town like he does? Not on your life—his would have been one of the first hands I'd have grasped, with inquiries for the wife and kiddies if I'd been there. And I'd have booked a dance with him first crack—for didn't we have a heel-spinner in Buffalo? And Bill Finch—I haven't met him yet but if he's a jollier, as you say, most likely he would have been over to the stand to get acquainted. And as for Jim Hill, I don't know him either. The only Jim Hill I know is of railroad fame. But you say he travels for Diamond Crystal Salt, and I didn't know he got railroaded from the Great Northern to Salt, but then, as the saying goes, "when it rains, it pours"—well, if it stopped at the Diamond it might interest me, but I can't do so much for the salt part. And Mr. Stewart, thanks, I met the gentleman in Chicago at the Illinois convention, and it's too late for you to make any dates for me with him. And Henry W.—Lawdee! Michigan, he doesn't like blondes, didn't you know that? He falls for the brunettes every time—but I do admit that he is some dancer—for we tripped the light fantastic in Milwaukee and I never thought I could dance until I found that I could follow steps like Henry W.'s.

And last comes the prize shot—MacFarland—I admit that he is "tall and grand" but didn't you know that some awful brunette captured him long ago? Well, well, you are behind the times. What's the use of crying over spilt milk?

Speaking of handsome men at the Michigan Convention, you missed a few yourself—I know a few more and I wasn't even there. What say you about the beauties of Jack Hickey and Don Rogers and O. E. Harwood, and John W. Ladd and Roscoe Moon and L. A. Kline and Fred Hollweg and R. J. Decy and A. Senor and a few of the really good looking ones?

Come on you famous pool player—snow again—you were in the wrong drift. The vital question is—who is this Ima Booster anyway if she isn't.

ME.

* * *

MICHIGAN DAIRY BOOSTERS NEWS.

By C. J. Yuncker.

S. H. Weeks is installing a Dairy and Ice Cream plant in Galion, Ohio, and began operations early in April. A. H. Warner is his butter and ice cream maker.

* * *

The Ashland Sanitary Dairy Co., Ashland, Ohio, has completed the new two story addition to their plant; and their new cooling room is a good size to handle their milk and butter. They can store 1,500 gallons of ice cream at a time. They bought two new Creamery Package 300 Gallons Capacity Mixing Vats, also a twelve ton York Compressor and a Blue Line Bottle Washer, also have added a numbe r of Electric Motors to the plants to operate the different machines. They will also put in a new Ice Cream Freezer, motor equipped.

* * *

The Isaly Dairy Co., Youngstown, Ohio, is doing a big business and has a very large and fine plant. Their retail room is of good size and their counter ice cream cabinet is cooled from the refrigeration room. They carry in this cabinet seventeen kinds of brick ice cream. They are contemplating operating twelve retail stores in Youngstown, O., and surrounding towns to retail their own dairy products and ice cream. Each store will have an ice cream cabinet counter to hold seventeen five-gallon cans of ice cream and also space for brick ice cream. They will always carry seventeen flavors in their cabinets and each store will have a two ton York refrigeration machine to keep their ice box and ice cream cabinets cool. It has so far proven a success with them to carry the seventeen kinds of flavored ice cream as the public likes a change in flavors. Leave it to Mr. Chester Isaly, manager of this plant, for he surely knows how to please the public in ice cream.

* * *

The Perfection Dairy Co., Kent, Ohio, has added a 10-ton Ice Machine; this doubles the capacity. They also bought a new 2-ton Federal truck. They are doing a good business and the manager, Mr. Earl Tatjenhorst, is well liked by all, therefore the reason of success to this new firm.

* * *

E. W. Patton of Lisbon, Ohio, is now manager of the Ravenna Ice and Milk Co., Ravenna, Ohio. Here's hoping for his success.

* * *

E. J. Davis & Co., Oberlin, Ohio, have moved into their new ice cream and candy factory.

* * *

The Tawney Ice Cream Co. of Barberton, Ohio, is in the new building and is doing a good business. They have a nice plant.

* * *

F. A. Martin, Sandusky, Ohio, says his candy factory is doing a fine business. The ice cream factory is also doing well.

* * *

The Bryan Ice Cream Co. of Bryan, Ohio, is making an ice cream cutting machine for cutting bars to dip in chocolate.

* * *

Caramala Ice Cream, cut and dipped in chocolate, makes a fine dainty to eat; the two flavors blend together very nicely by adding some red cherries in the ice cream. You will have a very nice looking bar; everyone so far who has seen it, says it is a very rich eating piece.

* * *

Joe Huhn, Van Wert, Ohio, has moved into his new location with his retail candy store. C. M. Young also moved his drug store into the same room, so both parties put in all new up-to-date fixtures, thus giving the place a very fine appearance. Mr. Young's drug store is on the left side of the room, and Mr. Huhn's candy store is on the right.

* * *

Mr. Huhn also has his candy factory and ice cream plant on the second floor of the building. He has also installed a new Walrus soda fountain.

* * *

Joe Dunirt, Upper Sandusky, Ohio, has bought a 4-ton York refrigeration plant and an Emery Thompson freezer.

Albert Joseph, Upper Sandusky, Ohio, has purchased a 4-ton York refrigeration plant and an Emery Thompson freezer, and is now erecting a new building to be used as an ice cream factory.

⚜

Don't let that used machinery of yours stand in your way. Turn it into cash by advertising it for sale in the "Review" Want Department.

A COMPREHENSIVE MERCHANDISING AND ADVERTISING CAMPAIGN.

Greater Sales Possibilities of Bulk Ice Cream Through the "Sealright Way."

We are in receipt of a very beautiful and complete portfolio issued by the Sealright Co., Inc., and furnished to users of the company's filling machines. Inquiry of Mr. Fred E. Eriksen, advertising counsel for the company, elicited the following:

Unless it is fully determined beforehand that the adoption of a "new method" in any industry bears a fundamental basic relation to existing needs of the industry, unless the new method successfully meets these needs, is practical, economical, affords a better way and will result in greater and more profitable business, the adoption can still only be regarded in the light of an experiment. Before any new method is finally presented or offered to an industry, its practicability and worth should be pretty well established.

The portfolio entitled, "The Sealright Way," copy of which you have received, deals with an exceedingly important phase of the ice cream industry. It is not merely the result of our own theory, idea or opinion, but is, as stated in its introductory pages, based on the experiences of many ice cream manufacturers situated in various sections of the country. The preparation of this portfolio, therefore, was of long duration, covering a period of careful observation, investigation, study and application. The "Sealright Way"—bulk ice cream in package form—was not formally announced as a method nor was it so advertised until eighteen months had elapsed from the time it was adopted by the first ice cream manufacturer, who, by the way, is still even more enthusiastic about it.

The fundamental, basic idea back of the "Sealright Way" is simply this. Bulk ice cream is the mainstay of the industry. People prefer bulk ice cream in the plain flavors. Certainly you derive, in the long run, greater profits from the manufacture of bulk ice cream than brick. The retailer has not always been able to handle bulk ice cream to a profit in the dip method—filling the ordinary paper pail at the fountain, giving over-measure and sustaining losses of yield to constant exposure of cream to the outside, warmer air.

Consumers have been reluctant to "carry home" bulk ice cream in paper pails. There was always present the fear of leaking or dripping and the unpleasant result of finding the cream soft and mushy when home was reached. The "Sealright Way" removes all of the foregoing objections and will positively open the way to greater sales.

However, the proposition must be thoroughly understood and for this reason we prepared the Portfolio—dividing it into three main divisions (1) to show the manufacturer how the "Sealright Way" must be handled in his own plant; (2) how it must be presented to his retailers and how they in turn must "carry" it on; (3) how to present the merits of the "Sealright Way" to consumers—reaching the consumer through advertising, both by the manufacturer himself and through dealer co-operation. The advertising plan as outlined in the Portfolio covers everything in detail and ice cream manufacturers already report their entire approval of the practical suggestions offered.

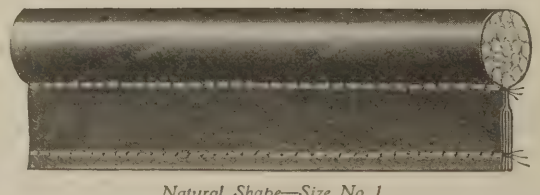
Space does not permit our going into details here. The entire plan, as contained in the Portfolio, is most comprehensive. Its greater worth is due to the fact that the various steps of the plan are based on actual experiences rather than theory. The portfolios are not intended for general distribution. One copy is sent each purchaser of Sealright Filling Machines, those manufacturers who have adopted the "Sealright Way." To them, the portfolio is of inestimable value.

The success attending the "Sealright Way" is not of a temporary nature, dependent on its newness or speculative possibilities. It is more permanent. It originates from an ever-pressing need of long standing. And for the simple reason that it meets this need practically, efficiently and economically for the manufacturer, retailer and consumer, because it is so fundamentally correct in principle, it is not to be wondered at that "Sealright Way" is receiving so enthusiastic and responsive recognition.

But, as in everything else, it must be thoroughly understood to be successful. For this reason, we went to the pains and expense to prepare the portfolio, explaining as it does, the "Sealright Way"' and giving to the manufacturer a comprehensive merchandising and advertising plan whereby he can attract a greater volume of business to his profit.

ILLINOIS ASSOCIATION OF ICE CREAM MANUFACTURERS.

Ice Cream Review:



The Illinois Association held seven sectional meetings during the past winter, as follows: Centralia, Litchfield, Quincy, Rockford, Danville, Bloomington, Springfield. All of these meetings having been called for the purpose of discussing ways and means to bring more stable market conditions, closer co-operation, and a better understanding among the manufacturers in the territories affected.

The meetings were all splendidly attended, from thirty to sixty manufacturers having been present at each one.

Numerous subjects came up for discussion, including express rates, chocolate coated ice cream bars, the 1921 revenue act, etc.

POSITION WANTED—By man of good moral character as assistant ice cream manager seeking good employment. Address: Wm. Scheid, Rosendale, Wis. 4-22

FOR SALE BARGAINS

FOR SALE—Wholesale ice cream plant in city of 20,000 population, 4 railroads, large territory, located in heart of city, largest ice cream business in territory. Up-to-date plant. Also butter business locally and sub creamery within forty miles in dairy belt. Will sell both plants. Address: R-238, Ice Cream Review. 3-22tf

BUSINESS OPPORTUNITY—For a live wire man with $25,000.00 cash, and about $100,000.00 worth of pep, there is a wonderful opportunity with one of our customers, an Ice Cream Manufacturer. The business is 19 years old, located in a town of 60,000 people and does 100,000 gallons a year, with another 100,000 gallons in sight when the right man gets on the job. Merely investing the money will not do—the new man must be a merchandiser and buckle right down to increasing sales in a market that has great possibilities yet undeveloped. Eventually he will be able to get control. The present owner is square and trustworthy. All he needs is the financial and promotional assistance of a Go-Getter. All the figures and the plant are open to inspection. If you can qualify with the money, the energy and the ability, address Frederick C. Mathews Company, P. O. Box 834, Detroit, Michigan. 4-22

FOR SALE — One Creamery Package Wizard mix vat, copper lined, copper top, metal sides, complete with cover. Price $225.00 net F. O. B. Milwaukee. One Mansion House motor, driven brick cutting machine, one-half horsepower motor, 220 volt, with cutting boards for pints, quarts, 10, 8 and 6 slicers. Price $135.00 net Milwaukee. This brick cutter has never been used since it was returned from the factory where it was thoroughly overhauled. This cutter was being kept in case of emergency or a breakdown with our other cutter. The Geo. C. Mansfield Co., Milwaukee, Wis. 4-22

FOR SALE—Ice, Ice Cream and Cold Storage Plant. Thriving distributing center, southern West Virginia. Property consists of three story large and modern brick building and up-to-date equipment for producing 55 tons ice and 500 gallons ice cream daily, as well as steam, condenser and storage facilities for bottling purposes. Plant capable unlimited increase in ice cream production. Excellent field. Business well established. Present owners selling, due other affairs preventing giving management proper attention. Address: Wyoming Ice and Bottling Company, Box 97, Tralee, West Va. 4-22

FOR SALE—Creamery and ice cream factory in a good town in N. W. Iowa. Population 5,000. Good shipping point. Good reason for selling. Easy terms. Address: R-252, Ice Cream Review. 4-22

FOR SALE—One-half interest in a well established ice cream factory and bottling works, in one of the best cities in Minnesota. Good paying business but have other business interests and can not give it my personal attention. Address: R-262, Ice Cream Review. 5-22

FOR SALE — By Wisconsin creamery, sweet pasteurized cream butter for ice cream making, also 91-92 score print butter. Address: R-210, Ice Cream Review. 5-22

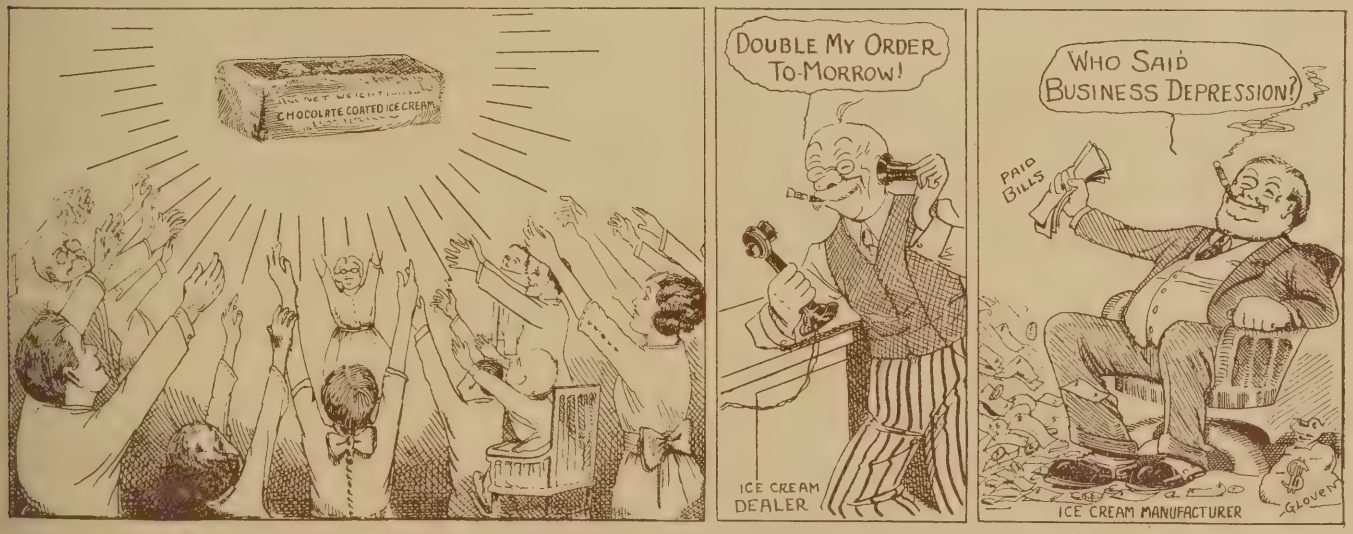
Fine opportunity to cater to college and high class city trade for specialties, like ices, sherbets, etc. No other such plant in city of 20,000 inhabitants. Address: R-250, Ice Cream Review. 4-22

Chocolate Coated Ice Cream SUPPLEMENT

HERE is the promised supplement devoted exclusively to the chocolate coated ice cream business. Here are pages and pages of interesting material gathered from all parts of the nation and embodying the experiences of the most progressive men in the ice cream industry.

The chocolate coated ice cream business is a new business. So new, in fact, that fundamentals are few and far between. It lacks the experience of seasons and years by which certain rules are established. The business man who refuses to be guided by anything except "the lamp of experience" has no business making chocolate coated ice cream. It remains for the other kind of a business man—the one willing and anxious to tackle a new thing—to make a success of it.

It may surprise some folks to learn that dipping ice cream in melted chocolate is not new, in spite of the fact that marketing it on a big scale is very new. Just to prove that putting a chocolate wrapper on ice cream is not new we quote from "Standard Recipes for Ice Cream Makers," by Val Miller, published in 1909, as follows:



ICE CREAM CANNON BALLS.

Mould some round balls extra hard as for individuals, then melt some thin chocolate, thin it down with cocoa butter, let it cool until the most of the heat is off; now have two wire forks, drop a frozen ice cream ball into the chocolate, turn it upside down quick, and with your two forks, set it out on your tray, and then immediately in your ice cabinet or iced up can.

Ice cream manufacturers have had the opportunity for all these years to make these "cannon balls" and supply them to their trade. Surely the suggestion to make them in a different shape must have appealed to some manufacturers if they hesitated about putting them out in a round form.

What, then, was the reason for letting the years go by without making chocolate coated ice cream one of the specialties of the ice cream business? There was no demand for such a product, to be sure, but the consumer can't be expected to demand something that he knows nothing about. He didn't know, during all these years, that ice cream coated with good chocolate makes a delightful confection. Probably few ice cream manufacturers knew it.

How did it happen, therefore, that right in the dead of winter—the most unfavorable time of all the year to interest the consumer in an ice cream specialty—there should spring up such a demand for an ice cream product that thousands of ice cream plants have been taxed to their utmost capacity, and usual winter losses have given way to winter profits?

The answer is **advertising**. The consumer was told about this new ice cream specialty. He bought it and liked it. He told his neighbor about it and the demand increased to a point where it could not be supplied. Ice cream manufacturers worked frantically to meet the demand and called loudly for plant equipment suitable for quantity production. Inventive minds met this emergency until now it may be truthfully said that the chocolate coated ice cream business is well established, so far as production is concerned. Chocolate manufacturers have done their part. They have experimented and produced a product highly suitable for this particular business.

It is not surprising that the demand for chocolate

PACKAGING MACHINES HAVE REVOLUTIONIZED THE PACKAGE ICE CREAM BUSINESS.

coated ice cream has fallen off in some sections. Whenever the demand exceeds the supply of any food product there is a danger of lower quality and eventually a lessened demand. Then, too, some business men make the mistake of spending less money for advertising when the demand for their goods exceeds the supply. Why advertise when one has all the business he can handle? Such men make the mistake of looking upon advertising only as a means of **getting** business. They forget that advertising is necessary to **hold** business.

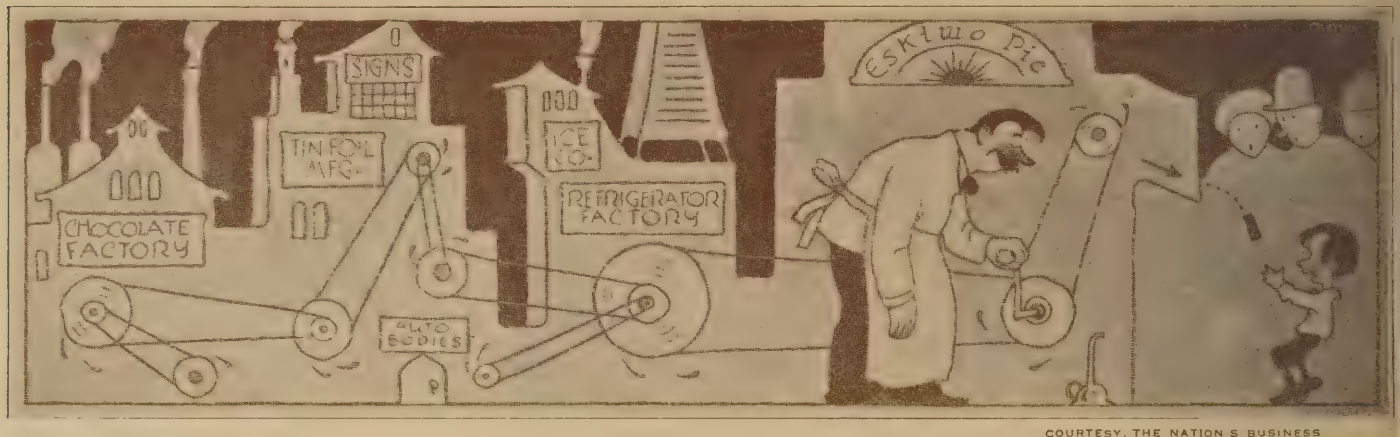
Where the demand has held up or increased it will be found that high quality goods have been put upon the market. Manufacturers have not allowed excessive demand to influence the quality of their product. They know that folks like good ice cream and good chocolate, and that poor ice cream or poor chocolate, or both, don't make a good chocolate coated ice cream product. They have used the best of everything and they have followed their product right to the consumer to insure his getting it in the right condition. Such is the power of advertising when backed up by goods of merit.

There are those who look upon chocolate coated ice cream as a novelty, depending upon the whims of the consumer for its demand. We can not subscribe to any such theory. From all the information we have been able to collect we can draw but one conclusion. Chocolate coated ice cream in some form or another is here to stay. It is an ice cream specialty just like the ice cream sandwich and the ice cream cone. Make it good, keep it good, and advertise it and the consumer will continue to buy it. He will buy it because he likes it as a confection and a food.

In the April issue of "The Nation's Business," a monthly magazine published by the Chamber of Commerce of the United States there appears an interesting article by Mr. Warren Bishop, devoted to the subject of chocolate coated ice cream from which we quote extracts and which emphasizes in a most striking way the tremendous power of advertising. The extracts follow:

"Marketing a new ice cream product in the winter of a year of great depression. It can't be done!"

"It can be done, and it was done. Once more there is proof that the buying power of the public isn't dead. It has been atrophy of selling power that has struck business.



"The man who did it has built himself up a daily income in excess of $15,000—according to such of his acquaintances as take delight in multiplication, and forgetting, momentarily, the costs of sales—in less than four months, and he's done it out of dimes by original methods and by moving right against the prophets of evil and the men who said 'it can't be done,' and 'the times aren't right for any new venture.'

"The man is Russell Stover, and the product he has started the nation to using is a chocolate coated ice cream bar. Three or four thousand ice cream and candy salesmen would probably have told you, if they'd been consulted in advance, that the idea was not worth much, that it couldn't be marketed.

"But Stover thought differently and went ahead. By the first of February, after only about three months of drive, so many manufacturers had been licensed that the American public was eating some 4,000,000 chocolate coated ice cream bars a day and paying Mr. Stover 5 cents for every dozen sold.

"You might have told Mr. Stover that ice cream was a seasonal industry, that it couldn't be marketed in quantities in midwinter, but he wouldn't have listened.

"He had an idea and a name for it. The idea was simple and the name was fetching. 'Eskimo Pie!' It's

COURTESY, THE NATION S BUSINESS

written up all over the United States now, on newspaper and magazine pages, on billboards and on shop windows. Yet how long ago was it that you first heard of it? Hardly a dozen weeks. The Stover idea was that the children, the women, and the men of the country would be made to buy a luxury product that should be sold **as a luxury,** for a fair price. Moreover, the market was as broad as the population and there was no end to the repeat orders.

"The idea of a coated ice cream isn't new, nor is the idea of covering ice cream with chocolate. Hot chocolate sauce on ice cream is a familiar dessert. But Stover found a man who could prepare a coated ice cream in a practicable, sanitary, salable way. Methods of preparation and the name were protected by patent and copyright, and a very few trial sales showed a waiting public appetite for ice cream robed in chocolate and protected by a wrapper of tin foil.

"Here's a description, first hand, of how it was done, given by an advertising man who was hastily summoned to Chicago by Stover soon after he really got to work:

"I found him in a dramatic state of siege. He retired from one hotel bedroom into another, strategically seeking inner and yet further inmost sanctums for a calm that could not come. He had started the Eskimos marching across the country, preceded by dozens of salesmen and demonstrators and hundreds of letters and telegrams, and the grand headquarters of the invading forces found difficulty in keeping contact with the front lines. But so many messengers did come in to salute and report that finally Stover had to stop retreating into corner bedrooms, and sleep with his clothes on, on a couch, and do business between winks.

"He had started in a small way. But he sold his idea so cleverly and thoroughly to the first few licensees that their competitors and even their distant fellow-

National Buy Word:

BASEBALL

Original chocolate coated ice cream confection. Not a fad. Can be sold, served and eaten anywhere, in ice cream parlors, restaurants, moving picture theaters, soft drink stands, conventions, baseball games, outdoor fairs and meetings. Also in big demand for home dessert, dinner parties and dances.

Big profits now being made by manufacturers, wholesalers and retailers handling BASEBALLS. Be first in your territory to secure franchise to manufacture and sell this novel frozen confection. Nothing like it on the market.

manufacturers began to want to talk to Mr. Stover. The public liked the pie — instantaneously sometimes, and with gradual enthusiasm elsewhere. But the mere audacity of offering ice cream done up in a tinfoil wrapper, to be handed out over a counter in a heated room, made the public taste once. And if the ice cream bar was good, it tasted twice and is still tasting.

"His small-way start soon became literally a national progress. With typical audacity he put so many salesmen into the field that, during some of those siege days in the hotel, he really didn't know how many he had. Right behind them he immediately marshaled a national advertising campaign. He did the daring, persistent, aggressive thing so thoroughly that the Eskimo Pies never stopped even once to bivouac, but marched clear on from coast to coast. And now two or three million persons every day are buying ice cream, done up purely in a luxury form, at a luxury price, in the middle of the winter!

"It isn't only Russell Stover who has profited by his defiance of precedent in selling ice cream in a winter when 'nobody would buy anything.'

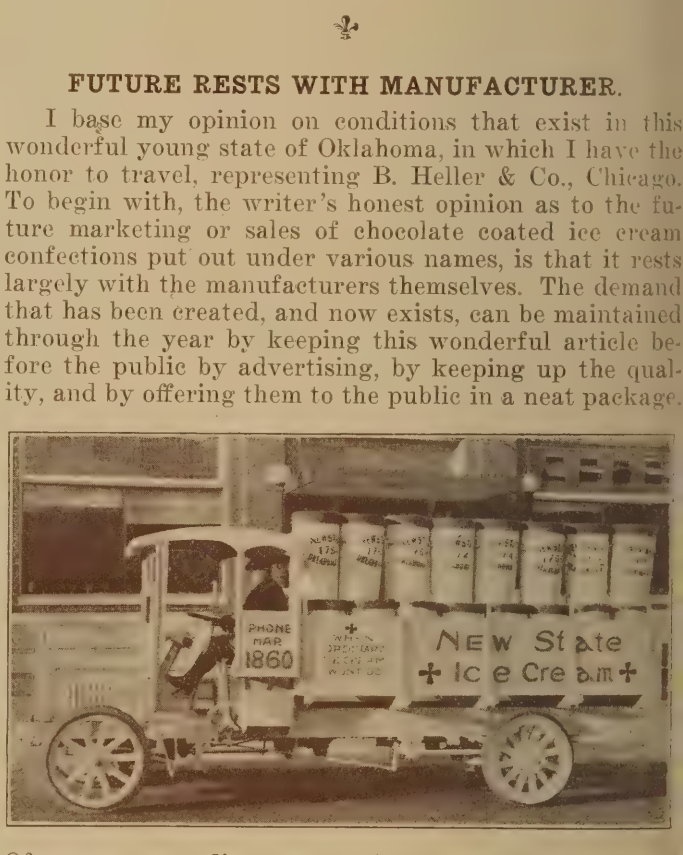
"Ice cream plants make profits in August and run into deficits in January, usually. Eskimo Pie has put many ice cream plants even with the world in winter, in the last three months. Results? The members of the Association of Ice Cream Supply Men who sell them their essential ingredients, equipment and supplies under one of the strictest codes of ethics in force today in any industry, are finding fewer accounts still open on their books of last fall's purchases. And the ice cream manufacturer buys 150 varieties of equipment and ingredient for his plant.

"Cocoa and chocolate manufacturers recently found themselves — their export markets dead — faced with prices below those of the pre-war days and with great stocks of raw and manufactured product and no outlet visible. Today the licensees of Eskimo Pie's manufacture are buying chocolate coatings in carload, five-figure lots. And chocolate manufacturers are paying bills.

"When the war ended there was a glut of tinfoil in the hands of manufacturers here. They thought, and thought, and thought some more, but there were, after all, just so many markets for their goods. Now tin-foil houses are rushed with orders for Eskimo Pie covering."

The advertising campaign started by Russell Stover, referred to in the above article, has been supplemented by extensive advertising by other licensing concerns and devoted to other trade terms like "Sundae-Ette," "Baseball," "Tri-a-Cone," etc. These have all enjoyed a splendid demand and have contributed to the popularity of chocolate coated ice cream.

There are those who believe that this product will not find favor with the consumer during the summer months. They imagine all sorts of things which will prevent handling it during warm weather. To say that these conditions can not be surmounted is assuming that ice cream manufacturers are not progressive.



The writer has always been a lover of good chocolate in almost any form. Years ago we had to go without chocolate candy in the summer time because retailers couldn't handle it. They found a way and we doubt not that the manufacturers of candy prompted it. Surely ice cream manufacturers are no less progressive.

Make a good product, devise ways for getting it to the consumer in good condition and we are sure he will buy it during the summer months just as readily—yes, more readily—than during the time of "heavies" and over-due coal bills..

There are so many functions during the summer time when he is in a spending mood and in an ice cream mood. Sell him bulk ice cream, brick ice cream, ice cream cones, ice cream sandwiches and chocolate coated ice cream. The more specialties you can offer the more ice cream he will consume.

Read all of this supplement and we believe that you will be convinced that the chocolate coated ice cream business is here to stay and here for twelve months in the year.

You will be interested, too, in studying the advertisements. Note the rapidity with which suitable apparatus and supplies have been put upon the market. But a few weeks ago the industry was practically unknown. In this short time men have designed, manufactured and prepared the different appliances and supplies for the industry. Such is the spirit of American business men.

FUTURE RESTS WITH MANUFACTURER.

I base my opinion on conditions that exist in this wonderful young state of Oklahoma, in which I have the honor to travel, representing B. Heller & Co., Chicago. To begin with, the writer's honest opinion as to the future marketing or sales of chocolate coated ice cream confections put out under various names, is that it rests largely with the manufacturers themselves. The demand that has been created, and now exists, can be maintained through the year by keeping this wonderful article before the public by advertising, by keeping up the quality, and by offering them to the public in a neat package.

Of course, some dispensers of ice cream in stores would much rather do away with this article, as the profits are not so great to them as they would be in the dispensing of bulk cream in the summer months. We also know that the profit in making these bars is less to the manufacturer, owing to the extra help and the method of handling before it becomes a finished product, so as before stated, the future of this confection rests in the hands of the manufacturer, whether to lag, or to boost the product. To show what a wide-awake, up to the minute business man has been doing in the way of advertising, I enclose a picture of one of the New State Ice Cream Co. trucks loaded to the brim with their famous Polar B'ars. This entire truck load was delivered to one of Oklahoma City's leading theatres, to be distributed to each one present by two charming little actresses from the film world, who were present at the theatre to see their own picture on the screen. The writer was present, and overheard many remarks, a few of which were, "I didn't know that ice cream could be coated

Eline's
INCORPORATED

Ice Cream Coatings

Exclusively used and highly recommended by leading manufacturers of chocolate coated ice cream confections, whose reputations for producing superior quality products must be upheld.

In developing that "Melt in the Mouth" goodness, so readily distinquished in "Eline chocolate products," we have not overlooked its practicability from the manufacturers' standpoint. Eline's Polar and Yukon brands embody all the skill, scientific knowledge and great care known to the art of making chocolate coatings.

We also produce a superior grade of cocoa for the manufacture of chocolate ice cream.

TRI-A-CONE

THE TRIPLE DELICACY

CHOCOLATE COATING | ICE CREAM FILLING | CONE CAKE

IF you are an ice cream manufacturer you can profit by this latest novelty confection—the creation of the food experts of the American Cone and Pretzel Company.

We call it Tri-A-Cone. It consists of a White Rim Cone filled to the top with ice cream—dipped, rim downward, half-way into hot chocolate and frozen. It is then encased in a glassine bag, delivered to your dealers and placed in their ice cream cabinets.

Easy to Make— Easy to Sell

Easy to handle. No fuss, no muss, no smearing. And a wonderful value at 10 cents. Think how the public will grasp this delightful ice cream-cone-fection—a liberal measure of good ice cream, pure chocolate and excellent cone cake—all for a DIME.

That's the kind of real value that people want, and Tri-A-Cone fills the bill. It is a great forward step in the ice cream industry. Profits are assured to manufacturers that get on the job—***at once***.

A Special Cone for the Purpose

Our experiments have convinced us that the average cone was not suitable for this purpose. Hence the White Rim Cone was developed as especially desirable for Tri-A-Cones.

The Manufacturers' Point of View

Summary of Opinion of Ice Cream Manufacturers Everywhere on Chocolate Coated Ice Cream

AS A part of our preparation for this special supplement on the chocolate covered ice cream bar, a questionnaire that we believed covered the subject as completely as possible was prepared, and sent to a list of ice cream manufacturers selected from all parts of the country. The main problems and points of interest concerning the manufacture, sale and future of this commodity are taken up in this questionnaire, which reads as follows:

1. Do you make coated ice cream bars?.....
2. If so, under what brand?.....
3. Do you use a prepared coating or do you prepare your own?.....
4. Volume of sales weekly (dozen).....

What method or equipment do you use for:

5. Cutting?.....
6. Dipping?.....
7. Wrapping?.....
8. Are sales keeping up satisfactorily?.....
9. If not, what is the reason?.....
10. What are the prospects for summer season for this product?.....
11. Have sales for coated ice cream bars reduced demand for brick?.....
12. If so, what percentage?.....
13. Do retailers welcome this business?.....
14. Do you find it a satisfactory profit producer?.....
15. Have coated ice cream bars increased total winter gallonage?.....
16. If so, what percentage over last winter?.....
17. Have you made any effort to sell coated ice cream bars at cigar stands, grocery stores and other places where ice cream is not generally sold?.....
18. If so, with what success?.....
19. What is your estimate of total sales of coated ice cream bars per week in your city (dozen)?.....
20. If we should publish the above information, may we use your name?.....

Signed.....

Up to the time of going to press 126 of these questionnaires have been filled out completely or in part, and returned to us. The information conveyed in these replies is of such great variety, and the opinions expressed are of such wide divergence that more than a brief summary is required to cover the subject satisfactorily. The great difference in the replies to some of the questions would lead one to think that it is almost an individual problem of each manufacturer, based on his location and his methods of operation. No doubt every manufacturer and dealer will find problems and experiences that parallel his own in these replies. The first three questions may be briefly summarized:

Question No. 1.—Do you make ice cream bars?

Out of the 126 replies received, 98 manufacturers were actively engaged in making these bars; 3 were preparing to make them in the near future, and 25 did not make them. Those who did not make them and gave their reasons for not doing so were unanimous in stating that their reason was that they did not believe they could be made and sold at a profit. No figures or data were given on what this conclusion was based. However, we note that most of these manufacturers are located in the smaller towns throughout the country, and it may be that, due to the limited field for distribution they feel that their sales would not be of sufficient volume to justify the expenditure for additional equipment necessary. Since their number constitutes such a small percentage of those manufacturers making these bars, it may possibly be taken as an indication that popular demand is so great and so general throughout the country as to cause manufacturers to arrive at the conclusion that there are sufficient indications of its becoming a staple commodity to make it a wise move to prepare to make it now while the profits from the volume of business incident upon its introductory popularity may be enjoyed.

Question No. 2.—If so, under what brand?

Over 80 per cent reported "Eskimo Pie." Among the other brands represented were the following: Sundaette, Frost-Bite, Alaska Bars, Polar Frosties, Alaska Bon Bons, Yukon Dainties, Choco Pie, Igloo Cake, Polar Pie, Polar Cake and Polar B'ars.

If a digression may be pardoned at this point, allow us to remark that it is a safe bet that teachers have found a stimulation of interest on the part of their pupils in the inhabitants, fauna and geography of the frigid zone since this bar has been introduced to Young America.

Question No. 3.—Do you use a prepared coating, or do you prepare your own?

Of those who gave replies to this question, 72 used a prepared coating, 25 prepared their own, and 8 used both. Opinions differed as to the desirability of both kinds of coatings, but it would seem that it does not pay the manufacturer to prepare his own coating unless he can do it on a large scale. The kind of equipment used in the manufacture of the bars would influence this opinion to a great extent also, so that it becomes a question to be decided individually by each manufacturer. The preference seems to be based mainly on the flavor of the coating rather than on the handling qualities of the chocolate. This indicates that the manufacturers are being guided by the preference of the consumer in choosing their coating, and not to such a great extent by their own convenience in making. This attitude augurs well for the continued popularity of these bars.

Question No. 4.—Volume of sales weekly (dozen).

Reports here varied from 15 dozen a week in an Indiana town of 4900 population, to a high mark of 16,000 dozen a week in an eastern city of 733,000. There is a great difference in the volume of sales, based upon the location of the factory and the territory supplied. An approximate average, gathered from the figures we have received, would seem to be 80 dozen a week for each 1,000 population.

Among these replies is one of especial interest from an ice cream manufacturer in Norfolk, Virginia. He gives as his figures 6,000 dozen a week, as his sales in this city of about 116,000, and 10,000 dozen a week as the total sales in the town. Thinking that he had overlooked the word "dozen" in parentheses, and had given us his sales in round numbers, we wrote him to advise us on this point. His answer came back "pronto", stating firmly, decisively and, we trust, proudly, that those figures, insofar as he was concerned, were approximately correct, and that theirs was a **regular** town and business. If the sales of chocolate covered ice cream bars may be

Pasteurize in Glass!

The mixing and pasteurizing of ice cream mix in Glass Lined Tanks has become an established practice. At first, only the larger concerns adopted the system, but gradually as its merits (sanitary, economical, and otherwise) were recognized, it became universal.

Among others, the following ice cream companies have adopted Pfaudler Glass Lined Equipment for mixing, pasteurizing, and aging:

Tait Bros., Springfield and Worcester, Mass.
Horton Ice Cream Co., New York City and Brooklyn, N. Y.
General Necessities Co., Detroit, Mich.
Furnas Ice Cream Co., Akron, O.
Hagemeister Products Co., Green Bay, Wis.
Ottawa Dairy, Ltd., Ottawa, Can.
Bartholomay Co., Inc., Rochester, N. Y.
The Velvet Ice Cream Co., El Paso, Texas
Imperial Ice Cream Co., Clarksburg, W. Va.
Miller Creamery Co., Oakland, Cal.
Ellamore Candy Co., Marysville, Calif.
The Carroll Co., Chicago, Ill.
Kosmos Ice Cream Co., Englewood, Ill.
Nicodemus Ice Cream Co., Frederick, Md.
Totham & Ham, Winthrop, Mass.
C. A. Connor Ice Cream Co., Ovid and Owosso, Mich.
Norwich Ice Cream Co., Norwich, N. Y.
Caum's Ice Cream Co., Altoona, Pa.
R. E. Rakestraw, Mechanicsburg, Pa.
Grove Bros., Waynesboro, Pa.
United Food Products Co., Houston, Texas
Holland Creameries, Ltd., Winnipeg, Man., Can.
Western Dairy & Ice Cream Co., St. Joseph, Mo.
New Haven Dairy Co., New Haven and Hartford, Conn.
Wheat's Ice Cream Co., Buffalo, N.Y. (Akron and Elba plants)
St. Louis Dairy Co., St. Louis, Mo.
Pipestone Ice Cream Co., Pipestone, Minn.
Tech Food Products Co., Pittsburgh, Pa.
Paramount Ice Cream Co., Richmond, W. Va.
Chism Ice Cream Co., Reno, Nevada
Smith Bros. Co., Jackson, Tenn.
National Ice Cream Co., Oakland, Cal.
National Ice Cream Co., San Francisco, Cal.
Excelsior Creamery Co., Santa Ana, Cal.
Trout Brook Ice Cream Co., Hartford, Conn.
Lawrence Ice Cream Co., Chicago, Ill.
Hammond Dairy Co., Akron, Ind.
New Orleans Ice Cream Co., New Orleans, La.
City Dairies, St. Louis, Mo.
H. P. Hood & Sons, Cambridge, Mass.
Consumers Ice & Creamery Co., Detroit, Mich.

used as a criterion, it certainly is. It might be interesting to know what persuasive words are used in pushing the sales of these bars in this city, that warble so winningly to the wallets of the town. This surely is an unusually fine record, to which he may well point with pride. It must be remembered, however, that this city enjoys an unusually great amount of transient trade. Still, if the manufacture and sale of these bars were not in the hands of wide-awake, live wire manufacturers and dealers, sales could not reach this high mark regardless of how favorable the conditions.

Question No. 5.—What method or equipment do you use for cutting?

Out of the 92 who gave replies to this question, 70 used the method of cutting by hand with a knife, most of them using a marker of some kind first, and 12 use a machine. Most of them do not state just what kind of a device it is. The Thomsen Ice Cream Company, of St. Joseph, Missouri, informs us that they made a contrivance of their own for this process, which consists of a 14-inch board with a wire running the entire distance, with small wires attached. One man cuts, dips and removes from the small wires, while another wraps. These two can just keep abreast of each other working in this way. They say that the main difficulty by this method lies in getting the chocolate to the right consistency.

Another firm at Wytheville, Virginia, states that they have a special design which is built on the order of a hydraulic butter cutter, and cuts a brick of cream with one operation. Still another design which cuts a brick at one operation has a capacity of 120 gallons an hour. One firm uses a foot lever cutter, which cuts a brick into 16 bars with one operation. There are also several New Era machines in use.

It would seem that there is a good field for the use of some small, efficient cutter that will take care of the needs of the smaller manufacturer satisfactorily, and that can be made at small expense. There were a few inquiries as to what was offered for this purpose. At present the hand method seems to take care of the requirements of the small manufacturer, with a more or less reasonable degree of satisfaction, and would seem that many of them are waiting until this business passes the experimental stage and is on what they think is a more stable basis before investing in mechanical equipment.

Question 6.—What method or equipment is used for dipping?

Of the 90 replies received to this question, 78 used the hand method, using some kind of hooks for the dipping process.

One firm reports the use of hooks made from bicycle spokes. We suggest a raid of the attic for the manufacturer who wants to cut down on manufacturing expense in dipping. Almost any respectable attic can boast of at least one old bike in some state of delapidation, the spokes of which could be shined up and made to serve for this purpose. (Manufacturers of rust remover please note.)

The method in general favor is to use a pan of some kind, usually steam jacketed or heated, to contain the chocolate, into which the bars are dipped by means of the hooks. Several firms use dipping frames which dip eight or more at one time.

A company at Marion, Indiana, has a contrivance consisting of three rings suspended on a wire running lengthwise of the dipping table, with 11 hooks suspended from each ring. We presume that the 11 bars are dipped at one operation by means of this contrivance.

The aforementioned Norfolk, Virginia, concern reports the use of a cam acting, positive motion dipping machine which automatically feeds and releases itself thereby saving the work of five men. Judging by their output, this is a very efficient means of dipping.

Various patented dipping racks are in use, which dip from 8 to 32 bars at one operation. A few firms also report the use of chain conveyors for use in hardening and dripping.

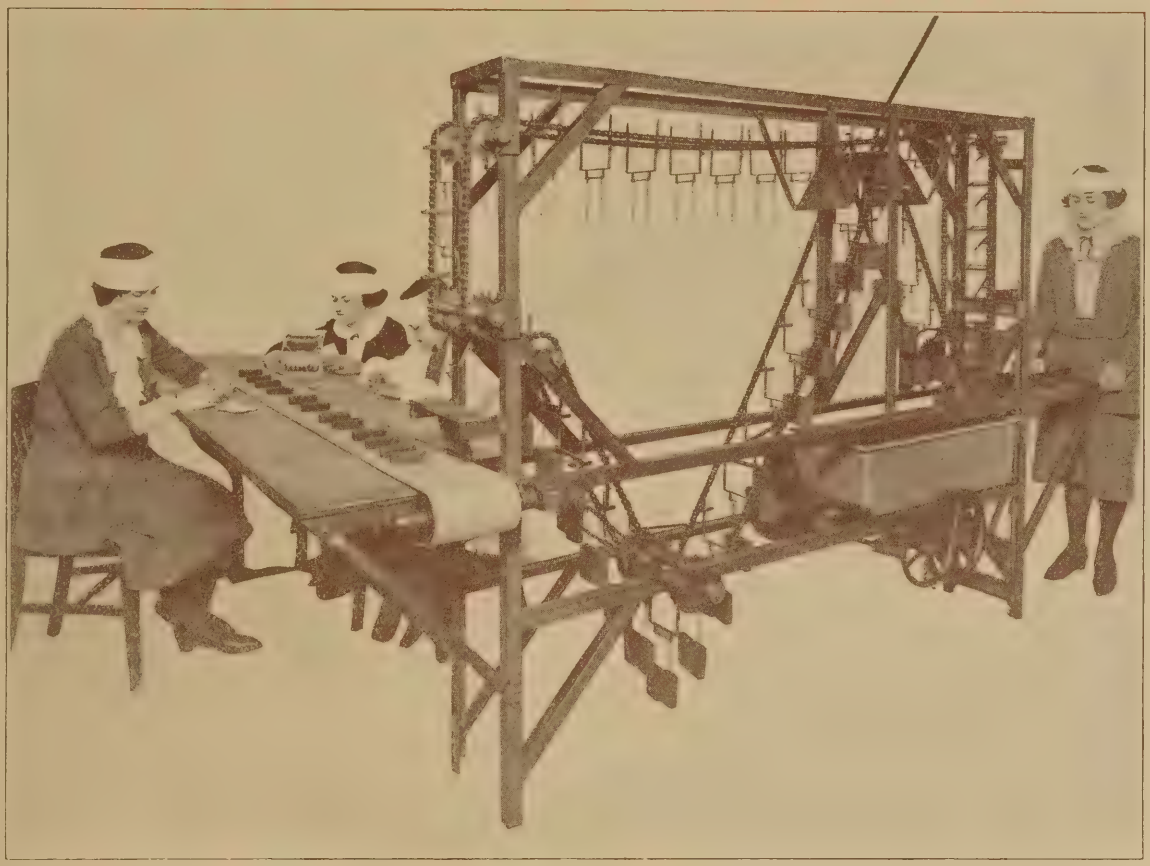
Here too, as in cutting, the mechanical problem seems to be to manufacture some device that will take care of the needs of the smaller manufacturer satisfactorily, and can be placed on the market at a reasonable figure. And as in the case of the previous question, though some manufacturers have inquired regarding what mechanical contrivances are offered for this process, we gather that they are waiting to see what the future of the chocolate covered ice cream bar will be before making any extensive investment in equipment. In larger firms, where the volume justifies, large mechanical dipping devices are in use which are operated in the manner of chocolate enrolers in use in candy factories.

Question No. 7.—What method do you use for wrapping?

There seems to be very few mechanical contrivances invented to wrap these bars, for every firm which answered this question wrapped by hand.

Foil wrappers were used in almost all instances. One firm reports the use of wrappers made of glassine paper printed in colors, which they said made a very attractive wrapper on account of the transparency of the paper and the color scheme used in printing.

Question No. 8—Are sales keeping up satisfactorily?



Answers to this question were very nearly evenly divided, with 45 replying in the negative and 37 in the affirmative. Some report fluctuation depending upon weather conditions. Others state that sales are up to their expectations, but do not say whether these expectations anticipated an increase or decrease. Some manufacturers find that sales reached a high mark in January, decreased considerably in February, but showed evidences of picking up again in March.

The wide divergence of opinions stated in the replies to this question seemingly cover every possible reason there might be for a falling off in the sales of this product. One general opinion was that sales were abnormally high at first on account of the novelty of the thing and that since this novelty has in a measure worn off sales have dropped in proportion. Another reason given by quite a few manufacturers was that many people did not think they were getting full value for their money at the present price of these bars, especially as compared to cones.

One Indiana firm stated that, due to the keen competition offered by the chocolate covered ice cream bars the candy companies of that city were co-operating in putting on an intensive advertising campaign, in which they make capital of the fact that their various chocolate covered bars are larger for the money, and really give more value. This campaign is said to be so extensive and effective as to tend to decrease the sales in the entire ice cream business. It would seem that the thing to do would be to retaliate with a similar campaign boosting the ice cream bars, if they want to keep up the volume of sales. There are any number of forceful selling points in favor of ice cream that would be effective ammunition in such a campaign.

A manufacturer at Fremont, Nebraska, gives as a reason that dealers are losing interest because the man

ICE CREAM PIE MACHINE COMPANY

390 WEST 7th AVE. COLUMBUS, OHIO

gin of profit is too small, especially where express charges have to be paid, and the bars re-iced. Dealers seem to have trouble in keeping the bars frozen to the right consistency, and the fact that so many of them are sold in a soft, sloppy condition tends to decrease their sales, according to reports. In many instances these bars are sold in pool halls and stores where there are no adequate facilities for keeping the bars properly frozen, and this tends to place the bars in disfavor with the consumer.

One firm gives as a reason the abatement of interest on the part of the public, due to the fact that these bars are insufficiently advertised. Unfortunately, this would seem to be true. A product of this kind, the merits of which can be set forth in few words, offers attractive possibilities for clever advertising, and it is to be wondered at that this phase of the business has not been developed to a greater extent. There would seem to be an especially attractive field for billboard advertising, with the use of clever, novel illustrations, effective colors, and catchy, brief phrases or "slogans".

A manufacturer in Topeka, Kansas, who attended an ice cream meeting in Wichita recently makes the statement that the dealers are against the proposition because the public refuses to pay the equivalent of $7.20 a gallon for ice cream, according to a consensus of opinion arrived at there.

Several manufacturers state that, though business has fallen off some from the high level that had been reached at first, it is a condition that could be expected with any novelty, and that the bar is now getting down to a regular merchandise basis. They believe that the bar has sufficient merit to make it reasonable to expect that it will be a permanent addition to the ice cream industry.

In some instances, the general financial condition of the country is blamed for the falling off in sales. It seems that the novelty of the thing caused people to buy it at first who would not continue to do so, and the class of people to whom this bar would make a special appeal are not in a position at this time to give proper support to the industry.

A California concern states that, although their volume of sales had decreased, it was largely due to the unfavorable weather conditions and the prevalence of flu in that part of the country. We print this because we suppose it is the first time in the history of this country that a native Californian has made a statement derogatory to the climate of that country.

However, the main causes for the decline of sales which we gather from summarizing these reports, may be stated in the words of a manufacturer at Decatur, Illinois, who sums up the situation briefly and tersely thus: Restricted territory; too many making them; lack of proper advertising; novelty has worn off; money too scarce for class of trade buying them.

Question No. 10.—What are the prospects for summer season for this product?

"That's what we are trying to find someone else to tell us," says a Columbus, Ohio, manufacturer. We hope that he will find an answer to his question among the great and interesting variety of answers given.

Opinions of those who gave answers to this question were almost equally divided, with a slight majority anticipating a decrease in the sale of the bar for the summer season.

Those who anticipate an increase during the summer give as their main reason that, though regular trade will fall off, the sales at picnics, fairs, ball games, resorts, and other outdoor gatherings where it would be inconvenient to serve ice cream in other ways, will bring the total sales well up over the winter mark. One manufacturer thinks that the general financial condition of the country will be better as the season advances, which will naturally result in an increased sale of ice cream in general, of which these bars will receive a good portion. One California manufacturer says that the prospect looks very good to him, for his firm learns from their dealers that the trade prefers them to cones or individual bricks. A Buffalo firm makes the optimistic statement that they would consider an estimate of double the business in summer conservative.

Manufacturers and dealers consider that warmer weather will bring a natural increase in the demand for ice cream in general. The fact that the per capita consumption of these bars runs just a little higher in the south than in the northern sections of the country would also seem to indicate that the warmer weather would bring an increased demand for these bars.

On the other hand, manufacturers base their reasons for anticipating a decrease in the sales on a number of what appear to be good and sufficient reasons that will come with the warmer weather.

The main objection seems to center around the dealer. It is generally stated that the dealer's enthusiasm for this bar is waning, due to the fact that his margin or profit is comparatively small, and the bars are difficult to keep in a properly frozen condition. Much trouble and expense is encountered in icing these bars so that they will not soften, and he is the one who has to bear the brunt of all complaints put forth by the consumer. Naturally, summer will multiply his difficulties, with the result that he will feel that he is not getting enough out of the transaction to pay him for handling them. Small towns have been large consumers of these bars during the winter, and in most of these places the ice supply is a problem in summer, hence it is reasonable to expect that a great many small town dealers will discontinue handling them. A remedy suggested by one manufacturer is to conduct a campaign to the retail stores by all manufacturers on the proper care of the ice cream bars.

A prominent manufacturer of Louisville, Kentucky, out of the depths of his mental bepuzzlement on the subject, gives vent to the following feeling phrases: "Brother, you sure have asked a real question, and I wish I could answer it. We can only wait and see. The public will accept them in large quantities in the summer, but the question is, can the ice cream be kept in good salable condition?" In making this statement, he no doubt voices the sentiments of a great number of manufacturers.

The smaller manufacturers who do all their work by hand are in favor of discontinuing the manufacture of these bars in the summer because it will be too difficult to make them during the warm weather, and to keep the chocolate from melting after they are dipped.

One man states that if a machine can be devised to cut, dip and wrap these bars, reducing the labor and expense of manufacture so that they can be sold at 5c each, the prospect for a boomnig summer business is good, otherwise doubtful.

Some manufacturers also anticipate a decrease in sales because the dealer is unable to see the condition of the goods and consequently will feel that he is taking a chance his profits do not warrant in laying in a supply.

A manufacturer at Muncie, Indiana, says on this subject that he anticipates good sales for fairs, picnics, baseball games and outings generally, but does not believe the bars will be carried extensively by regular fountains and ice cream parlors. Another agrees with him, stating that for certain carnival events he believes the bars will go big, but for the day to day city sales

Troubled with Competition?

With your present equipment fitted up with the inexpensive H-C Bulk Package system you at once have an advantage over your competitors in securing dealer distribution.

You can easily convince the dealer that it will pay him to handle YOUR ice cream by the H. C. system, because he sells exactly the amount he buys. He has no shrinkage and saves the time of his help required for dipping.

YOU profit in dealer satisfaction, greater distribution of your product and a price sufficient to cover extra small cost and yet secure a larger dependable margin for the dealer.

Learn About the H-C Bulk Package System

Write today for full details on how this system works out and be prepared with a greater number of dealers when the rush season comes.

A Handy Package for Eskimo Pie

This round container holds one dozen Eskimo Bars standing on end and fits into the H-C Bulk Package System without waste of space or confusion and keeps the product in excellent condition.

Coshocton - Ohio

he does not believe it will show the percentage of increase normally expected on brick and bulk business.

As we see it, the main objection to selling the bars in summer is on account of the difficulty of keeping them in a good condition. The others seem to be covered by the condition of trade in general throughout the country.

Question No. 11—Have sales for coated ice cream bars reduced demand for brick?

Of 108 answers to this question, 21 found that the sale of these bars reduced the demand for brick, 82 found that they did not and 5 found that they increased the sales 25 to 33 1-3 per cent, one of them as much as 100 per cent.

One manufacturer states that he feels that the interference with the sale of brick is negligible, because brick is generally served in homes for dessert, whereas the bars are eaten by the "kidlets" in place of candy. This same man is of the opinion that the sale of ice cream in general has been boosted by placing these bars on the market, because of the many retailers who did not handle ice cream at all before on account of improper facilities for service, are selling the coated bars now.

Question No. 12—If so, what percentage?

The 21 manufacturers who found that their sales decresead gave figures which averaged about 25 per cent, with a decrease of 50 per cent for a high mark, and 5 per cent as a low level. One manufacturer stated that he thought it decreased all ice cream sales, taking the attitude that those who buy the chocolate coated bars would have purchased ice cream in some other form if they had not been on the market, and since the quantity of ice cream he gets for his money if less than in any other form, the total quantity of ice cream sold naturally decreases.

Question No. 13—Do retailers welcome this business?

Of 105 replies received to this question, only 19 were in the negative. The main reason given for stating that they did not welcome the trade was because the bars were very troublesome to handle and keep frozen to the proper consistency. Dealers seem to feel that there is not sufficint profit in the business to make it worth while for them to take this trouble. A few did not handle the bars at all. Some preferred not to, but because of public demand for them, they felt that they would lose other fountain trade if they did not.

Then too, since the novelty has worn off the volume of sales has decreased to an extent where profits on this commodity are not up to their expectations, and as a result their enthusiasm is waning. Some retailers feel that the sale of chocolate coated ice cream bars will lessen the sales of bulk and brick ice cream, hence feel that they will lose in the long run by handling them. They claim that the profit on a gallon is only slightly in advance of what it is on brick, and so much more equipment in the way of icing supplies, etc., is needed that this profit is largely swallowed up by it.

"Not very lovingly," says a Wisconsin manufacturer. We were not aware that sentiment entered into the business at all, being under the impression that it was a cold business proposition, the colder the better.

However, in the face of the big odds against them, those who do not welcome this business seem to be the exception instead of the rule. One manufacturer located in Maryland states that the dealers in his district are delighted with them. Another firm in Minnesota makes the statement that their regular dealers are all delighted with the additional business brought them, and they, too, find that many places that did not sell ice cream at all before are selling these bars now, with good success. A few manufacturers agreed that the business is welcomed in territories where it means a greater volume of business but the small town dealer is not so enthusiastic, because it means another tub to pack, and ice is high and scarce, especially in the summer time.

Some manufacturers say that their dealers feel that they are not getting enough profit from them, but in this connection, one man says that the volume of sales takes care of what may be lacking in percentage of profit, but that most dealers refuse to see it this way.

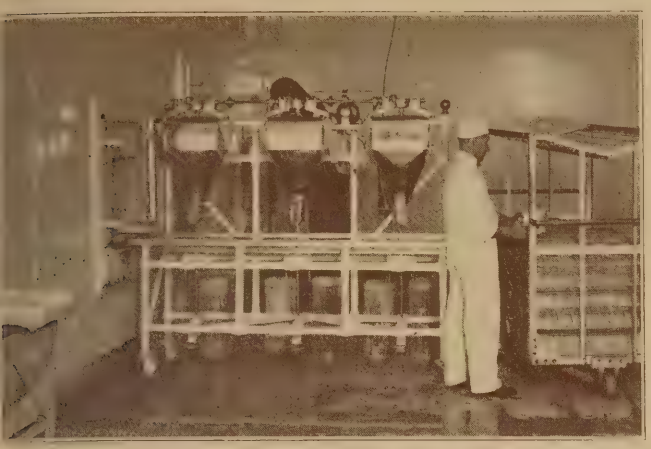
Another philosophical individual, resigned to the general cussedness of human nature, is not surprised at the complaints of his dealers, as he says there are always some who will complain, no matter what happens.

One manufacturer states that he has found that the bars reduce the sale of both brick and bulk 10 to 15 per cent, but in his opinion a fair estimate was almost impossible because of unusual business conditions prevailing just now.

The main objection on the part of the dealers apparently is based on the difficulty of keeping the bars in a properly frozen condition. This again would seem to emphasize the fact that some equipment for keeping these bars more satisfactorily and easily should be devised.

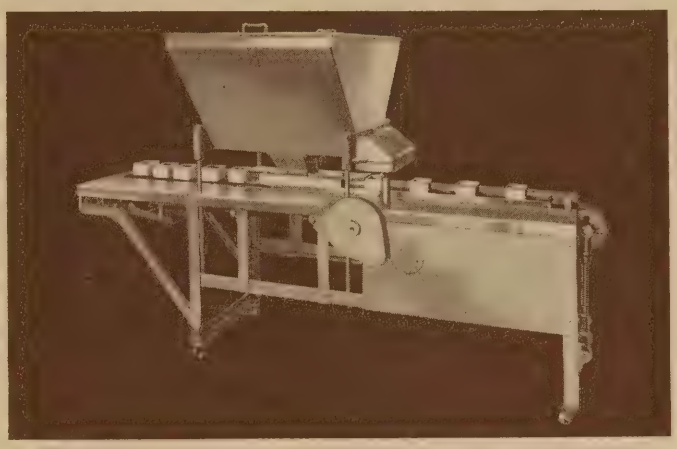
Question No. 14—Do you find it a satisfactory profit producer?

Twenty-five per cent of the replies to this question were in the affirmative, although many of these affirmative answers were qualified in one way or another.



Those who replied in the negative gave a variety of apparently good reasons for their statement. A manufacturer of Wytheville, Virginia, says in this connection that it makes necessary more labor more equipment and more investment in supplies, while it only slightly increases the profit on a single gallon of ice cream. Another manufacturer located in Minnesota states that he does not find it satisfactorily profitable at the present time because things are not on an economical basis. We presume he refers to manufacturing methods. Many of them say that the margin of profit at 80c a dozen is too small to put the business on a profitable basis, considering the additional investment in labor and supplies required. Another phase that was brought to light was the fact that more service on the part of the manufacturer was required in proportion to the amount of profit than with any other form of ice cream, mentioning in particular delivery and icing expense. A few manufacturers agreed that they were too expensive to make in a small way, and were profitable only where the volume ran over 1,000 dozen a day.

Those who replied in the affirmative in a great many cases made the qualifying statement that they found it profitable only because of the large volume, and doubted whether it would pay on a small scale. A number also agreed that it is profitable in winter because it enables them to utilize idle equipment and reduce overhead expense during the winter, but doubted whether it would pay as well in summer because of the extra equipment required. "It helps us to keep our forces during the dull months, and cuts down our losses in the winter season," says a Kansas City, Kansas, manufacturer.



A few manufacturers were of the opinion that the profit was equivalent to bulk, but not as much as on brick.

"We can cut 16 pies to the quart, and dip 22 to 24 pies to a pound of coating, thus making more money than we do on the brick," says a California manufactur-

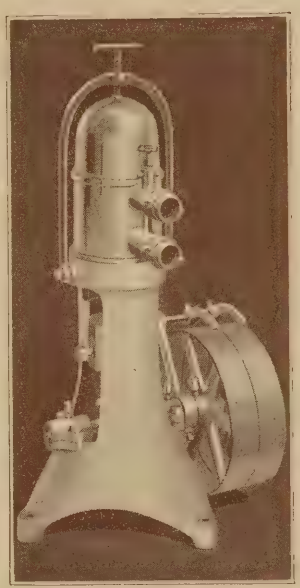
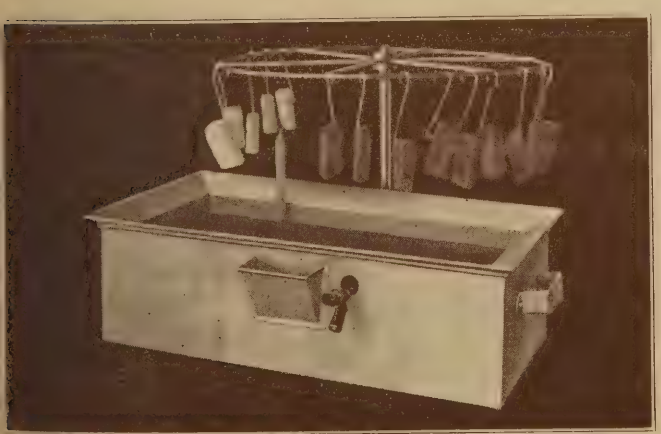
Myers & Burt Slab Filler.

Valerius Brick Carton Filler.



Progress Milk Pump



AS NEW and improved equipment is needed the Davis-Watkins organization is right on its toes in looking out for the interest of customers. Here is a carton filler, slab filler, tub icer and eskimo pie outfit for the ice cream men. All this equipment is the latest and best for each operation. Expert dairy engineering skill is continually promoting, improving and building; the benefits of which are of vital interest to Davis-Watkins customers.

Myers & Burt developed the Slab Filler and the Tub Icer, out on the Pacific Coast. Mr. T. L. Valerius is responsible for the Carton Filler and the Pie Outfit. All four machines are important to ice cream men. They cut handling costs; quickly earning back their cost. Present owners are beginning to wonder how they were able to get along without them.

The Davis-Watkins Dairymen's Mfg. Co. has sales offices in many cities. They are recorded at the bottom of this page for your convenience in making inquiry as to the machines and equipment you are interested in. A live, wide-awake manager is in charge. Just phone, wire or write him—he is put there to serve the men in this industry, who are in need of Davis-Watkins Service.

THE TROUBLE WITH SOME BUSINESS MEN IS THEY ARE NOT SET TO GO.

A CANDY MAN'S VIEW OF THE ICE CREAM BAR INDUSTRY.

Mr. Massarella, of the Liberty Chocolate Machine Company of Cincinnati, is a practical candy man of many years' experience in all its branches. His view of the chocolate coated ice cream bar industry is from the candy man's standpoint.

He says, "It is my belief that the permanency of the chocolate covered ice cream bar industry rests wholly with the manufacturer. The combination of chocolate with the ice cream makes a very tasty and novel confection, the demand for which may be easily maintained.

Almost everyone likes good chocolate, therefore it would tend to increase the demand to use the best, and eliminate the addition of excessive ingredients, thereby producing a more palatable bar. Comments from the public have led me to believe that a quality product of larger size would place the ice cream bar on a staple marketable basis.

"To bring the cost of production to a minimum, the proper equipment is most essential. The coating process is perhaps the most important operation in the manufacture of ice cream bars, hence the problem of coating equipment arises.

"The Liberty Coater, built by the Liberty Chocolate Machine Company, is a well known and practical candy coating machine. It is not a hook, dipping or basket device, but a continuous, automatic coating machine. It has been designed especially to coat ice cream bars. In view of the immense capacity of this machine, and the large savings in coating and labor, a quality product of larger size can be produced at a fair and legitimate margin of profit, thereby helping to insure the permanency of the ice cream bar. Most coatings now used contain excessive amounts of cocoa butter. The Liberty Coater will handle a coating with less cocoa butter very effectively, with absolutely no waste, thereby cutting the first coat, and retaining a palatable bar."

An American in dear old London was bragging about his auto. He ended his eulogy by declaring:

"It runs so smoothly you can't feel it, so quietly that you can't hear it, it has such perfect ignition you can't smell it, and as for speed—boy, you can't see it!"

"But, my word, old dear," interrupted the Briton anxiously, "how do you know the bally thing is there?"
—American Legion Weekly.

BIG SUMMER POPULARITY FORESEEN.

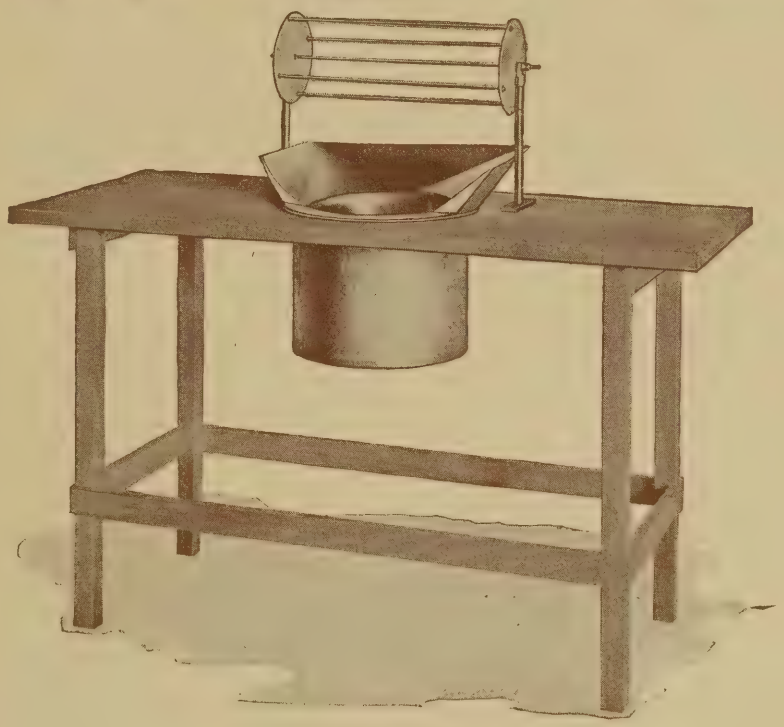
It is the general opinion of the manufacturers that chocolate coated ice cream fills a long felt want in the distribution of ice cream, and that while it has been very popular during the winter, they will be much more popular in the summer.

The simple method of hand dipping in a bath which is water-jacketed or electrically heated, is employed by most of our manufacturers. These bars furnished an outlet for a large amount of ice cream during the winter and have proven their value to the industry. I wish to emphasize but one point in connection with their manufacture and sale during hot weather. Manufacturers and dealers must keep them **cold.** They must be treated with the same consideration in so far as refrigeration is concerned, as brick ice cream; and when they are sold to consumers for later consumption, the consumer should be cautioned against exposing them to warm air for very long. COLD, HARD, FROZEN ice cream bars will sell well and be relished in the summer time; but the industry will be injured seriously, if manufacturers and dealers do not handle them in such way that the centers REMAIN HARD. Customers will be disappointed and ultimately refuse to buy ice cream bars, if the centers are soft. We all expect a big business in chocolate coated ice cream bars during the coming summer.

L. E. HURTZ,
President Nebraska Ice Cream Mfrs. Association.

NEW COUNTER CABINET.

A new type of cabinet for holding chocolate coated ice cream has been designed by the Virginia Tub Company of Bristol, Virginia. This cabinet is a small affair for use on a counter or fountain, and weighs approximately 75 pounds. It will hold eight dozen bars, and it is claimed that it will keep the chocolate coated cream in a perfect condition for 36 hours, with only one icing.



One of the best, most distinctive innovations presented in this cabinet is the self advertising feature.

This feature will give the cabinet the advantage of being a trade stimulator in addition to a counter cabinet, at the cost of one article alone.

This cabinet has been patented as a self advertising counter cabinet for dispensing individual portions of ice cream, and will retail at a very moderate figure.

PROSPECTS GOOD FOR SUMMER BUSINESS.

I presume that our experience has been similar to that of most manufacturers with chocolate coated ice cream. The sale started out very big, continued so for a while and then gradually dropped back to a basis whereby, though our sales were considerably smaller than when this new product was first introduced, they are still very satisfactory and profitable. It is our belief that the chocolate coated ice cream bar has come to stay and that it will be sold in the summer as well as in the winter, and also that it will be a valuable adjunct to the ice cream business.

About the only thing we have done, in reference to manufacturing, that is different from the methods of most of the other manufacturers, is to make a shallow pan just the thickness of the slice used in the bar, this pan being about 12x15 inches and containing the ice cream for five dozen bars. After this is hardened, the cream is removed and immediately dipped, eliminating the drawback of having to put the cream back into the chest after cutting, which was recommended to us at the outset, and which we did for a time but which required a great deal of labor and refrigerating space. We find that by getting these thin slabs very hard they can be cut immediately after being removed from the pan and that it is not necessary to return them to the hardening chest before dipping.

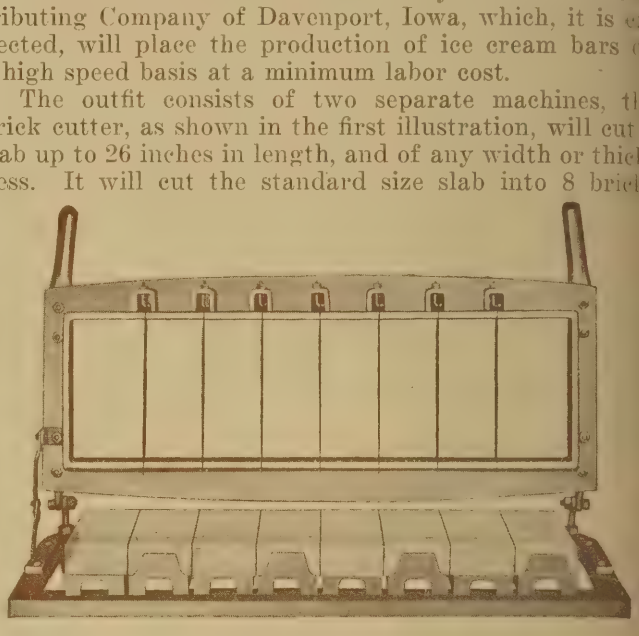
As stated above, we believe that chocolate coated ice cream will hold a place in ice cream sales throughout the summer months that will be considerable, and as our salesmen are seeing the trade at the present time, they are trying to impress upon our dealers the necessity for continuing window and fountain advertising on these bars, keeping the goods in perfect condition and being in a position to supply the demand when the summer weather arrives. At the present time we are supplying 27 Liggett drug stores throughout New England and 70 in New York City, making the majority of these shipments by express. The experience this large chain of drug stores has had with chocolate coated ice cream bars is that when a warm day arrives their sales have been considerably greater than with normal Spring weather and it is their belief as well as ours that warm weather is going to have a considerable effect on the sale of these bars as well as upon ice cream sales, though not in the same proportion. We are going to devote some of our advertising to chocolate coated ice cream and believe that with co-operation on the part of our dealers, this delicious confection can be made a profitable addition to the ice cream business throughout the twelve months in the year

G. W. KENISON,
Treasurer Jersey Ice Cream Co., and President New England Association of Ice Cream Manufacturers.

FUTURE RESTS WITH MANUFACTURER.

(Concluded from page IV)

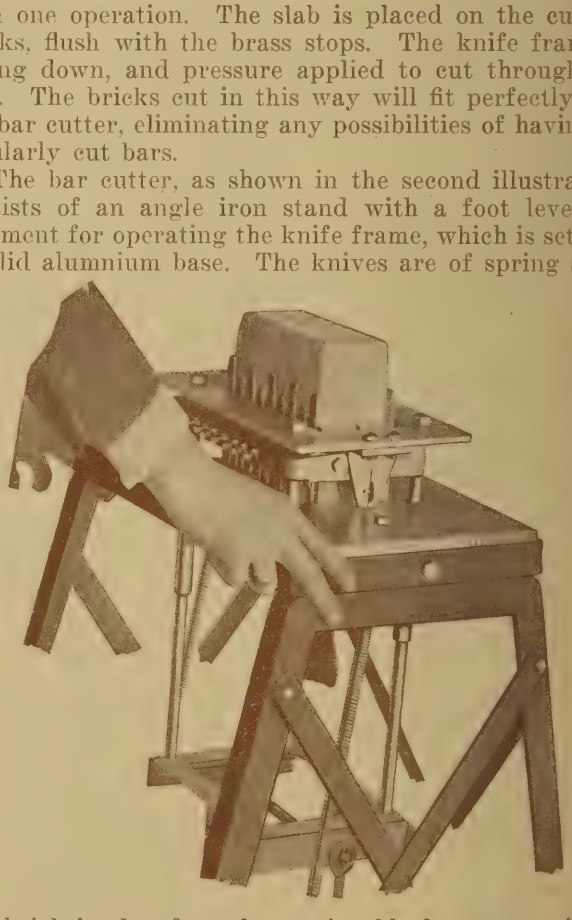
with chocolate," "How delicious they are," "I am going to serve them at my next party," and so on. It certainly paid them to advertise. They had to put four more girls in the Polar Bar department the following week after the above stunt. This all goes to show that the wide-awake ice cream manufacturer himself has the future of this confection in his own hands, as Mr. Glitsch and Mr. Auer, of the New State, says. Hustling always wins.



Yours with a boost,

C. R. HAUK.

CUTTING MACHINE FOR ICE CREAM BARS.



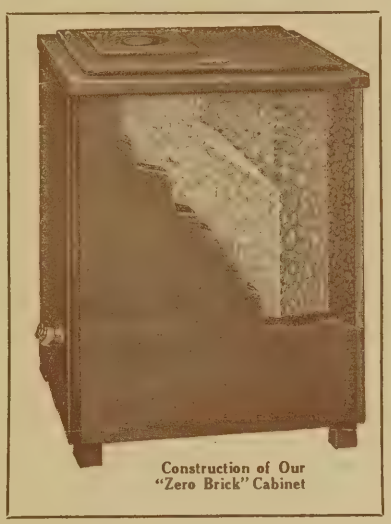
A machine has been introduced by the Central Distributing Company of Davenport, Iowa, which, it is expected, will place the production of ice cream bars on a high speed basis at a minimum labor cost.

The outfit consists of two separate machines, the brick cutter, as shown in the first illustration, will cut a slab up to 26 inches in length, and of any width or thickness. It will cut the standard size slab into 8 bricks

with one operation. The slab is placed on the cutting blocks, flush with the brass stops. The knife frame is swung down, and pressure applied to cut through the slab. The bricks cut in this way will fit perfectly into the bar cutter, eliminating any possibilities of having irregularly cut bars.

The bar cutter, as shown in the second illustration, consists of an angle iron stand with a foot lever attachment for operating the knife frame, which is set into a solid alumnium base. The knives are of spring steel.

The brick is placed on the cutting block, pressure is applied to the foot lever, and the stroke is transmitted to the knife frame. The brick is thus cut into 16 or 18 perfect bars, as desired.



Aluminum construction and the use of brass fittings eliminates possibilities of rust. The machines are sanitary, and are readily cleaned by drenching in hot water.

Planth using these machines are cutting 288 bars a minute, which enables them to cut in 20 minutes as many bars as it would take about two hours and forty minutes to cut by hand with a knife.

The Grand Rapids
ICE CREAM CABINET OF QUALITY

For Keeping Eskimo Pie in Perfect Condition

The Grand Rapids

Construction of Our "Zero Brick" Cabinet

Zero Brick Cabinet

Eskimo Pie, the new confection, which is meeting with such great success, must be kept in perfect condition to insure maximum sales.

Our Zero Brick Cabinet is ideally fitted for this purpose. The design is widely different from ordinary brick cabinets, one of the principal features being the separate covers for the Brick Tank and the Icing Compartment. The tank is held perfectly rigid—no floating. There is no chance of getting ice and salt into the brick compartment while icing.

The high efficiency of the cork-board insulation and construction means a constant low temperature and a minimum ice bill.

More Than a Vision

OUR artist has attempted to portray the experience of the ice cream manufacturer who has consistently advertised good chocolate coated ice cream, as well as the manufacturer who doesn't believe in progressive methods.

Chocolate coated ice cream has been the sensation of the year in the ice cream business. When it was introduced interest in it spread like wildfire. The demand exceeded the supply everywhere.

The demand continues in some sections while reports from other sections indicate that the novelty has worn off and sales are dropping off. What is the reason?

We believe we can give the answer. In those sections where the demand continues the ice cream manufacturers have backed up quality goods by efficient advertising. They didn't depend upon the novelty feature to make the business a success. As real business men they realized right from the start that they had a good food product—not a novelty—and they used the same means in promoting it that they have used in selling their other ice cream products, i. e., advertising.

The average consumer will buy a novelty through curiosity, but he doesn't buy staples that way. He is influenced by advertising and many ice cream manufacturers have forgotten this in their efforts to sell chocolate coated ice cream. They have depended too much on the novelty feature to build up a steady demand. Some have depended on this so much that they even sacrificed quality. They expected to be able to retire in a short time if the demand continued. But it didn't.

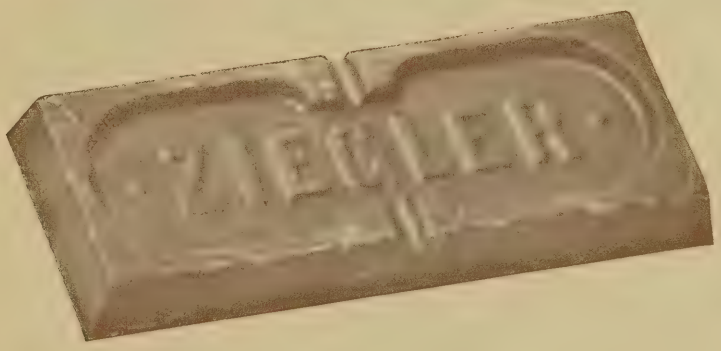
But there is no us crying over spilled milk—or decreased sales of chocolate coated ice cream either. It is just as good eating now as six months ago. In fact, it is better because it is made better. It has merit and the consumer will buy it, but no longer as a novelty. The same measures must be adopted to sell it as are used in selling ather staple goods of merit.

First, it must be made of the finest materials. It must be made right and kept right until passed to the consumer. **Then it must be advertised.**

We believe with those who look upon chocolate coated ice cream business as a valuable and important branch of the ice cream business. It will be just what the men in the business make it, however. We believe that with the right quality and the right kind of advertising a steady demand can be built up.

There are some consumers who complain that a chocolate coated ice cream bar is not worth a dime. How do they know? Who has fixed values? We don't believe any one is competent to say that ten cents is too much for good chocolate coated ice cream. Make the consumer want it badly enough and he will spend a dime for it just as quickly as he will spend a nickel. Surely the business will be in better shape if built up on the basis of a ten cent good article than a cheaper poor one. We believe it would be a big mistake to try to popularize a cheaper product.

We believe in this business so thoroughly that we have devoted this section of The Ice Cream Review to it. Being such a timely subject we feel that our readers will appreciate the effort we have made to put before them some practical information on it.



NEW CATALOGUE OUT.

The new 120 page catalogue, No. IC-2, put up by the Dairymen's Manufacturing and Supply Co., St. Louis, Mo., is now ready for the dairy products manufacturers and can be had for the asking.

It is one of the largest and most complete books the company has ever compiled and will be of interest to the butter, ice cream and cheese manufacturers, and to the milk dealer.

The Dairymen's Manufacturing and Supply Company began business December 1, 1919, and was organized by B. Riley Hauk, who is the president of the company, and a well-known personage for considerable years past in the dairy industry.

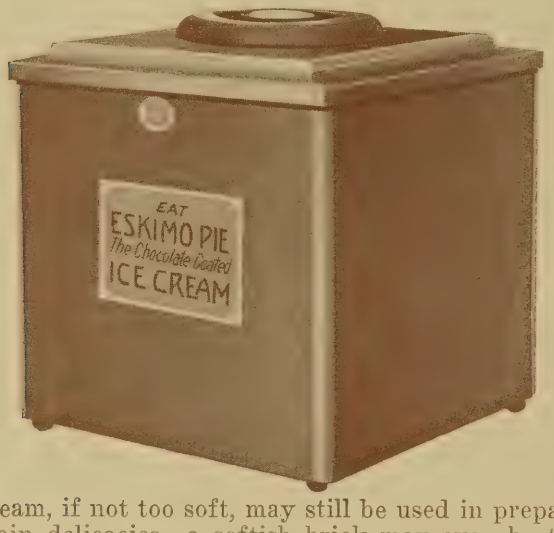
FLORIDA STREET



MILWAUKEE, WISCONSIN
SINCE 1861

A SPECIAL CABINET FOR CHOCOLATE COATED ICE CREAM.

A well known manufacturer of high grade ice cream cabinets, the Stout Crate Co. of Milwaukee, Wis., saw the need, coincident with the sudden widespread acceptance of the chocolate coated ice cream idea by manufacturers, dealers and the public, of immediate steps for insuring that this rather delicate product be properly preserved during the time elapsing between its delivery to the retainer and the moment when the purchaser unwrapped it and took his first bite.

They saw a real danger to the permanent success of this new and very desirable product lurking in the little contingency that if the first bite disclosed a mushy interior with an inclination to ooze out, over and down the edges of the chocolate onto the customer's fingers—then a good customer and booster would be spoiled.

They saw that a conveient, easily handled, thoroughly high class cabinet was more important for the holding of this product at the dealers than even in the case of the customary form of packing ice cream. Soft

ice cream, if not too soft, may still be used in preparing fountain delicacies—a softish brick may even be tolerated for serving at home—but an oozy chocolate coated "mess" in the fingers—never again.

Hence the Stout-Schroeder Perfection Special Cabinet was designed with the idea that it must be neat and attractive enough to be set right on the counter, in full view, where it would be a self seller calling attention to the product and creating the desire to eat one with many who entered the store on other errands, it must be easily moved about, must have plenty of icing space, must hold a generous stock of the packages—and above all it must have the best insulation qualities known to the ice cream cabinet making art.

The special chocolate coated ice cream cabinet is built in strict conformity with the standards of construction that have made Stout-Schroeder perfection ice cream cabinets famous all over the country—that's why they are proving so acceptable to the retailers and are helping to put the chocolate coated ice cream bar on a safe basis of continuing popularity for the future.

No manufacturer who gives the subject consideration will take chances with inadequate "excuses" for cabinets in the stores of his retailers—he will protect his future business by supplying his dealers with the best insulated, most attractive and convenient cabinet he can secure.

One pound of self-reliance is worth a ton of expectation.

GOOD BUSINESS AT AUTO SHOW.

Regarding our present methods, and the selling of chocolate coated cream, we made rather a crude table in which our chocolate was kept warm, this table we are still using. Our bars are dipped in this chocolate bath, and then put on a chain which moves by hand power above the table. Two girls dip, one takes off the hooks, and two wrap. It takes most all of one girl's time to keep the material ready and on hand. We pack 12 bars to a carton, then 10 cartons to a 5 gallon can. We find this very convenient in keeping account, and also very convenient to enable the customer to know that he has received his full amount. Thus far we have not experienced much trouble in keeping them iced up, but are expecting when hot weather comes that it will be much more difficult to keep them frozen hard than ice cream.

Our sales are becoming smaller each week, and we believe that in summer the bars are going to sell best in parks and other places where there are large gatherings. We have just had an automobile show at Indianapolis at which place we had a good business, selling something like 1000 dozen bars.

C. A. REEVE,
Ballard Ice Cream Co., Indianapolis.

MACHINE DEVELOPED TO INCREASE PRODUCTION OF CHOCOLATE COVERED ICE CREAM BARS.

W. D. Belknap, one of the original inventors and promotors of the ice cream cone machine, having noted the remarkable success with which the new chocolate covered ice cream bar was introduced, predicted that it would rank in popularity with the cone, and in order to meet the anticipated demand, realized that it would be necessary to produce this new frozen dainty in tremendous quantities, and on an efficient production basis.

To this end W. D. Belknap, C. R. Belknap and W. Geraughty have perfected an automatic machine with many distinctive features, and original in principle. This machine cuts standard quart bricks into any desired shape automatically, picks each bar up and dips it into chocolate, and when ready to wrap, distributes to the wrappers. There is absolutely no waste of chocolate or ice cream, and it saves labor, floor space and worry.

A picture of this machine is shown in the Ice Cream Pie Machine Co. advertisement, which appears elsewhere in this supplement.

EFFECT OF FOUNTAIN TRADE UNCERTAIN.

The writer would be very willing and agreeable to give you all the information possible about the manufacture and sale of chocolate coated ice cream bars but it is something that has come upon us so suddenly that it it not through the experimental stage as yet. Even what little I could say would not be of any benefit to any one interested in the ice cream business. While this matter has been discussed at our various annual and district meetings, none of our members has posed as a prophet as to just what the future of this business will be.

I can say that every manufacturer of ice cream in Nebraska is making and selling this product and seems to have pretty good sales. What will be the effect on the sales of the new product when the weather gets warm and the retailers open up their fountains no one can predict.

R. W. McGINNIS,
Secretary Nebraska Ice Cream Makers' Credit Ass'n.

The Chocolate Coated Ice Cream Bar Industry in Milwaukee

The Ice Cream Review Representative Visits Big Milwaukee Plants and Gets Dizzy Watching the Manufacture of Huge Quantities of Chocolate Coated Ice Cream Bars.

THE same curiosity that leads a small boy to take his first watch apart to see what its "inwards" look like led a representative of The Ice Cream Review to joyfully accept an assignment by the editor to "cover" the big ice cream plants in Milwaukee and see how they turn out so many and so good chocolate coated ice cream bars. Incidentally he let his enthusiasm lead him too far in sampling the delicacies, and had to resort to well known home remedies, but that is another story. He now knows that there is such a thing as "too much of a good thing."

Our first visit was to the Mansfield Ice Cream Company's plant where we gained much helpful information regarding the chocolate coated ice cream bar, which has become a most popular confection in Milwaukee. Miss Hove kindly consented to show us through the plant and explained the details of manufacture to us.

Beginning with the quart bricks leaving the hardening room, they are brought into the cutting room, which is at the end of the freezer room. In operation there we found the Creamery Package cutter, which automatically cuts the quart bricks into the right size for the coated bars. After these bars are cut, they are again placed in the hardening room. Upon again being withdrawn from the hardening room they are taken to the girls who handle the dipping and wrapping.

The chocolate in its cake form is cut up and melted in large melting pots and then poured in the heated pan in which the bars are dipped. This pan is electrically heated or rather the right temperature is maintained to keep the chocolate the right consistency for dipping.

Individual hooks are used for dipping and holding the bars when placed on racks to dry. A long horizontal bar is placed directly over the melting pot to allow for dripping. The girls start with the empty rack by hanging hooks on the left of this horizontal bar until the bar is completely filled. Then the bars are detached from the hooks and all exposed ice cream is covered with chocolate by a small paddle.

After this is done there is no further operation outside of wrapping. They are first wrapped in a light tissue paper and lastly in tin foil and then packed into boxes of two dozen each. After these bars are all packed, they are again placed in the hardening room to await orders.

* * *

We next received a hearty welcome at the plant of the Bendfeldt Ice Cream Co., 2308 Clybourn Street, by Mr. Bendfeldt, whom we found to be a very busy man. Mr. Bendfeldt had just returned from a trip to California and he turned us over to his brother, Herbert Bendfeldt, who is in charge of the manufacturing end of the business.

The chocolate covered ice cream bar making department of the Bendfeldt plant is located in one end of the freezer room. We found there a number of girls operating a Creamery Package brick cutting machine. Their method is to run the cream direct from the freezer into the ordinary brick molds, filling the moulds only half full or the thickness they intend their chocolate covered ice cream bars to be. After these moulds are hardened in the hardening room, which is held at a temperature of 20 degrees below zero, the moulds are inverted and the hardened cream is forced out of them by means of air pressure. The hardened cream is then placed on the belt and automatically conveyed to the cutter. The machine is set in such a way that it cuts the ice cream into the proper size for the chocolate covered bar, lengthwise and crosswise, getting 16 to the quart. One of the young ladies was taking the cream from the machine after being cut into bars and placing it on another slab on which they were taken to the hardening room for rehardening. After remaining there a sufficient time to harden properly, they were again brought out in the freezer room for dipping.

In the dipping process, an electrically heated water jacketed tank is used. A prepared coating is previously cut up or shaved, melted and heated and is then placed into the tank of the dipping apparatus.

We found the Bendfeldt plant to be a very well equipped plant. The freezer room was equipped with 8 of the Creamery Package 40-quart freezers, most of which are kept in continuous operation. In another room adjoining the freezer room are 4 Creamery Package vats, one of which is used for pasteurizing and mixing and the other three for holding or ageing. From the mixing vat the cream is run to the Gaulin Homogenizer nearby and then over an Arctic cooler and into the three ageing vats before mentioned. On the lower floor are a couple of Creamery Package refrigerating machines, each with a capacity of 60 tons. Each of these machines is run with an individual motor and are connected in such way that either or both of the machines may be used for hardering at one time.

The Bendfeldts are very enthusiastic over the chocolate covered ice cream bar, believing that it will become a permanent source of profit for the ice cream business. They feel that the novelty of the bar is past and that their sales have reached a permanent basis. They expect the demand to increase considerably during the warmer months and expect big sales from the crowds a baseball games, parks and other amusement places.

* * *

A call on the Luick Ice Cream Company revealed to us quite modern appliances and conveniences for the making of coated ice cream bars. They have a separate room, which we judged to be about 35x15 feet, in which the complete process of manufacturing this product is conducted. At one end of the room may be seen the two melting pots for melting the bulk chocolate, each one holding approximately between 15 and 20 gallons of liquid. After thoroughly melting the chocolate, it is then placed in the dipping pan by means of large dippers. These dipping pans in which the chocolate is placed after melting is electrically heated and maintains a temperature of about 90 degrees Fahrenheit, which is the best temperature to maintain to keep the chocolate the right consistncy for dipping.

In the center of this room is a long table, on which the complete operation of dipping, drying and wrapping is all done. There are several heated dipping pans and above each is a 4-bar spindle. The individual bars of ice cream are placed on hooks which are attached to the horizontal rods after being dipped by hand. When this rod is filled to capacity, without overcrowding so that the bars would come in contact with one another, the spindle is turned and the girls on the opposite side unhook the bars and cover all exposed cream with chocolate by the aid of a small paddle. They are then placed on an endless belt, which moves towards the opposite

DO YOU REALIZE THAT GOOD CARTONS WILL INCREASE BRICK SALES?

end of the table, where the girls may be seen wrapping the bars, first in a light tissue paper and lastly by the tin foil and then packing them in boxes of two dozen each. After this operation has been completed, they are again placed in the hardening room and are ready for the trade.

The cutting of these bars is done by a Creamery Package cutting machine, which cuts the regular brick cream into the correct size for the bars. After the cutting, they are replaced in the hardening room preparatory to the dipping process. This hardening room maintains a temperature of at least 10 below zero at all times.

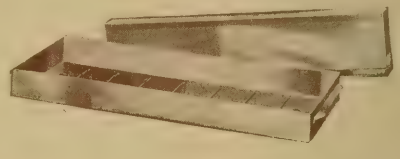
* * *

The Blommer Ice Cream Company's superintendent, Mr. Brandt, kindly consented to show us through their plant recently. The ice cream is run into brick slabs directly from the freezer. These slabs are about 2½ feet long and 8 inches wide, and hold two gallons of cream. The pan after being filled, is levelled off and placed directly into the hardening room, where it is left for at least over night. Upon withdrawing the cream in the morning from the hardening room, these brick slabs are placed in warm water for a few seconds so as to loosen the cream from the container. The cover is then removed and by means of air pressure applied through a small hole in the bottom of the pan, the cream is forced out on to a board. This sliding board that the cream is placed on is a part of the ice cream cutting equipment. The board is so made that there are notches in the under side, which regulates the feeding of the cream through the cutter. This company has a New Era cutter, manufactured by the New Era Company of Oshkosh, Wisconsin. This machine is used extensively among the manufacturers of this product. The size of the bars is adjusted by a notched plate which is located on the feeding end of the cutter, so that bricks of one quart and one pint and other sizes may be all cut on the same machine. The two gallons of cream as it passes to the cutter produces 128 bars.

The chocolate in its cake form is cut and melted in the same process as the other companies, which have been visited. The chocolate is dipped from the melting pots to dipping pans in a similar way as before described and instead of being sustained at a certain temperature, the process is simplified by having a greater number of people doing the dipping. In one day this plant turns out at least 700 dozen of these chocolate coated bars. The one different feature which the Blommer people have in their equipment is in the manner of conveying the ice cream bars, after they are dipped, to the girls who attend to the wrapping. They have a pulley arrangement in the form of a heavy string which travels about 2 feet above the dripping table. The dipped bars run slowly across from the dipping end to the girls who detach the bars and do the wrapping.

The trolley runs slow enough so that the chocolate has plenty of time to harden properly. Different ones have commented upon this one feature of the Blommer Company, as being a better method as it allows for a definite means of drying the chocolate before wrapping.

The wrapping of the bars is done through one operation only. The tin foil and the tissue paper are so arranged that the bar is wrapped with both at the same time, and quickly packed into the two-dozen bar cartons.



The hardening room is at the end of the table where the girls are wrapping these bars and the matter of quickly placing the packages into the hardening room is very simple and quickly done. The Blommer Company has witnessed the same falling off in trade as other companies of Milwaukee have, since the novelty of the bar has worn off.

It has been quite interesting for our representative to see all these different methods of manufacturing this product.

⚜

A BRICK MOLD FOR CHOCOLATE COATED BARS.

The development of the manufacture of chocolate coated ice cream has created the need of a special ice cream mold. To meet this need The Creamery Package Mfg. Company are marketing a heavy steel ice cream brick mold. This is made from heavy black 16 gauge steel plate, welded together and then thoroughly tinned

from pure block tin. Hence it cannot distort, bulge nor get out of shape and all bricks are uniform in shape and size. As there is no solder used except around the handles, the interior of the mold is absolutely smooth and is easily cleaned and sterilized.

This mold is made in two special sizes, i. e., an extra deep mold 26 inches long, 6⅜ inches wide and 2¾ inches deep, holding eight quarts, and a shallow mold 26 inches long, 6⅜ inches wide and 1⅜ inches deep, having a capacity of four quarts. The contents of either mold can be sliced in one operation into bars of standard sizes.

⚜

SUGGESTS A VARIETY IN CENTERS.

Chocolate coated ice cream has become a very popular seller in my territory. I find it is being sold under different names, such as Eskimo Pie, Alaska Bar, Chocolate Patties, Alaska Patties, Velvet Chocolate Bar, Chocolate Coated Bar, Frozen Polar Bar, and many other names too numerous to mention. Will say it helped many ice cream manufacturers to make money last winter. It surely would always make a good winter piece and probably summer piece if the manufacturer will push it during the hot weather.

I have seen it frozen in different flavors and it is a very nice eating piece. I find some flavors in the ice cream are greatly hidden on account of the chocolate flavor and the manufacturers will find ice cream flavored with caramel flavor is a flavor that blends very nice with chocolate. Furthermore, the color of caramel ice cream is like a caramel candy and the color blends very rich with the chocolate. If you put broken red cherries in your ice cream you will have a very nice bar, as the light brown center with red pieces of cherries, dipped in chocolate, make a dandy piece to sell to the trade. The chocolated Caramala ice cream bar was demonstrated the first time for the convention at Saginaw, Michigan, in February, and everyone was pleased with it.

BALL GAME BRINGS GOOD BUSINESS.

We have gone through the peak load of the chocolate bar business with probably the same amount of plant disorganization and night work that all other plants have had. In our section it has increased the sale of bulk ice cream, in addition to the sale of the bars itself.

Not knowing anything about the chocolate candy business we had our trouble with coatings. We have melted coatings at temperatures ranging from 120 to 180 degrees and dipped from 90 degrees up. For the coating we have finally decided to use, we have found that melting at about 120 degrees and dipping at 95 degrees gives us a very satisfactory product. This coating requires about a 10 per cent addition of Cocoa butter to maintain the best dipping consistency. We use a half size slab brick, cutting on a New Era Brick Cutter, dipping in an electric heated chocolate pan. This equipment with three operators makes the cost of labor to cut, dip and wrap slightly over two cents a dozen.

In regard to summer business it is very much guess work to forecast it though we have had one shining example of its possibilities at baseball games, fairs, etc. We had one of the pre-season ball games here March 24th, featuring Ty Cobb and the rest of his team playing against the Rochester, N. Y., Internationals. The attendance was 2300 paid admissions. With the disadvantage of a comparatively cool day we sold about 30 per cent of this number, or 60 dozen, during the game. We were badly handicapped by not being able to get efficient boys, and at one time we were sold out. I believe we could have sold under good conditions 100 dozen, or about 50 per cent of those at the game. Our present sales are about 40 per cent of peak and seem to be holding steady at about that rate. Under the circumstances we are very optimistic on chocolate coated ice cream.

L. A. CORNING,
President Buttercup Ice Cream Co., Hamlet, N. C.

A GOOD THING, BUT NEEDS PUSHING.

Here's to the chocolate coated ice cream bar, the life saver, or winter exhilarator of the ice cream industry! The trade has taken to it just like cooties to the dough-boys. In the opinion of the writer, it is here to stay, and the more pleasantly we treat its interests the more respect we shall acquire for it.

The question in the minds of everyone is—will the sale of the bar continue throughout the summer months, and can the necessary attention be accorded it for a continuance of the present increasing demand, or would it be wiser to anchor it during the summer months in order to stimulate winter business, during which time its manufacture can be handled more advantageously.

Since there is no special make-up to the ice cream end of this bar manufacturing business, and considering the fact that chocolate is an all year round seller in all stores, soda fountains and confectionery shops, one could not but be prompted to believe that the manufacture and sale of the chocolate covered ice cream bar should prove of good financial interest to all concerned. Ice cream manufacturers have now in a measure overtaken a lead as established by the candy manufacturers, who have long considered the importance of pushing bar and package goods. It appeals favorably to the dealer, who appreciates the fact that extra labor in the way of weighing, wrapping, etc., has been eliminated, and it wins the favor of the public, who much prefer to purchase a form of goods of known branding, properly wrapped, with weight, etc., properly shown. Again, such a package is much more attractive, gaining favor from a sales or advertising point of view.

The introduction of chocolate coated ice cream bars has caused some unrest to the candy manufacturers. It has given them something to think about, since it is plain to see that it has reduced the sale of chocolate coated candy goods. The move to which we should all give serious consideration at this time is some action to take towards increasing the demand for the chocolate covered ice cream bars, and to have them recognized by our dealers as a very lucrative sales proposition, with little action involved on their part in the upkeep of the advertising campaign. We should also point out to them the reasons for regarding them highly, not only as a confection of real merit, but as a delicious dainty in the purest form, in which is embodied the nutritive value of a pure food product.

When we jump in our Lizzie for a spin around the old town, we are confronted with the necessity of putting the juice to her to have her climb the hill. At such times we disregard the thought of having the car make the grade alone. Now let's couple the chocolate coated ice cream question with the Ford situation; the popularity of this car was achieved, not only by a mere introduction on the public market, but by an everlasting sales effort to gain favor over the fore-running competition. As in all cases where endurance and perseverance is the predominating factor, the Ford won out in popularity, and so will the chocolate coated ice cream bar.

F. E. ROBINSON,
Mgr. New Orleans Sales Office, United Chemical and Organic Products Company.

SOUTHERNERS, CAN YOU ANSWER THIS QUESTION?

Have just read in your March issue the contribution on the staying power of chocolate coated bars. We surely are considering this question here. We are using the best vanilla cream we know how to make, and covering with the highest grade coating we can find. Our regular cream sales have about doubled in the past eight weeks. Yet our sales have dropped over 50 per cent, and are still on the down curve. From reports we have heard, other concerns in greater Boston are fully as hard hit. I believe the question of "Quality" needs more emphasis as, it seems to me, the entire industry is seriously injured by the poor article sold by some manufacturers.

My object in writing, however, is to ask if you could not push your inquiries further, especially into southern territory, to ascertain how the bars stand the hot weather. I have been told by a salesman that they are selling well in Florida, and are keeping in good shape in that climate. Could you verify this? Personally, I feel that chocolate coated ice cream is here to stay, and as you have said in your article, the individual manufacturer is the big factor in the case, we are putting in new hardening rooms and added machinery on this assumption. If I could get some idea of how the summer climate affects both the sales and the keeping qualities it would help in forecasting our work.

May I add, I appreciate very much the practical articles in your magazines, and such as the exposition on "Determination of Fat in Gelatin" in this March issue. It seems to be hard to get hold of real facts in ice cream work. I suppose because of constantly changing methods and new discoveries. Every new real fact helps, however.

Sincerely,
E. S. TURNER.

ESKIMO PIE

The Eskimo Pie idea included the tin foil wrapping. Nothing else would do.

People have learned to prefer the product wrapped in foil.

For the following reasons:

1. FOIL IS CLEAN
2. FOIL PROTECTS
3. FOIL LOOKS THE PART

There is no better way to wrap chocolate coated ice-cream bars than with foil.

There is no better foil made than Conley foil. Send for samples, prices and designs.

EMERSON MANUFACTURING COMPANY
1701 Madison St., N. E. **Minneapolis, Minn.**

SUCCESS RESULTS FROM BACKBONE, NOT WISHBONE—AND PROPER EQUIPMENT AND METHODS.

A RAPID BRICK MOLD RELEASER.

One of the most pressing problems of the manufacturers of chocolate coated ice cream is the question of turning them out fast enough.

The Luick Ice Cream Brick Mold Releaser is a device that not only will speed up the manufacturing process but it is more convenient and sanitary. The necessity of dipping the mold in a tank or tub of water, which soon becomes unsanitary, is avoided. The releaser delivers the brick from the mold in a solid brick instead of a brick that is mushy on the sides.

No power is required to operate this machine and it is simple of construction. The mold is placed in the machine and receives a spray of cold, clean fresh water which thoroughly washes off the dirt from the outside of the mold. Then every part of the mold is sprayed with hot water. The operator simply turns a whistle valve for one or two seconds prior to releasing the brick. The mold is removed from the machine, turned over on the table and is lifted off, the brick remaining in a true solid shape.

This device is manufactured by The Creamery Package Mfg. Company, Chicago.

MATTOON CREAMERY TO BUILD NEW FACTORY.

Mr. J. W. Kisner of Champaign, Illinois, has purchased the Mattoon creamery, and contracts have been let for the erection of a new building. This will be a one and one-half story brick structure, 130 feet long by 50 feet wide. The basement, extending the entire length of the building, will have a reinforced concrete floor. This building will be located on one of the most prominent streets in Mattoon. It is expected that the cost of construction will be in the neighborhood of $25,000, while an additional $15,000 will be spent for new equipment, including refrigerator systems, ice cream freezers, pumps, vats and boilers, to be installed for the manufacture of butter and ice cream, and the pasteurizing of milk.

A new company will be organized when the building is completed.

THE SUNDAE-ETTE.

Among the various brands or trade marks under which chocolate coated ice cream is manufactured and sold, is the Sundae-Ette. This name was adopted by The Sundae-Ette Company of Milwaukee. It differs somewhat from the other bars in that the ice cream is placed between two chocolate wafers, similar to the Nabisco Wafers and then is dipped in chocolate. It is said to have the advantage of holding its shape, the Nabisco on either side acting as a support for the cream, to prevent the chocolate from cracking over the entire bar when a bite is taken. The Sundae-Ette has appealed to the lovers of this confection and it requires a highly imaginative mind to conceive of anything more dainty or delicious. This confection has enjoyed a great success, not only in the volume of sales but in genuine customer appreciation and popularity.

A high grade wrapper is used, consisting of a foil wrapper, called "Radio".

The address of the Sundae-Ette Company is 377 Florida Street, Milwaukee, Wis.

ARCTIC ICE AND COAL COMPANY PURCHASES NEW PLANT.

The Arctic Ice Cream Company has recently purchased the ice cream plant and good will of the May's Ice Cream Company of Burlington, N. C. They are renovating and remodeling the plant, and just as soon as the new equipment is installed, the factory will be in operation.

The Arctic Ice Cream Company is owned and operated by the Arctic Ice and Coal Company, which is a North Carolina corporation with capital stock of $600,000. The officers of this company are W. C. Boren, president; J. W. Landreth, vice-president, and H. E. Cartlandt, secretary and treasurer, all of Greensboro, N. C. The company also operates plants at Winston-Salem, High Point, Wilmington and Greensboro, N. C.

Mr. J. O. Sharrard, formerly of the National Ice Cream Company, of Louisville, Kentucky, who, as manager of the company's Wilmington plant the past year, has been transferred to Greensboro, and has been made superintendent of the plant at this point.

THE MANUFACTURERS' POINT OF VIEW.

(Continued from page XIV)

er, in direct contradiction to some of the above statements. We do not know whether this man was taking into consideration any additional equipment or labor in making the statement that his profits were satisfactory, but the tone of his entire report was of such an optimistic nature that we presume he must have found his returns pleasing. Up to the present time this factory has been cutting, dipping and wrapping these bars by hand, but have an automatic cutter on order, which they expect to put in operation soon. Their capacity is about 1000 dozen a week.

One point that a number of dealers report as being in favor of the bars is that they are so very easy to sell and serve that practically all expense in this connection is eliminated. Taking this into consideration, one is led to wonder whether this would not counterbalance the expenses involved in re-icing and packing.

Summarizing, the consensus of opinion seems to be that the manufacture of these bars is profitable in winter where the volume of sales is great enough and idle equipment can be used, but that the industry is not yet on a sufficiently economical basis to make it profitable under any and all conditions, and the outlook for the summer is doubtful because it still remains to be seen whether the volume of sales will offset the additional overhead expense that the warm weather will make inevitable.

Question No. 15—Have coated ice cream bars increased total winter gallonage?

Only about one-fourth of those who answered this question found that the bars did not increase their total winter gallonage.

"Not known yet; winter is not over yet," we are gently reminded by a Connecticut factory owner. It's supposed to be over, according to our almanac, brother. We're afraid the Connecticut weather man is having a little joke at your expense.

A California manufacturer says that it is very difficult to make an estimate that approaches accuracy in any degree, because, due to the wet season in that state, business as a whole has been slow. However, he states that 1922 has already shown an increase, and the prospects for the year are excellent.

Several manufacturers make the statement that the total winter gallonage is increased only by the quantity of ice cream used in the manufacture of the bars, and, since there are as a general thing 72 to a gallon, a very great number would have to be sold before there would be a noticeable increase in the gallonage. However, in a factory that would have been practically idle during the winter had it not been for the manufacture of these bars, even a moderate volume of business would be an appreciable increase.

It is quite evident, however, from the proportion and nature of these replies that there has been a good portion of ice cream sold this winter in the form of these bars that otherwise would not have been on the market at all, and, considering general financial conditions, this commodity has played an important part in keeping up the winter consumption of ice cream.

Question No. 16—If so, what percentage over last winter?

Out of the replies received to this question, twenty per cent showed an increase of 10 per cent, 12 per cent showed an increase of 20 per cent and an equal number showed an increase of 25 per cent, four per cent showed an increase of 30 per cent, eight per cent increased 35 per cent, twenty per cent increased 50 per cent, twenty-four per cent increased 100 per cent and four per cent increased 200 per cent.

In one case, of which we make an exception, the manufacturer reported an increase of about 500 per cent. His factory is located in a Georgia city of about 53,000 population, and his weekly capacity is approximately 2000 dozen.

Question No. 17—Have you made any effort to sell coated ice cream bars at cigar stands, grocery stores, and other places where ice cream is not generally sold?

About two-thirds of the manufacturers answering this question had tried selling these bars in places where ice cream is not generally sold, with varying degrees of success. The biggest customers of this class of retailers are cigar stores, bowling alleys and pool rooms, with bowling alleys heading the list, probably due to the fact that the strenuous physical exercise creates a type of appetite that these bars are particularly suited to appease. Because they are easy to serve, they would seem to be the ideal refreshment for places of this kind. Some manufacturers have found these places to be their largest customers. Another place where these bars are sold with a fair degrees of success is in the soft drink emporiums formerly known as saloons. As a general thing, this commodity is not handled with an even satisfactory degree of success by grocery stores, mainly on account of the refrigeration problem. Where cabinets are furnished by the manufacturer, the trouble and expense of keeping them iced is not justified by the moderate volume of business done by these stores.

Question No. 18—If so, with what success?

Opinions expressed in reply to this question range from expressions of enthusiasm from manufacturers who find that these places are their best customers, to indication of indifference to cultivating this class of trade by manufacturers who find that they are rendering packing service at a loss, unless the volume of business is very large.

In fact, from the standpoint of both manufacturer and dealer, the only serious difficulty encountered in selling the chocolate covered bars in places where ice cream had not been sold at all before the introduction of these bars, is the problem of keeping them properly frozen. They feel that, due to the fact that in these places many bars are sold in a soft, sloppy condition, the general popularity of these bars will be detrimentally affected, and will injure the business in the long run.

In this connection, one manufacturer who does not cultivate this class of trade says, "We have entirely too many little dealers of this description handling ice cream in summer, who lose money for all concerned, and we do not wish to encourage them. They would probably increase the total sales somewhat, but where packing is furnished, would do so at a loss."

However, the majority of manufacturers and dealers find this trade to be profitable and successful in spite of these difficulties. It brings the manufacturer business that he otherwise would not have at all, and any trouble or expense on the part of the retailer is largely offset by the negligible expense in actual selling and serving. In only one case did the manufacturer feel that this business was gained at the expense of the regular dealers.

Question No. 19—What is your estimate of the total sales of coated ice cream bars per week in your city (dozen)?

The figures given in reply to this question showed such widely varying proportions that, in order to give a better idea of how the estimated consumption of these

Protect Your Supply of Foil Wrappers

Racine, Wisconsin	58,500	2,000
Sioux City, Iowa	71,200	1,000
Harrisburg, Pennsylvania	75,900	2,000
Tulsa, Oklahoma	72,000	1,000
San Diego, California	74,600	2,800
OVER 100,000.		
Columbus, Ohio	237,000	1,193
Atlanta, Georgia	200,000	13,500
Norfolk, Virginia	115,700	10,000
Bridgeport, Connecticut	143,500	2,000
Kansas City, Kansas	101,000	2,000
Baltimore, Maryland	733,000	12,000
Buffalo, New York	506,700	11,000
Louisville, Kentucky	234,800	1,750
Salt Lake City, Utah	118,100	4,000
Philadelphia, Pennsylvania	1,823,800	60,000
Tacoma, Washington	100,100	1,500
Springfield, Massachusetts	129,600	1,000
Los Angeles, California	576,700	1,500
Milwaukee, Wisconsin	458,000	14,000

The population of the cities named in this list are only approximate, as they are given in round numbers, and are taken from the 1920 census figures.

On the average, it may be noticed that the per capita consumption runs somewhat higher in the southern and eastern sections than in the northern and mid-western, with the western portions of the country about between the two. Even allowing for inaccuracies in estimating the consumption, the difference is so general that it may be taken as a safe indication.

However, taking each section separately, it will be noticed that towns fairly near each other differ greatly in per capita consumption. This seems to signify that, assuming that conditions are equal in both places, in those localities where the consumption runs higher, the demand for these bars has been stimulated more extensively by dealers, manufacturers, or both. This apparently indicates that the field for the sale of these bars is not being pushed in many territories to the extent that it could be, and that the per capita consumption could be increased to a point a great many times higher than it is at the present time.

NATIONAL INDUSTRY TO HAVE ITS OWN GREAT WEEK.

The following announcement has been made by The Association of Ice Cream Supply Men:

"The National Association of Ice Cream Manufacturers has notified this association of the former organization's directors' acceptance of the organized supply men's invitation to hold the 1922 convention of the National Association of Ice Cream Manufacturers in Cleveland, in conjunction with a National Exposition of the ice cream industry.

"In conference with officers of the National Association of Ice Cream Manufacturers the week of October 16th has been picked for a joint Convention-and-Exposition of national scope.

"Its opening date slightly preceding the close of the convention of the National Association of Ice Cream Manufacturers—the dates of which have been set by its proper authorities as October 16th, 17th and 18th. The Association of Ice Cream Supply Men will open its exposition in the $6,000,000 public hall in the heart of Cleveland, the newest, most magnificent and ideally-equipped exposition building in the country. Until the close of the week ending October 21st, this great exposition of machinery, equipment, services and supplies, with added and novel educational features, will be open to the ice cream manufacturers of the United States, Canada and foreign countries.

"The Association of Ice Cream Supply Men is already preparing its campaign, to be effected through its 100 members scattered from coast to coast and through the more than 500 members of its affiliated Salesmen's Club who travel every state and county in the United States and Canada, to make the attendance at the combined Convention-and Exposition, transcend any gathering of the ice cream industry yet recorded.

"The heartiest support and co-operation has been displayed in the preliminary arrangements so far made by the officers of the two organiations. The Association of Ice Cream Supply Men is dedicating its efforts for the next six months to making the week of October 16th to 21st the national industry's own great focussing point of progressive interest and ambition."

CENTROX DAIRY COMPANY ORGANIZED.

Centrox Dairy is the new name applied by H. R. Schultz and Geo. Armstrong to the Douglas ice cream factory, which they recently took over. Mr. Schultz is president and Mr. Armstrong is secretary and treasurer. The company is capitalized at $20,000. It is their intention to remodel the present plant, and equip it for the manufacture of butter as well as ice cream.

NO TROUBLE WITH WAFERS.

In reply to an inquiry regarding the keeping qualities of the wafers used in Sundae-Ettes, we received the following letter from the Secretary of the Waukesha Ice Cream Company:

"We are glad to say that we are having no difficulty in keeping the wafer on our Sundae-Ettes in good condition, provided, of course, that they are properly taken care of, as ice cream in general should be taken care of. We are using a filled wafer with very great success. We have heard that wafers not filled are not giving satisfaction.

I heard only recently from a man who had eaten one of our own make Sundae-Ettes which he was informed the dealer had then had on hand for two weeks, and which he found in good condition. In reality, however, it had been in the retailer's possession for three and a half weeks, and when a wafer can hold up that length of time, it must be pretty good. Nuf sed.

ANTHONY OLINGER,
Secretary Waukesha Ice Cream Co., Waukesha, Wis.

MAKING CHOCOLATE COATED ICE CREAM BARS IN MINNEAPOLIS PLANTS.

Our representative has just had occasion to call at the Ives Ice Cream Co. and the Kemps Ice Cream Co. of Minneapolis where he had the pleasure of seeing a very novel arrangement for the making of chocolate coated ice cream bars.

Their method of preparing the ice cream is similar to that of other plants. The piece is cut to the proper size and placed back into the hardening room to become thoroughly hard and dry. It is then taken to an Emerson Chocolate Dipping Machine, as shown in the illustration.

This machine is quite different from others in its design, in that six pieces of ice cream are placed on a feed board by the operator; these pieces of ice cream are then automatically picked up and placed onto six pins; these pins then travel a short distance and a chocolate dipper covers the ice cream with chocolate. Instead of lowering the ice cream into the chocolate pot, the pot is raised to the ice cream itself. This chocolate pot has a heating equipment which continuously holds the chocolate at a temperature of about 99 degrees. This pot keeps raising and lowering automatically to take care of each lot of ice cream as it appears.

Photo taken in Ives Ice Cream Plant, Minneapolis, Showing Chocolate Coated Ice Cream Bar Dipping Machine in Operation.

The ice cream then passes on and remains in the machine about one minute and ten seconds, or long enough for the chocolate coating to become thoroughly hardened. At this point the bars are removed from the machine automatically without handling and are deposited on a wrapping table.

With this method very smooth and neat looking bars are produced. They are uniform in appearance. The large holes, caused by the hooks, as well as bubbles, etc, do not appear as has been the case in hand dipping.

This machine dips six pieces of ice cream at a time and this operation is repeated nine times a minute, so that the actual capacity is fifty-four pieces each minute. This capacity, of course, can be reduced if the operator doesn't want to feed so heavy.

One thing that impressed us was the ease with which a large quantity of bars could be produced in a short time, with so little effort and at a minimum cost.

GOOD ADVICE.

"If you want to succeed, son," said Uncle Eben, "you gotter learn to git jes' as busy an' enthusiastic over reg'lar work as you does over a crap game."

ICE CREAM MANUFACTURER INVENTS DIPPING MACHINE.

Mr. A. E. Schumaker, proprietor of the Hoosier Machine Works and the Puritan Ice Cream Company of Columbus, Indiana, has perfected an invention for dipping ice cream bars, which, though only recently placed on the market, has already achieved remarkable popularity. Mr. Schumaker states that, since this machine has been placed before the ice cream industry by advertising, the response has been almost beyond belief, inquiries coming in from coast to coast by wire, phone and mail.

The machine, which is illustrated in an advertisement elsewhere in this supplement, is compact in construction, occupying only five square feet of floor space. It is entirely made of aluminum, with the exception of the moving parts, which are of nickeled steel. It consists of three parts, an upper frame which contains all the mechanism, a chocolate pan and a water pan. The motive power is furnished by a small Westinghouse motor, which may be operated by either direct or alternating current. The method of operation is shown in the illustration contained in the advertisement.

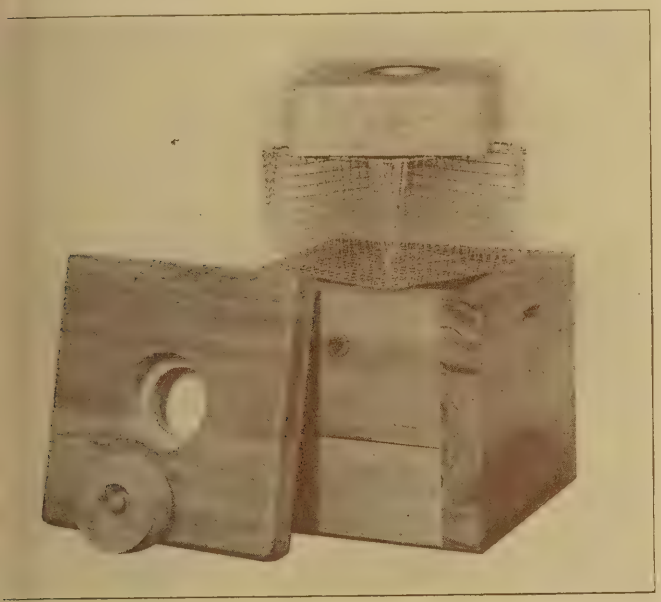
The machine requires only one operator, and will dip from 100 to 160 dozen bars an hour. Mr. Schumaker says that in the plant of the Puritan Ice Cream Company Columbus, Ind., previous to the installation of this machine, three people were kept busy all the time making these bars. The output was about 100 dozen a day. But now the ice cream maker does most of this work himself. He cuts enough brick one day for two or three days supply, and the next day runs the machine for an hour or two and dips them. They are then wrapped by some of the other help.

In this way the entire supply for a day or two can be turned out in about two hours. It is also claimed that the number of bars from a pound of chocolate runs exceptionally high by use of this machine.

It is a simple substantial machine, perfected by a practical ice cream manufacturer, and used in his own plant.

A NEW WATERPROOF CUSHION GASKET.

Mr. Ed. J. Wirfs, former president of the National Refrigerators, Inc., has invented a new type of air cushion gasket for cold storage and refrigerator doors, sectional cooling room and refrigerator joints, etc., that promises to be an important source of economy to the industry.



Mr. Wirfs realized the fact that a cold-air leaking refrigerator or cold storage room of any size or type represented a continuous loss to the owner. With the object in view of making refrigerator doors, windows and drawers, as well as the joints of portable refrigerators and cooling rooms, permanently airtight through constant use, he conceived the idea of introducing this gasket. Prospective buyers were quick to see the economy and usefulness of a resilient cushion gasket of this type, with the result that the feature proved very successful.

It is the firm belief of Mr. Wirfs that the waterproof cushion gasket is destined to come into universal use, as it is important in producing an airtight refrigerator, cooling room, cold storage rooms, etc. It will help minimize the ice consumption, and will make it easier to maintain a uniform temperature.

PECIAL REFRIGERATING CONTAINERS FOR CHOCOLATE COVERED ICE CREAM BARS.

A special container has been developed by the Amer-an Balsa, Inc., for handling chocolate covered ice eam cuts. It is a further refinement of the small ix made by the same company for this purpose and designed to hold 30 dozen cuts so that they will be in st class condition and yet easily available for sale.

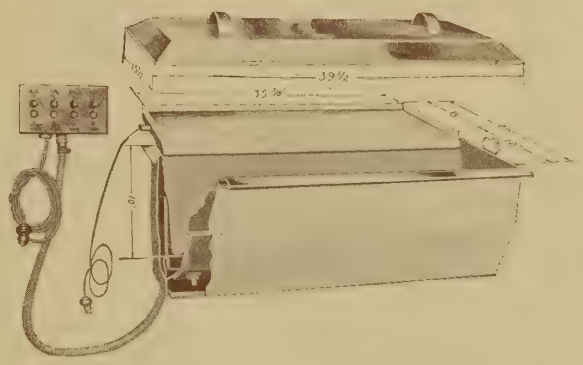
The cuts are stacked in a basket which sets into a alsa box, and on the basket rests a refrigerating pad furnish dry, clean refrigeration.

The box is made of 3 inches of Balsa and has a plug pe cover fitted with a miniature serving lid, giving a ole 5 inches in diameter. The refrigerating pad has a milar hole and the cuts are shipped with a minimum isturbance of the cold air inside.

There are no projections on the outside of these oxes, so they will stack easily. If desired, boxes may e filled at the factory and delivered in an open truck ithout special body equipment.

This company also manufactures a portable insulated ontainer or "vending box" for use at baseball parks, ailroad stations, etc. This box, which is slung from he shoulder, is replenished frequently from a supply abinet and even in summer will hold the bars in salable ondition for the short periods required without addi-ional refrigeration.

GLOBE ICE CREAM FACTORY TO OPEN NEW PLANT.



The Globe Ice Cream Company are making rapid rogress with the construction of their new factory lo-ated at the southwest corner of Jefferson and Hill Sts.

This factory is being erected at a cost of $400,000. he entire building is A-1 construction, and will contain he following departments: Strictly sanitary freezing nd mixing rooms with white glazed tile walls and white namel ceilings; a battery of 12 new type freezers will perate in the freezing-room, which will be in full view rom the sidewalk. The mixing room will contain 12 000-gallon glass lined tanks.

The power plant, which will be tremendous in size, ill also be in full view from the sidewalk in front of he buildings.

The newest types of machinery are being installed hroughout, regardless of cost. A complete laboratory

is being installed, which will be in charge of a competent dairy milk and ice cream chemist, this being necessary to insure absolute purity in all raw materials entering the manufacture of high-grade ice cream. Pure fruits will be used in season, and naturally, when the season is off, preserved fruits of the highest quality will be used. The new Globe Ice Cream Company will be ready for operation about June 1st.

The officers of the Globe Ice Cream Company are: Will E. Keller, president; A. A. Comey, vice-president and general manager; Marco Hellman, treasurer; J. M. O'Brien, secretary. The directors are: Will E. Keller, A. A. Comey, Marco Hellman, J. M. O'Brien, C. A. Fellows and Carl Leonardt.—Los Angeles Record.

A HANDY SMALL OUTFIT.

This is made by the Davis-Watkins Dairymen's Mfg. Company. It consists of a water-jacketed, chocolate melting kettle equipped with an electric heater suitable to attach to the ordinary electric lighting wire. It carries a thermometer which is fastened inside the chocolate kettle so that the operator can tell at all times the exact temperature of the chocolate.

It is arranged for operation for either two or three girls. One sticks the wire into the pieces of ice cream and hangs them on to the revolving wheel. Another girl

takes from the wheel two at a time, dips them into the chocolate and hangs them on to the wheel again. Another takes them off for wrapping.

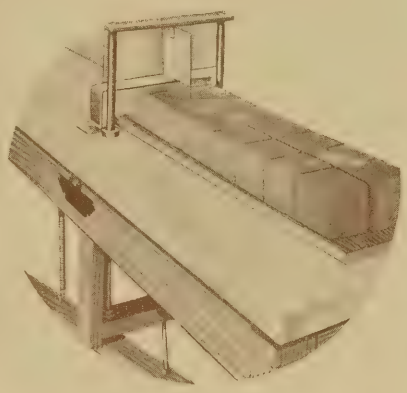
The chocolate quickly dries on the ice cream so that the dripping chocolate drips right back into the kettle.

This is certainly a very handy outfit and very satisfactory for speedy work. The outfit costs little money and is very simple to operate. Many ice cream companies are now using one or more of these outfits, depending on the output of the plant.

Complete details will quickly be furnished if you will write either on a letter or postal card, "Please send information and price regarding Progress Eskimo Pit Outfit," and send it to the nearest office of the Davis-Watkins Dairymen's Mfg. Company.

KEMP ICE CREAM FACTORY ROBBED.

John Johnson, watchman at the factory of the Kemp Ice Cream Company at St. Paul, was overpowered by four yeggmen about 3 a. m., Friday, March 31st. The men pounced upon the watchman as he was entering the basement, bound and gagged him, opened the safe, and escaped with $1,500. Two other employes in the basement at the time were unaware of the robbery.



Jiffy Ice Cream Cutter

Will cut any shape that can now be cut with the most expensive ice cream cutter. It will do it just as fast and with only a little practice.

It cuts Eskimo Pies uniformly and the quantity is only gauged by the speed of the operator.

Pints or Quarts require only the omission or insertion of the projecting knife shown in illustration to the right.

Non-rustable table of substantial construction.

Two Weeks Free Trial Offer

To any responsible ice cream manufacturer we will ship one of these cutters on two weeks free trial. Put it to any test. Make any comparison you desire. If not satisfactory all you have to do is to write for shipping instructions and we will pay freight both ways.

Illustrated circular sent on request.

CASHING IN ON THE NORTH POLE.

If the manufacturers of chocolate covered ice cream products will reflect for one moment on the pictorial and artistic allies awaiting them in the advertising of their products, they will be amazed to see the vistas which open along lines that have not already been overworked.

Pity the poor advertiser who gets out a new collar or a new silk stocking! Can you conceive of any new art angle to advertise them which is not reminiscent of Arrow Collars or Onyx Hosiery?

The North Pole at Your Service.

But here we have the entire polar region—so little known in the majesty and beauty of its coloring. Here is a new, fresh, pictorial advertising angle just waiting for the wide-awake manufacturer to link hands with the artist and present it to the public.

It will impress itself through the cooling suggestion of polar scenes of a color range entirely new to the public's eye. The Aurora Borealis, for instance, transformed into advertising designs, is just one suggestion of what a color appeal this "polar" approach would offer in the marketing of chocolate covered ice cream bars.

Why follow in the train of the conventional?

Has this delicious food confection come to stay?

It has. So has the advertising to promote its sales—and in just the ratio of this advertising attractiveness and appeal will the wide awake manufacturer benefit by the opportunity the polar regions offer as a picture.

Cool Colors for Ice Cream.

Experiments in the studio have proved that in order to create the appetite appeal for ice cream the range of colors must be intelligently chosen. Certain shades of blues, greens, lavenders and cool colors picturize the nature of ice cream in all its cooling suggestiveness—whereas reds, browns and other warm neutral tones have the opposite effect.

Here is a rare opportunity to reap the benefit of a fresh new pictorial approach on your advertising. It is an opportunity that means not only more sales but also a contribution to modern advertising art.

Try it on your artist—and watch him respond. It is the "thrill that comes once in a lifetime."

The Forbes Chocolate Company
CLEVELAND OHIO

OUTLOOK FOR SUMMER BUSINESS.

In complying with your request to write an article pertaining to the manufacture of chocolate coated ice cream bars, I wish to say that I am at a loss just how to express myself.

The manufacturers started the chocolated ice cream bar in this state Jan. 11 to Jan. 18th, and the following week I believe they did more business than anyone expected. This demand kept up to about the 10th of February, and since then there has been a steady decrease.

The manufacture of this chocolate bar is done in this state without extensive equipment, a double bottom boiler heated by an oil stove set in a table, with a wire strung above this table, and drip pans to catch the chocolate until the bar dries. The cutting is done by a brick knife. This is about all the equipment that the ice cream manufacturers who make the bars have at present.

From experiments we made in our plant we find there is quite a difference in the different kinds of Milk Chocolate used for coatings. We have so far found only one kind of coating that nearly fills the requirements that we have set out for it, and we have experimented with nine different kinds. Most of the coatings are too crisp, while some are too rubbery, some dip too thick and others dip too thin a coating. We have set a mark that coating costing us more than 12c per dozen is too expensive.

The cause for decrease in demand for the bar can be laid to several causes. One main cause is that the margin for the retailer in the country towns where ice costs them a cent a pound and express 5c to 8c per dozen, with the chance of losing some, is too small to operate on.

Another cause is the margin to manufacturer is too small unless he has a large volume of business. Most firms have not equipped themselves so that they can make bars with the minimum expense of labor.

One great good that this bar has done is that it has given a taste of ice cream to people that otherwise never would have tasted it, simply due to the novelty of the bar.

G. A. MEYER,
Grand Prairie Ice Cream Co.,
Stuttgart, Arkansas.

WILL TAKE A VACATION.

Mr. E. G. Rippel has resigned his position as sales manager with the Buffalo Foundry & Machine Co., Buffalo, N. Y., in order that he may take a much needed rest and be away from all business cares. Mr. C. W. Pearson, formerly assistant treasurer of the firm, has succeeded Mr. Rippel as sales manager.

Mr. Rippel organized the Buffalo Foundry & Machine Company 21 years ago and has built up the business from a $10,000 corporation to its present enormous proportions. He has been a consistent believer in extensive advertising and trade exhibits, backed up by quality goods. Visitors to the 1921 National Dairy Show still recall the wonderful exhibit put on by his firm there.

Mr. Rippel's many friends will wish him well in whatever business plans he may have after he has had his vacation. He is still a young man and, we predict, can not remain inactive very long.

RYAN'S EXHIBIT AT SOUTHERN EXHIBITION.

It may be a little late but "it is better late than never," to publish a picture of an exhibit at Southern Exhibition of the Association of Ice Cream Supply men. The illustration below is of the booth of the G. R. Ryan Manufacturing Company at the supply men's show in Atlanta last November. The G. R. Ryan Manufacturing Company are dealing in vanilla and vanilla blends exclusively. According to Mr. G. R. Ryan, the aim of this house is "To do at least one thing well, to produce something that is a little better and that gives a little more satisfaction; to gain your entire confidence and in return give you a security in our products that will develop your own means and purpose." The offices of the G. R. Ryan Manufacturing Company are at Rochester, N. Y.

"PROSPERITY PROVES THE FORTUNATE, ADVERSITY THE GREAT."—PLINY.

REASONS FOR THE DECLINE IN SALES AND SUGGESTIONS FOR THEIR INCREASE.

The problems confronting the ice cream manufacturer in the making of chocolate covered ice cream bars are being greatly simplified by the use of various devices for dipping and drying. The main difficulties are to maintain definite temperatures of the chocolate, the ice cream and the room in which the dipping is done. Many of the details have already been explained in an article in the February issue of the Ice Cream Review. In this number the definite temperatures at which the ice cream and the chocolate should be maintained were touched upon. The dipping room should be kept at about 65 degrees F. A cooler room will not interfere in any way except to be an inconvenience to the workers. A higher temperature, by increasing the moisture content of the air in the room, may result in an excessive amount of sweating on the chocolate after hardening.

Lack of uniformity has been one great contributing cause in the decreased sales of the bar. Some manufacturers started out by using a good grade of ice cream with a high butter fat content and when the initial sale of the bar was at its height changed to bulk cream. Many manufacturers are using too thin a chocolate coating with the object in view of reducing the material cost. I think this is a great mistake for several reasons. Thinly coated bars have a tendency to split or crack more readily while being shipped and handled, thus destroying the salability of the bars. If the cream is the least bit soft a very slight pressure of the hand on such a bar when being eaten may cause the cream to spatter on the individual eating it. When the cream is very hard a thinner coating will probably eat with less splitting than a heavier one but the average manufacturer cannot control the condition of the bar all the way to the consumer. The buying public is quick to notice a thin wafer like covering and it gives them an additional reason for thinking the bar is too small for a dime.

Chocolate covered ice cream bars are delicious and satisfying when properly made from high grade ice cream, properly coated with a full cream milk chocolate or a good vanilla chocolate coating and thinned with pure cocoa butter. There is a quality of chocolate coating best suited for the standard each ice cream bar manufacturer has adopted for his ice cream. It is obviously out of order to apply a poor grade of chocolate to a high grade ice cream and it would be equally unwise to attempt to make a high grade ice cream bar by coating a low grade of cream with a high grade chocolate.

The candy manufacturer seldom thins, to any great extent, a coating for the dipping of the cream centers, as he realizes that one of the pleasures of the candy consumer is to bite through a heavy snappy coating into the sweet cream center. High grade candies, almost without exception, are bound to be covered with a heavy coating of chocolate. What the candy manufacturer has learned through his experience should be of profit to the ice cream man.

Having established a standard of quality for the ice cream center and having selected a suitable coating to match the quality of the center, the next important step to consider is the equipment which will enable the manufacturer to compete successfully with those manufacturers who have grasped the importance of this new field of activity and provided themselves with the proper equipment for producing these bars at the lowest possible cost.

One of the best devices seen by the writer for the dipping of bars consists of a worm conveying arrangement for carrying the bars away from the dipper, removing the wire and placing them in position to be wrapped. An electrically heated tank for the chocolate is placed at one end and contains a thermometer in full view of the operator at all times, indicating the temperature of the water bath.

The introductory work in the sale of chocolate covered ice cream bars has been handled in many cities in a masterly manner and with the result that the public is thoroughly sold on the idea.

There is another field which is open to the ice cream manufacturer, not necessarily as an outlet for chocolate covered bars, but as a further means of increasing the consumption of ice cream. The time is coming shortly when the large chain five and ten cent stores and department stores will install machines for the dipping of ice cream bars in full view of the buying public. There are certain machines on the market at the present time which require but one or two operators and a very small amount of space. Such a machine would be ideal for the purpose. The department stores will then look to the ice cream manufacturer for his cream with which to produce these bars. An additional outlet for ice cream which the manufacturer has long been looking for will thus be created.

The answer to the question "How long will the demand for chocolate covered ice cream bars last"? I repeat, as stated near the close of my article in the February Ice Cream Review, the situation is entirely in the hands of the manufacturer of this newest and probably most popular confection.

H. C. KNAUPF,
Forbes Chocolate Co.

ESKIMO PIE PHILOSOPHY.

Said Pie Crust Joe to Pie Crust Pete—
"This Pie Crust Game is hard to beat."
Said Pie Crust Pete to Pie Crust Joe—
"You sure have said a mouthful, Bo."

The Pie Crust Peddlers thus agree,
And view the game in harmony—
Both well aware that Ice Cream Pie
Is doomed to live a day—and die.

The reason for the quick demise
Of Eskimo, and Polar Pies,
Is chiefly 'cause, through greed and lust,
The makers use a rotten crust.

They've all forgotten what's at stake—
That Pies their mothers used to make,
And upon which they placed their trust,
Were never better than their crust.

If they intend to keep alive
The Ice Cream Pies, and make them thrive,
They'll have to learn to place their trust
Upon a high grade chocolate crust.

With this in view, their only hope
To keep alive the Cold Pie Dope,
Is by the slogan, "Best or bust,"
And use of Eline's Ice Cream Crust.

Said Pie Crust Joe to Pie Crust Pete—
"Eline's Pie Crust can't be beat."
Said Pie Crust Pete to Pie Crust Joe—
"You sure have said a mouthful, Bo."

—By Wayne Hornbaker,
District Manager, Eline's, Chicago.

EVER HEAR OF ICE COLD CAKES SELLING LIKE HOT CAKES?

NO DIFFICULTY IN KEEPING BARS HARD.

In reply to your letter asking for further particulars in regard to keeping chocolate coated ice cream hard during hot weather: We have had no particular trouble keeping bars hard. As our business is nearly all shipping, of course it is entirely up to dealers after arrival of goods. They require the same care and attention usually given to brick cream.

A great many dealers are handling, in small towns where cabinet is not warranted, direct from tub, and carrying very few over. To date, with two months experience, we have three complaints only, that they were soft on arrival or did not keep well. Have had several days of warm weather; **the temperature at one time being 105 degrees in the sun at noon.**

In regard to cutting and dipping we have a New Era cutter, and special half-thickness slabs holding one gallon and cutting seventy-two pieces very rapidly. We do not reharden after cutting as with cream at 0 to 10 degrees. We can get it out of the way before it gets too soft to dip.

If we find that very hot weather causes us trouble we are equipped to do this work in cold room at a temperature of about 40 degrees.

L. A. CORNING,
President Buttercup Ice Cream Co., Inc., Hamlet, N. C.

GLAD THEY WENT INTO THE BUSINESS.

I recognize that chocolate coated ice cream is a timely subject for consideration and one in which the great army of ice cream manufacturers are just now vitally interested.

Chocolate coated ice cream descended upon the industry like an avalanche. Nobody was prepared for it, but everybody went into it and did the best they could. Fortunately, the process was so simple that everybody succeeded and it proved to be a life saver for many, turning the usual winter deficit into a clean balance sheet or providing a profit.

I think the majority of manufacturers of Iowa are making bars. I am incompetent to speak authentically as to the methods employed by the members of the Iowa Association or of their difficulties or successes. I will therefore confine my statements to the experiments, experiences and results obtained in our own individual business.

We commenced the making of chocolate coated ice cream bars last October. Our sales rose rapidly to the peak, which was reached in December, and have since steadily declined to nearly 75% less than the peak, and even with this decline, the bar business is still very satisfactory and we are glad we took it on.

We have installed only such additional equipment as we could make ourselves, awaiting the results of an entire year's experience before buying any of the many labor saving devices that are now upon the market. We are cutting 18 oblong cubes per quart, dipping by hand, using wire hooks and hanging over a home made dripping pan, using about eight ounces of chocolate to the dozen bars.

We furnish packing service in the city, which of course is of great assistance to our dealers in keeping their stock in good salable condition.

W. S. WILCOX, President,
Association of Ice Cream Mfgrs. of Iowa.

"POLAR B'AR" A POPULAR CONFECTION.

Among the most pretentious invaders of the chocolate covered ice cream bar is the "Polar B'ar," invention rights of which are held by the Polar B'ar Sales Company of Belvidere, Illinois.

This "B'ar" is the 1-20th or 1-22nd part of a quart brick of ice cream, placed between two specially coated wafers, then dipped in a thin coating of chocolate and wrapped. The wafers, which are guaranteed to stay crisp indefinitely, act as insulators, and keep the cream from melting when dipping or hardening. It is claimed that the cream can be handled in a much softer condition than when these wafers are not used, for the reason that they make it much easier to handle.

This company sells the wrappers to the manufacturer, at a price which covers his royalty, advertising and recipe also. Two grades of wrappers are furnished, one of a fine grade of foil, the other of another material, which sells for less than half of what the foil costs. These wrappers are cleverly embellished with an Aurora Borealis effect against a blue background, with two polar bears in the foreground, mouths agape and registering pleased expectancy, poised with their forefeet midway against a projection which we presume is the North Pole, on the top of which is a "B'ar."

This "B'ar" is a steady seller and a large repeater.

——— a National Exposition of the ice cream industry will be held in Cleveland the week of October 16th by The Association of Ice Cream Supply Men.

The same week, it has been announced, will be held the the annual convention of the National Association of Ice Cream Manufacturers.

All those whose profits and whose interest is in the business of ice cream will find in Cleveland next October the double focussing point of their great industry.

The Association of Ice Cream Supply Men

1328 Broadway New York City

of Safety

GET THE CORRECT WEIGHT RECORD FROM AN ACCURATE CONTROL.

THE CRESCENT CREAMERY COMPANY — ST. PAUL.

They say it is the last word in ice cream plants in the Northwest. The Crescent Creamery Company is one of the latest-constructed and most modern ice cream plants in the country.

The plant is a three story structure with as many windows in it as the architect could find room for. Upon entering, one can see to the left hand side the gen-

eral offices; on the other, the freezing room with a row of Miller freezers, four of them of 80 quart capacity and three of 40 quart capacity.

To begin an inspection tour, one should begin on the top floor. This is where all supplies are kept in store. We find the mixing room on the second floor. The mix is prepared in a large vat which has coils revolving to thoroughly mix the ingredients. The mix is passed from this vat through a viscolizer to the enclosed tubular cooler. From there it is carried to one of the three 1500 pound glass lined tanks. Here the mix is aged

and then drawn by gravity to the freezing room below. Next to the mixing room is a complete Mojonnier laboratory where every test is made.

Also, on the second floor is the churn room in which some of St. Paul's finest butter is made, and which is used in the manufacture of Crescent ice cream. There are three ripening vats and three large churns located in this room.

On the first floor, in the center, are three large hardening rooms with a total capacity of about 25,000 gallons.

The Crescent Company makes all their own ice with mechanical refrigeration in a 50 ton tank.

One of the good features of this plant is the enclosed shipping and loading platform. This is built in connection with the heated garage.

W. R. Cammack is president; G. E. Lindall is vice president; H. E. Cammack is secretary and E. A. Cammack is treasurer of the Crescent Ice Cream Company.

The picture on the left shows the room of the Crescent Creamery Company in which the ice cream mix is prepared. The mix is first prepared in the vat in the foreground. Then it is drawn through the viscolizer and enclosed tubular cooler to one of the three glass lined tanks in the rear. The freezers are located in a room directly below this one.

The picture below shows the room in which the freezers are located. Four of them are 80 quart and three are 40 quart capacity, Miller freezers. The hardening room entrance can be seen to the right. The door in the background leads to the main corridor and general offices.

NATIONAL ASSOCIATION OF ICE CREAM MANUFACTURERS' TWENTY-SECOND ANNUAL CONVENTION TO BE HELD IN CLEVELAND.

Chicago, April 5, 1922.

The Ice Cream Review:

The recent referendum sent out by our Board of Directors for the purpose of deciding the time and place of holding our next annual convention resulted in the selection of Cleveland, Ohio, the time to be after the Dairy Show.

Accordingly, the 22d Annual Convention will convene at Cleveland, Ohio, Hotel Hollenden, October 16th, 17th and 18th.

The convention will be held in connection with an exhibit of machinery and supplies to be given by the Association of Ice Cream Supply Men at the Municipal Auditorium during that entire week.

All available rooms at the Hotel Hollenden have been secured for active members of this Association and other ice cream manufacturers.

The Supply Men's Association has selected headquarters of its own, and Supply men are requested not to make reservations at the Hotel Hollenden, but to do this at the hotel selected by their association for its use during convention week.

Yours very truly,

N. LOEWENSTEIN,
Secretary.

"BETTER ICE CREAM MIX AT LOWER COST."

The above is the title of the 12-page booklet that has just been prepared by Mojonnier Brothers, milk engineers of Chicago, for distribution among the ice cream manufacturers. This booklet explains the advantages of using a vacuum pan in preparing the ice cream mix. It is well illustrated with pictures of dairy equipment and a typical illustration of the equipment necessary to go with it in a large modern plant. Mojonnier Brothers will be glad to send this booklet to anyone interested, upon request.

SPECIALIZED SERVICE

TRY THIS PACKER AT OUR EXPENSE

The Glacifer

A Dry Container for Preserving and Shipping Ice Cream.

You can save your customer from 5c to 10c per gallon with no cost to yourself.

You yourself can save from 5c to 10c per gallon on every gallon you ship.

You can extend your shipping business—reach people you have never reached before—get back some of the business you lost on account of high express rates.

Our circular tells all about this Packer—Write for it.

THE GLACIFER CO.
102 Merrimac Street Boston, Mass.

No Strings to This Offer

We will send a 20-quart Glacifier for bulk cream on 30 days trial. At the end of that time, pay for it if you like it, otherwise return it.

Price for single Glacifer, $12.00; in lots of 25 or more, $10.00.

Try one **now** in your own plant, under your own conditions, at our expense.

Speed Up
Your Brick Cutting Dept. with a "New Era"

Cuts standard ice cream slabs from molds into quarts, pints or any size desired, as fast as the operator can release the ice cream from the molds.

Can be adjusted to cut slices for Chocolate Coated Ice Cream Bars.

Absolutely Uniform

and unfailingly accurate is the "New Era" Ice Cream Brick Cutter. It's simplicity, speed and accuracy.

Reduces Costs

Our circulars tell all about this simple, practical machine. Get one.

Write us or our nearest representatives for circular and prices.

HOW CHOCOLATE COVERED BARS HELPED REVIVE OUR EXPORT TRADE.

All the thousands, perhaps millions, of American who have been in recent months buying and eating these bars probably do not realize that they have been stimulating our export trade. But that, writes the editor of The Grace Log, house organ of the large export and import firm of W. R. Grace & Company, is exactly what they are doing. He explains:

These bars are small bricks of ice cream covered with chocolate. It is prepared in factories where the temperature is low, wrapt in tinfoil, packed in ice and shipped all over the country. It made its first inroads upon the affections of this, the greatest candy consuming country of the world, about ninety days ago.

At that time the cocoa bean market was sadly depressed. Those foreign countries, such as Ecuador, Santo Domingo, West Coast of Africa, Brazil and Trinidad which in no small degree depended on their export of cocoa beans from which is manufactured cocoa powder, cocoa butter and chocolate, were in the same condition as the farmers of the United States—there was little or no profit in their crop. Consequently their purchasing power dwindled and they were but small buyers of American manufactured merchandise.

The craze for chocolate coated ice cream in the United States tremendously helped to revive the entire cocoa market. Other factors contributed, including some crop shortage. But the millions of little chocolate covered ice cream bars, so delicious to the palate and so easy to eat with the fingers, gave the market its big lift, as indicated by the following average prices per pound of different varieties of cocoa beans on the New York market in November and December, 1921, as compared with the middle of February, 1922:

	November-December 1921	February 1 1922
Guayaquil (Ecuador)	8¼c	12½c
Sanchez (Santo Domingo)	7c	10¾c
Accra (Africa)	7c	10¼c
Bahia (Brazil)	7 1/16c	10¾c
Trinidad (B. W. I.)	7c	12½c

The improvement in the market has been accompanied by an improvement in export, which makes the currency of the producing countries command a greater value in American dollars. For instance in December it required 4.15 Ecuadorian sucres to purchase one United States dollar's worth of American merchandise but on February 16th, 3.90 sucres sufficed. This was an encouragement for Ecuadorean purchase of American merchandise. While it is yet too early to estimate the full extent of this revival, still it is plain that the cocoa producing countries have been put on a greatly improved basis within three months.

All of this shows what the immense consuming power of the United States means to international commerce. A slight variation in the habits or tastes of the American people may turn scales between depression and prosperity in those countries producing foodstuffs and raw materials not grown here in sufficient abundance for our needs.

"Poor darling. You must have been frightened to death when the burglar broke into your room."

"Frightened's no name for it; I was dressing."

"How embarrassing, what did you do?"

"Oh, he was a gentleman burglar, he covered me with his revolver."—Inklings.

A "Babe Ruth" Autographed Regulation League Base Ball

FREE

A big selling feature that places the sale of chocolate coated ice cream balls in a class by itself.

Chocolate Coated Ice Cream

BASE 

BALL

TWO FLAVORS

"CHOCOLATE COATED ICE CREAM BASE BALL"
TRADE MARK REGISTERED.

10c

Our premium proposition will make big money for you. It is the thing that has made big money for others and the drawing power of a "Babe Ruth" autographed base ball has proved a winner in many leading cities.

The "Babe Ruth" wrappers on these chocolate coated ice cream base balls have a wonderful drawing power and are big sales repeaters. It is its popularity of the day that makes it self-advertising wherever it is tried—this is proved by the upward trend of the sales.

There is no big expense connected with making chocolate coated ice cream base balls, no extensive equipment needed. We furnish everything—molds, wrappers, Babe Ruth Base Balls, and all other necessary details.

Write for full particulars and learn the facts about this repeating sales producer.

FROM the affectionate home dessert of American childhood, science and a few years have raised ice cream to be the product of a tremendous industry.

The vegetable, animal and mineral kingdoms of Nature, and all the continents of the world contribute in some way to the materials and processes of its manufacture. Its flavored and refreshing goodness provides strength and pleasure to a hundred million people.

King of many hearts, commander of hundreds of millions of dollars, ice cream is preparing now to write an exclamation point of emphasis and wonder to the record of its romance, in the opening of the ***National Exposition*** for the ice cream industry in Cleveland, the week of October 16th.

At least 2,000 persons from the country over will attend the National Association of Ice Cream Manufacturers' Convention, October 16, 17, 18 and inspect the ***National Exposition*** the same week.

Ice Cream—A National Industry

MAY 1922

BULLETIN OF EVENTS

National Dairy Show, Minnesota State Fair Grounds, Minneapolis--St. Paul, Minn., October 7-14, 1922. W. E. Skinner, Secretary, Suite 222, 910 So. Michigan Ave., Chicago, Ill.

National Exhibition, Association of Ice Cream Supply Men. Cleveland, Ohio, October 16-21, 1922, headquarters Hotel Winton. Robert Everett, 1328 Broadway, New York, Secretary.

National Association of Ice Cream Manufacturers. 22nd annual convention, Cleveland, Ohio, Hollenden Hotel, October 16th, 17th and 18th. N. Loewenstein, 155 N. Clark Street, Chicago Secretary.

Southern Association of Ice Cream Manufacturers, annual convention, New Orleans, December 5, 6 and 7. J. W. Clopton, Secretary, Decatur, Ala.

WE BELIEVE our readers will be particularly interested in the special section of this issue devoted to the question of ice cream packages. In compiling the information contained therein we have called upon the experiences of ice cream manufacturers the country over. We know of no one more competent to throw light upon this important subject than the men who are actually confronted with the problems concerned with packaging ice cream and getting it to the consumer in proper condition. Every manufacturer in ice cream, whether selling it in bulk or putting it on the market in some other form, is confronted with the problems which he will find discussed in our special package section.

In securing this information we have invited the cooperation of many people and right here we want to express our appreciation of their hearty response. By giving us their experiences and suggestions they have performed a distinct service for the ice cream industry. We are passing this valuable information along to the readers of The Ice Cream Review, feeling that we are giving them first hand experience which will be of inestimable value to them in their business. In doing so we are but attempting to live up to the confidence reposed in us by the thousands of ice cream manufacturers who look to The Ice Cream Review for the latest and best information relative to their business. We believe that you will find information in this issue which you can use in your business. Even though you may feel that the methods used by other manufacturers are not better than your own you can learn what others are doing.

WE BELIEVE that true friends of the ice cream industry will always have in mind that its interests are closely linked with the interests of the dairy industry as a whole. The ice cream business is a dairy business first, last and all the time. The chief claim for ice cream as a food arises from the fact that it is a dairy food. The various associations of ice cream manufacturers have recognized this fact by discouraging the use of foreign fats in ice cream making.

With this thought always in mind they will be at all times interested in whatever develops and promotes the dairy industry. They are going to continue to support those agencies which are advertising the industry. The National Dairy Show is one of these. We hope that readers of The Ice Cream Review will attend the big show in October in large numbers.

While dwelling upon the subject we want to add that we hope that the good people of St. Paul and Minneapolis will not again let the National Dairy Show be held in their midst without visiting it. Last year they apparently looked upon it as a farmer's show and stayed away. We talked with several of the natives and they gave as their reason for not visiting the show that there was nothing in it of interest to them.

The business men of the Twin Cities have guaranteed 100,000 paid admissions at the 1922 Show. If they merely buy 100,000 tickets and leave them pigeon-holed in their office desks they may be making good, so far as finances are concerned, but they will not be making good so far as the National Dairy Show is concerned, neither will they be living up to their full responsibilities.

It is clearly up to the business men of the Twin Cities to sell the National Dairy Show to their people. The advertising that will be done throughout the Northwest, in one form or another, will insure a splendid attendance from outside points. The men who are putting up this big guarantee need not worry about the success of the National Dairy Show so far as outside attendance is concerned. What they need to worry about is the attendance upon the part of their own people.

When next October comes, if the people of Minneapolis and St. Paul generally look upon the National Dai

ow as they did last October, the business men who ve made this guarantee may well consider that they ve made a dismal failure of the whole proposition. ir suggestion to them is to quit advertising the Na- nal Dairy Show as a farmer's institution. True, the iry cow is the foundation upon which the whole in- stry rests, but the city consumer can find more of real terest and value to him at the National Dairy Show an can the average farmer. He will learn so many portant things that vitally concern his welfare with ich the farmer is already familiar.

We hope that the business interests of St. Paul and inneapolis will not overlook their opportunities as well their responsibilities.

THE ice cream manufacturer who builds up a big gallonage is enabled to buy equipment and employ ethods which he could not hope to do without increased lume. This is not offered to discourage the little fel- w but to encourage him. We believe in increased vol- ne and we don't care how big the business gets so long it is properly cared for. In fact, we believe that the siness must show an increase from year to year or it is a dangerous way. It is seldom that a business re- ains at a standstill. The only safe way for the busi- ss man is to use every effort to increase the volume.

We believe it is a laudable effort when the ice cream anufacturer uses every opportunity to increase volume. creased volume, however, must never be gained at the pense of quality and service. It is a short sighted licy to sacrifice any of the fundamentals of success in der to gain a temporary increase in business. The man the firm who has built up a reputation for integrity, th in the conduct of the business and in the product, n ill afford to adopt any measures to increase volume less such measures will protect that reputation. In her words, increase in volume is only desirable when is procured on the right basis. Some men in business e so greedy to increase volume that they are willing to so at no profit, or even at a loss. They live in hopes at something will happen in the future to enable them make some money on the increased volume. Some- nes something does happen but it isn't usually what ey are hoping for.

Our big successful businesses have not been built in at way. In order to build a big business it is essential at the business shows a profit. A business cannot be tablished right unless it is making money, and it is ite as necessary to show a profit on the increased vol- ne as on the regular volume. When it does not show profit there is a temptation to cut down expenses, to wer the quality or the service, or both. This is one the dangers of increasing volume on the basis of no ofit. Don't do it. Keep up the quality of your prod- t and quality of your service. That is a sure way of ing a successful business.

In building a business in this way don't worry about at somebody is going to say about your increased lume. Put out good goods, run your business so as to show a reasonable profit and employ every means known to good business to increase your volume. Your busi- ness will then be established on a firm foundation and you will be in position to give real service to your cus- tomers and fully live up to the responsibilities which rest upon you as a manufacturer of one of the most delight- ful foods known to mankind.

ON PAGE 12 appears a bulletin issued by the Na- tional Association of Ice Cream Manufacturers in which attention is called to a proposed classification change on ice cream shipments. It appears that some time ago the American Railway Express Company pro- posed to the Interstate Commerce Commission that ship- ments of ice cream in cans less than 5-gallon capacity, packed in outside containers customarily used for 5 gallons, or shipments in cans of less than 10-gallon ca- pacity packed in outside containers customarily used for 10 gallons, should be charged for at gross weight less 25%. Before the matter came to the official attention of the Interstate Commerce Commission the officers of the National Association of Ice Cream Manufacturers held a conference with the Express Company's officials and the result of this conference was that the proposed classifi- cation change was withdrawn and is being held in abey- ance for 90 days, pending the result of the Associa- tion's efforts to discourage the practice followed by some ice cream manufacturers of using oversized packers.

The officers of the National Association of Ice Cream Manufacturers will do everything they possibly can do discourage this practice and in doing so we feel they are absolutely right.

ON ANOTHER page we publish an address delivered by Mr. K. L. Carver, a successful ice cream manu- facturer, at the annual convention of the California As- sociation of Ice Cream Manufacturers. Mr. Carver is fully convinced that the development of the ice cream industry to its fullest proportions depends upon educat- ing the consumers of the country to buy package ice cream instead of bulk. He has some very advanced ideas relative to boosting sales of ice cream in package form and very forcefully presents arguments to back up his ideas. You will enjoy reading his address.

PLANS are progressing nicely for the big doings in Cleveland next October. If you haven't made a resolution to attend the Exposition and the con- vention do so right now. Then keep it.

IF SPRINGTIME, with all its inspiring effects on every live thing, causes you to feel that there are better times just ahead, don't attempt to throw off the feeling. There are other reasons for making you feel that way. Better terms are ahead, and there is going to be lots of business for the "go-getter". If you don't belong to that class you—well, you had better join in because "it's in the air."

A Simplified Method of Instruction in Standardization of the Ice Cream Mix

By PROF. N. E. OLSEN, Dairy Department, Kansas State Agricultural College

FOREWORD.

THE following is offered to beginners in Ice Cream manufacture and others in the hope that what seems to them, a rather puzzling and complicated process may be made simple and easily understandable. It is purposely made intensely practical with the technical submerged in order not to confuse. The reader requires only common arithmetic to follow the reasoning throughout.

PROF. N. E. OLSON.

For the benefit of critics allow me to say that the writer is fully aware that the serum solids in skimmilk are ordinarily taken as 8.91 per cent rather than 9.0 per cent, that sugar sometimes may contain less than 100 per cent solids and that gelatine is never 100 per cent solids and also that flavor is a part of the mix and is often considered as a part of the 100 pounds. However there is always a certain amount of evaporation during pasteurization and so regardless of how technical one may become in standardizing and preparing an ice cream mix the final results can not be as he calculated they would be unless the final mix is analyzed and the necessary corrections made.

To the student, the man who must standardize the mix, the author wishes to say: Strive for uniformity, endeavor always to make an ice cream of essentially the same composition from day to day. You must use the raw materials which are available at the time when a mix must be made. If you will study the method herein given you need have no difficulty with uniformity of composition and quality, in so far as standardization is a factor.

Composition of Materials Used.

Skimmilk—9% serum solids (approximately).
4% milk—4% fat, 8.64 serum solids.
8.64% serum solids.
35% cream—35% fat, 5.95 serum solids.
5.85% serum solids.
Skimmilk powder—95% total solids (serum solids).
Plain condensed skimmilk—20% total solids (serum solids).
Sweetened condensed skim—28% serum solids, 40% cane sugar milk.
Unsalted butter—must be tested for moisture.
Sugar—100% total solids (approximately.
Gelatine—100% total solids (approximately).

In purchasing condensed products always request an analysis of each batch or shipment.

Quality of the Product.

The object of this paper is primarily to teach standardization but the writer can vouch for the quality of product made from any of the formulas, having tested them thoroughly in a make of some forty or fifty thousand gallons.

The Qualities of a Good Ice Cream Mix.

The Kansas Ice Cream Law reads as follows:

"Ice Cream is a frozen product containing not les than ten per cent milk fat, and not less than a total o twenty per cent milk solids; said product consisting o a flavored, sugar-sweetened mixture of cream or crea and milk, or the sweet pure products of cream and milk with or without the addition of gelatine, vegetabl gums, or such other wholesome stabilizers as may b approved by the State Dairy Commissioner, to whic mixture may be added pure, fresh, sweet, wholesom eggs, fruit or fruit juice, cocoa, chocolate, or nuts."

The law requires ten per cent of milk fat and twent per cent total milk solids which means that the mi must contain ten per cent of milk solids not fat o serum solids.

Since the fat requirement for fruit ice cream is th same as for plain ice cream, it is either necessary t make separate mixes for plain and fruit ice cream o carry around twelve per cent of fat in the plain ic cream.

The sugar content of a good mix varies from abou eleven per cent to as high as sixteen per cent, accordin to the requirements of the trade. Twelve per cen sugar is sufficiently sweet for most trade.

Gelatine is our best stabilizer and one-half of on per cent is sufficient if a high grade of gelatine is use More is required where the cheaper grades of gelatin are used.

Standardization by Steps.

In this method a basic formula is adopted whic gives the composition of the mix. For example, a mi is taken with the following composition: Fat, 12 pe cent; serum solids, 10 per cent; sugar, 12 per cen and filler, .50 per cent. This constitutes our basi formula.

Formula No. I. Basic.

Ingredients	Lbs. per 100	Per Ct. Fat	Per Ct. S. S.	Per Ct. Sugar	Per C T.
Fat	12	12	..	..	12
Serum solids	10	..	10	..	10
Sugar	12	..	..	12	12
Gelatine	.50	..	..	..	.
					34.

Formula No. II.

In which skimmilk furnishes the serum solids and pu milk fat the necessary butterfat.

Ingredients	Lbs. per 100	Per Ct. Fat	Per Ct. S. S.	Per Ct. Sugar	Per C T.
Pure milk fat	12	12	..	..	12
Skimmilk powder	10.5	..	..	..	10
Sugar	12	..	10	12	12
Gelatine	.5	..	..	..	.
Water	65	..	..	..	..
	100.0	12	10	12	34.

Calculation.

Skimmilk powder is calculated as 95% serum soli (total solids).

The amount necessary to supply 10 lbs. of serum soli is then $\frac{10}{95} \times 100 = 10.5$ lbs. of skimmilk powder. Enou water is added to bring the total mix up to 100 pounds.

Formula No. III.

Substituting unsalted butter for pure milk fat.

Ingredients	Lbs. per 100	Per Ct. Fat	Per Ct. S. S.	Per Ct. Sugar	Per C T.
Unsalted butter (84% fat)	14.3	12	..	..	12
Skimmilk powder	10.5	..	10	..	10
Sugar	12.0	..	..	12	12
Gelatine	.5	..	..	..	.
Water	62.7	..	..	..	..
	100.0	12	10	12	34.

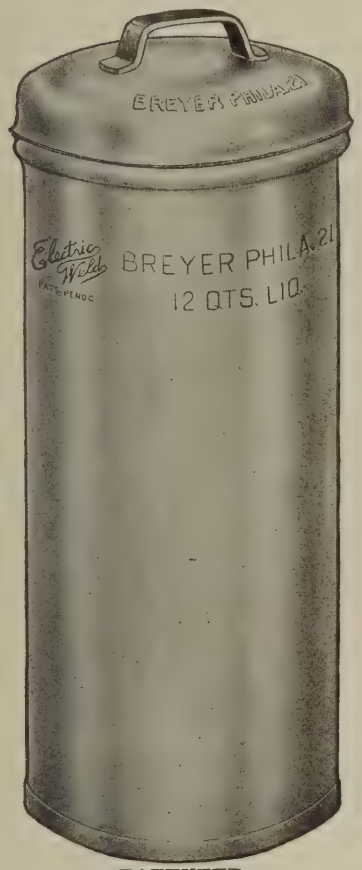
The



CAN SERVICE AT LOWEST COST

Electric Weld

TRADE MARK REG.

No Solder No Rivets = NO LEAKS

RIVETLESS — SOLDERLESS ICE CREAM CANS

PATENTED.
The Electric Weld Ice Cream Can.

should be judged on a basis of the ratio of cost to service. The can that makes the most trips for the least cost is the best. We have other important features.

WE GUARANTEE to replace any Electric Weld can which in ordinary service—

1. Breaks at the welded joints.
2. Leaks during the life of the can, not only when new, but as long as the can is in use whether it has been retinned or not.
3. Opens at the bottom joint.
4. Shows defective workmanship or material.

WE ALSO GUARANTEE that Electric Weld Cans

1. Are hand dipped in pure Straits tin with an average coating of an ounce and a quarter per square foot of surface.
2. That we do not use solder, lead or rivets.
3. That they can be retinned successfully without using solder or in any way changing the construction.
4. That we use special hard finish steel sheets which are best for tinning and offer unusual resistance to blows, wear and tear.
5. That the capacities are correct on each size within the tolerance permitted by each State.
6. That our covers are interchangeable with standard makes of cans.
7. That no annealing of the can takes place which would soften the metal; our cans permit using the steel in its original hardness without changing, softening or destroying its original structure.
8. That we use full standard gauge material and do not add to the weight with unnecessary re-inforcements.
9. That Electric Weld cans are "water tight" before tinning and remain so always.

BROOKLYN (No. 5 Bush Terminal Bld.) OAKLAND, CAL. (335 Cypress St.)

WE CAN MAKE PROMPT SHIPMENT OF EMBOSSED CANS

ACCURATE AND INSTANTANEOUS TESTING OF OVERRUN IS THE RESULT OF A GOOD TESTER.

Calculation.

In this formula it will be noted that but one ingredient is different from the preceding (Formula No. II); that is, the butterfat carrier. Since unsalted butter contains moisture and curd in addition to the butterfat it is necessary to test the butter for moisture and assume the curd is 1 per cent. In this case we assume the moisture test to be 15 per cent.

15% moisture
1% curd

16%
84% fat

100%

The butter required to furnish the desired 12 pounds of fat is then:

$$\frac{12}{84} \times 100 = 14.3 \text{ lbs. butter needed.}$$

Water is then added to bring the total to 100 pounds.

Formula No. IV.

In which fresh skimmilk is used in place of the water and part of the skimmilk powder, some of the latter still being retained to bring the serum solids to the desired 10 per cent.

Ingredients	Lbs. per 100	Per Ct. Fat	Per Ct. S. S.	Per Ct. Sugar	Per Ct. T. S.
Unsalted butter	14.3	12	..	..	12.00
Fresh skimmilk	69.2	..	6.22	..	6.22
Skimmilk powder	4.0	..	3.80	..	3.80
Sugar	12.0	..	..	..	12.00
Gelatine	.5	..	..	12	.50
	100.0	12	10.02	12	34.52

Calculation.

Referring back to Formula No. III we find:
Skimmilk powder .....10.5 lbs.
Water .....62.7 lbs.

Which added together gives 73.2 lbs. of skimmilk or serum solids mixture containing 10 lbs. of serum solids. In order to standardize our new mixture of fresh skimmilk and skimmilk powder it is necessary to know what per cent 10 lbs. is of 73.2 lbs. Therefore:

$$\frac{10}{73.2} \times 100 = \text{approximately } 13.7\% \text{ serum solids.}$$

By the Pearson square method of standardization we are enabled to obtain the desired parts of fresh skimmilk and skimmilk powder necessary to make 73.2 lbs. of skim mixture containing 13.7% or 10 lbs. serum solids.

9% serum solids in skimmilk. — 81.3 lbs. skimmilk.

13.25% serum solids desired.

95% serum solids in skimmilk powder. — 4.7 lbs. skimmilk powder.

86.0 lbs. skimmilk mixture containing 13.7% serum solids.

Our proportion then is:

(Mixture from square) 85 lbs. : (Mixture desired) 73.2 lbs. :: (S. M. P. from square) 4.7 lbs. : (S. M. P. desired) X

$$86\ X = 73.2 \times 4.7$$
$$86\ X = 344.04$$
$$X = \frac{344.04}{86} \text{ or 4 lbs. skimmilk powder.}$$

Audel's "Answers on Refrigeration"

Sent Prepaid on Receipt of $2.00.
OLSEN PUBLISHING CO.
210 Sycamore St. Milwaukee, Wis.

Subtracting 4 lbs. of skimmilk powder from 73.2 lbs. leaves 69.2 lbs. fresh skimmilk.

The results as shown in Formula No. IV proves our calculation to be correct.

Formula No. V.

In which whole milk testing 4 per cent fat is substituted for the skimmilk and part of the unsalted butter. Naturally the calculation will be similar with milk of any other fat percentage. Since the whole milk will carry practically the same amount of serum solids as the skimmilk no calculation is necessary for serum solids except to prove the correctness of the formula.

Ingredients	Lbs. per 100	Per Ct. Fat	Per Ct. S. S.	Per Ct. Sugar	Per Ct. T. S.
Unsalted butter	10.85	9.15	..	..	9.15
Whole milk (4% fat)	72.65	2.90	6.27	..	9.17
Skimmilk powder	4.00	..	3.80	..	3.80
Sugar	12.00	..	..	12.00	12.00
Gelatine	.50	..	..	..	.50
	100.00	12.05	10.18	12.00	34.62

Calculation.

Referring back to Formula No. IV we find:
Unsalted butter .....14.3 lbs.
Skimmilk .....69.2 lbs.

Which added together gives 85.5 lbs. of butterfat mixture or cream containing 12 lbs. of butterfat. In order to standardize our new mixture of unsalted butter and 4 per cent milk it is necessary to know what per cent 12 lbs. is of 83.5 lbs. Therefore:

$$\frac{12}{83.5} \times 100 = \text{approximately } 14.4\% \text{ fat.}$$

Again by the Pearson square method of standardization we are enabled to obtain the desired parts of unsalted butter and 4 per cent milk to make 83.5 lbs. of cream containing 14.5 per cent or 12 lbs. of butterfat.

84% fat in unsalted butter. — 10.4 lbs. butter.

14.4% fat desired.

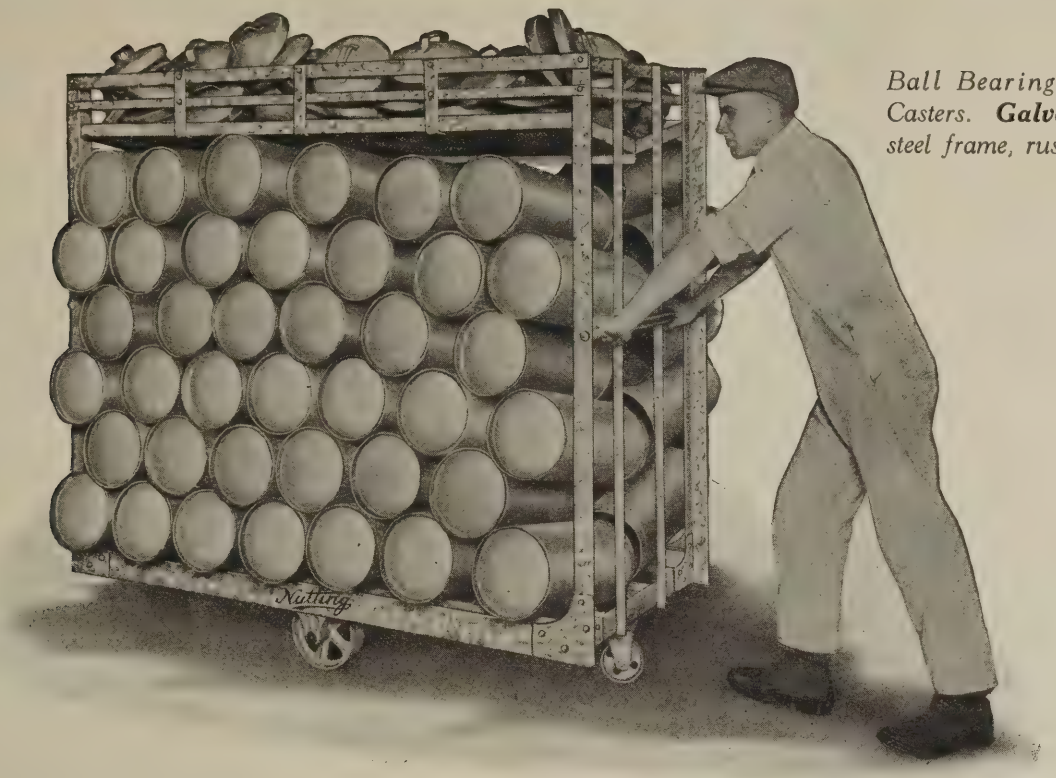
4% fat in whole milk. — 69.6 lbs. of 4% milk.

80.0 lbs. of 14.4% cream.

Our proportion then is:

80 : 83.5 :: 10.4 : X

$$80\ X = 868.40$$
$$X = \frac{868.40}{80} \text{ or 10.85 lbs. of butter.}$$



Subtracting 10.85 lbs. of butter from 83.5 lbs. of cream leaves 72.65 lbs. of 4 per cent milk. The results as shown in Formula No. V proves our calculation to be correct.

Formula No. VI.

In which cream testing 35 per cent is substituted for the unsalted butter and a part of the 4 per cent milk. Naturally the calculation will be similar with cream or milk of any other fat percentage. Since the cream will carry practically the same amount of serum solids as we have in Formula No. V, no calculation is necessary for serum solids except to prove the correctness of the formula.

Ingredients	Lbs. per 100	Per Ct. Fat	Per Ct. S. S.	Per Ct. Sugar	Per Ct. T. S.
35% cream	28.00	9.80	1.64	..	11.44
4% milk	55.5	2.22	4.79	..	7.01
Skimmilk powder	4.0	..	3.80	..	3.80
Sugar	12.0	..	..	12	12.00
Gelatine	.5	..	..	..	.50
	100.00	12.02	10.23	12	34.75

Referring back to Formula No. V we find that we require 83.5 lbs. of 14.4 per cent cream. Then by the square method of standardization we have:

Ball Bearing Swivel Casters. ***Galvanized*** *steel frame, rust-proof.*

Built *RIGHT* For Your Work

A Stronger Truck—Better Finished—Easier Running—DURABLE

THE moment you examine the **Nutting** Ice Cream Can Truck you will realize why it gives better and longer service.

Nutting

Ice Cream Can Truck

has a frame built of heavy structural angle steel riveted like a steel bridge, and specially braced at the corners to withstand shocks. The frame is entirely galvanized, instead of merely coated with aluminum paint.

The main wheels are 8¼ inches high, with wide, flat face, smoothly machined to save the floors. Cold rolled steel axle, heavy axle collars and boxes. These features of strength give you a truck that will stand years of hard, daily use and freedom from repairs.

The Easily Handled Truck—ball bearing swivel casters. Balance type, for quick turning. Rail around top holds all covers and keeps them with cans. Wooden bars at bottom fully protect cans from denting.

Note REDUCED Prices

Nutting Ice Cream Can Trucks earn their reasonable cost over and over by enabling you to **keep your cans on wheels,** the handy time and labor saving method for both large and small plants.

SELECT QUALITY FOR SERVICEABILITY IN TUB COVERS.

35% fat in cream. 10.4 lbs. 35% cream.

4% fat in whole milk. 20.6 lbs. 4% milk.
31.0 lbs. 14.4% cream.

Our proportion then is:

$$31 : 83.5 :: 10.0 : X$$
$$31X = 868.40$$
$$X = \frac{868.40}{31} \text{ or } 28 \text{ lbs. of } 35\% \text{ cream.}$$

Subtsartcing 28 lbs. of 35 per cent cream from 83.5 lbs. of 14.4 per cent cream leaves 55.5 lbs. of 4 per cent milk. The results as shown in Formula No. VI proves our calculation to be correct.

Formula No. VII.

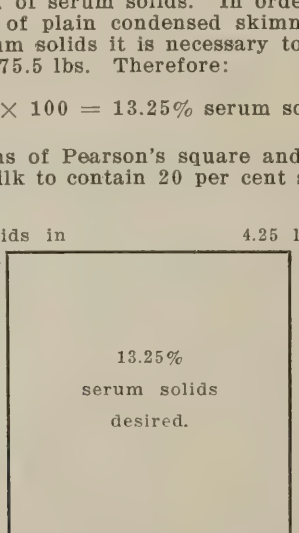
In which plain condenced skimmilk furnishes a part of the serum solids, replacing the skimmilk powder and a part of the milk.

Ingredients	Lbs. per 100	Per Ct. Fat	Per Ct. S. S.	Per Ct. Sugar	Per Ct. T. S.
Cream 20.6%	58.3	12.00	4.16	..	17.27
Plain condensed skim	29.2	..	5.84	..	4.73
Sugar	12.0	..	..	12.00	12.00
Gelatine	.5	..	..	..	.50
	100.00	12.00	10.00	12.00	34.50

Calculation.

Referring back to Formula No. II we find that we require:

650 lbs. water
105 lbs. skimmilk powder



75.5 lbs. skimmilk mixture

containing 10 lbs. of serum solids. In order to standardize our new mixture of plain condensed skimmilk and normal skimmilk for serum solids it is necessary to know what per cent 10 lbs. is of 75.5 lbs. Therefore:

$$\frac{10}{75.5} \times 100 = 13.25\% \text{ serum solids.}$$

Then by means of Pearson's square and assuming plain condensed skimmilk to contain 20 per cent serum solids, we have:

20% serum solids in condensed milk. 4.25 lbs. plain condensed.

9% serum solids in skimmilk. 6.75 lbs. normal skim.

11.00 lbs. skimmilk mixture containing 13.25% serum solids.

Our proportion then is:

$$11 : 75.5 :: 4.25 : X$$
$$11X = 320.875$$

Subtracting 29.2 lbs. from 75.5 lbs. leaves 46.30 lbs. of skimmilk.

Now since this formula is to be made with cream we must add our 12 lbs. of butterfat to the 46.30 lbs. of skimmilk which will give us 58.3 lbs. of cream testing

$$\frac{12}{58.3} \times 100 = 20.6\% \text{ butterfat.}$$

Cream testing 20.6 per cent can then be standardized as in Formula No. VI.

Formula No. VIII.

In which sweetened condensed skimmilk furnishes a part of the serum solids and a part of the sugar.

Ingredients	Lbs. per 100	Per Ct. Fat	Per Ct. S. S.	Per Ct. Sugar	Per Ct. T. S.
Cream 35%	34.3	12	2.007	..	14.007
Skimmilk	44.68	..	4.026	..	4.026
Sweetened condensed	14.2	..	3.97	5.68	9.65
Sugar	6.32	..	..	6.32	6.32
Gelatine	.50	..	..	..	.50
	100.00	12	10.003	12.00	34.503

Calculation.

Sweetened condensed skimmilk is taken to contain 28 per cent serum solids and 40 per cent cane sugar.

It is impossible to make a simple calculation of this mix except by means of higher mathematics (algebra) since we have too many unknowns for ordinary arithmetic. The above formula was calculated in that manner but the method is obviously not given here. It is suggested that for practical purposes the worker use the trial mix system which though a cumbersome method is the only one which a student lacking a knowledge of algebra is capable of using.

A good general rule to follow in the making of a formula containing sweetened condensed skimmilk is as follows. If it is desired that the mix contain 12 per cent of sugar use 15 pounds of condensed milk while if 14 per cent of sugar is desired as much as 20 pounds of condensed milk may be used.

Suppose then in our present case we use 15 pounds of sweetened condensed skimmilk. This would contain 40 per cent of 15 or 6 lbs. of sugar and 28 per cent of 15 or 4.20 pounds of serum solids. Since our mix must contain 12 per cent of sugar it is necessary to add 6 pounds more of sugar and since we desire 10 per cent serum solids the remaining 5.8 lbs. must come from our sweet milk and cream.

Our formula now stands:

Sweet condensed ..... 15.00 lbs.
Sugar ..... 6.00 lbs.
Gelatine ..... .50 lbs.

21.50 lbs.

Subtracting 21.5 lbs. from 100 leaves 78.5 lbs. to be supplied as cream containing 12 lbs. of butterfat.

The necessary cream would test

$$\frac{12}{78.5} \times 100 = 15.3\%$$

or 15.5 per cent for convenience. The cream can be made up in the usual ways by the method hereto given.

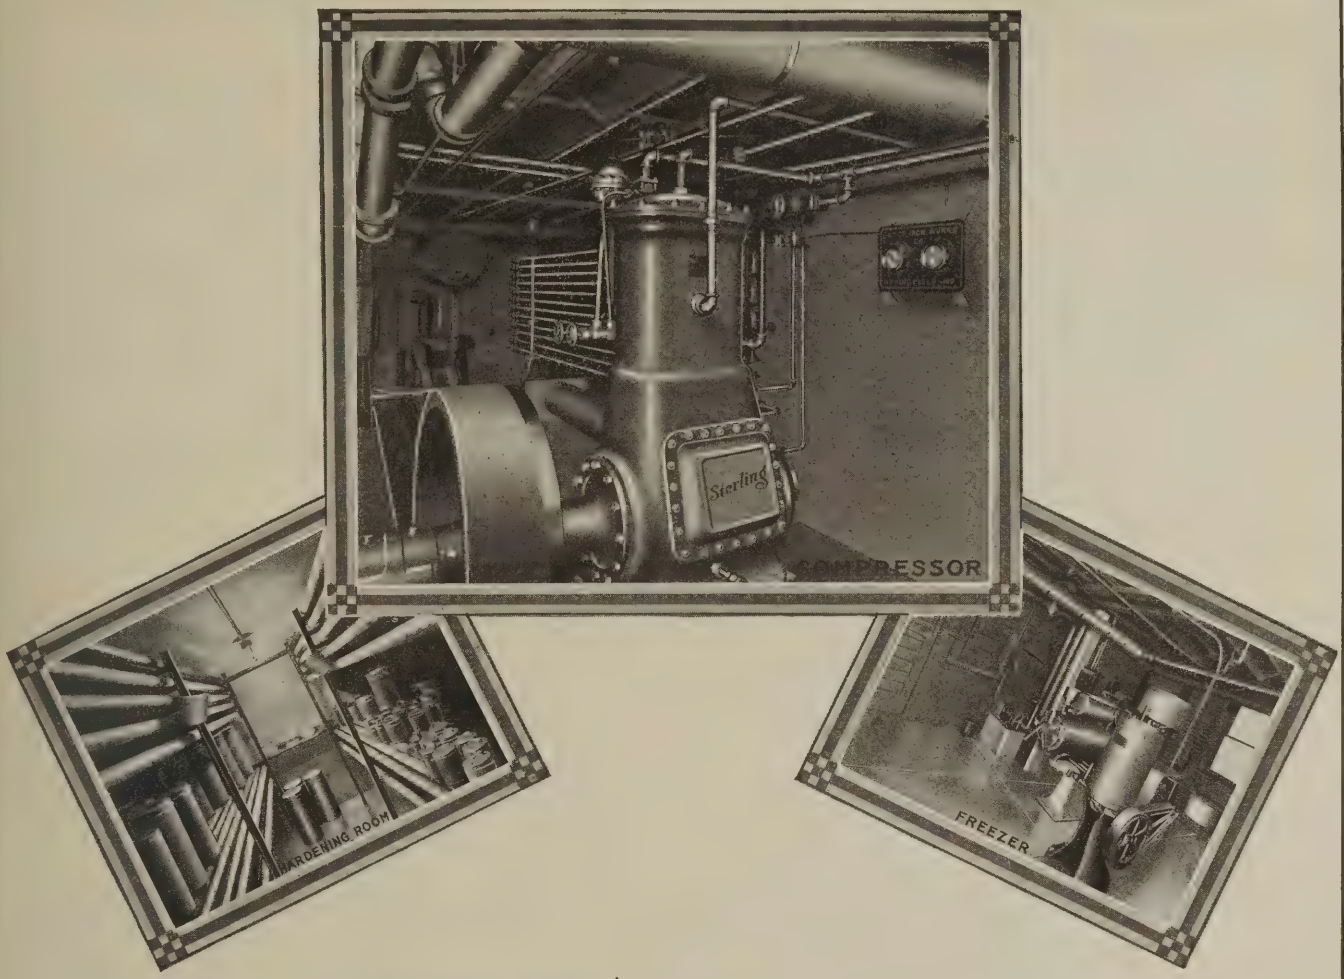
Subtracting 12 from 78.5 lbs. leaves 66.5 lbs. 66.5 lbs. times 9 per cent equals 5.98 lbs. of serum solids which appears to be satisfactory. Our formula then is as follows:

Formula No. IX.

Ingredients	Lbs. per 100	Per Ct. Fat	Per Ct. S. S.	Per Ct. Sugar	Per Ct. T. S.
Cream 15.3%	78.5	12	5.98	..	17.98
Sweet condensed	15.0	..	4.20	6.00	10.20
Sugar	6.0	..	..	6.00	6.00
Gelatine	.5	..	..	..	.50
	100.0	12	10.18	12.00	34.68

Preparing the Mix.

Having adopted a formula and standardized according to the ingredients on hand one can make up any quantity of mix simply by multiplying all weights by the following factor:



$$\frac{\text{Lbs. of mix desired}}{100} = \text{Factor}$$

For example:

$$\frac{1200 \text{ lbs. of mix desired}}{100} = 12$$

Pasteurize the entire mix at 145 to 150 degrees F. and emulsify, viscolize or homogenize hot, cooling preferably over a cooler and down to 35 to 40 degrees F. Age for 24 to 48 hours in order to restore the viscosity before freezing.

Tell us what you want, or what you have that you don't want, and we'll fix up a little Ad for you and insert it in the next issue of The Ice Cream Review. You just stay at home and wait for results. You'll soon have your hands full.

COATED ICE CREAM BARS HELPED TO TAKE STING OUT OF PROHIBITION.

Proposed Classification Change on Ice Cream Shipments

Bulletin No. 53 of the National Association of Ice Cream Manufacturers

IN CLASSIFICATION DOCKET NO. 3 the American Railway Express Co. proposed to the Interstate Commerce Commission the following addition to the classification of ice cream, to become effective June 1, 1922:

"Shipments in cans of less than five gallon capacity packed in outside containers customarily used for five gallons, or shipments in cans of less than ten gallon capacity packed in outside containers customarily used for ten gallons, will be charged for at gross weight less 25%, but not to exceed the estimated weight for a shipment of five or ten gallon capacity, respectively."

Explanation.

"Some ice cream shippers are using outside containers capable of holding five or ten gallons in shipping cans of lesser amount. Charges are computed on the capacity of the can and therefore, in the above cases, the Express Company is not obtaining its proper revenue on these shipments. The change is proposed so that the dealers who use the extra large outside container will pay for the extra weight and space."

This office has sent out two different bulletins calling the attention of members to this unfair practice of shipping three gallons of ice cream in a five gallon tub or five gallons in a ten gallon tub.

We must admit the certainty of the Interstate Commerce Commission's approvel of this item if the proposal reaches that body. It seems most unfair that a majority of our members should be exposed to the possibility of constant and expensive controversy with express agents because of the transgressions of a few shippers.

Realizing what a prolific source of trouble such an addition to the classification would be, and, in an effort to avoid this undesirable happening, President Morris, Mr. T. H. McInnerney, chairman of the Express Committee, and the Secretary, accompanied by counsel, held a conference on April 13th, in New York, with Mr. D. S. Elliott, Vice-President, and Mr. G. S. Lee, Traffic Manager of the American Railway Express Co.

We, of course, could not defend the practice mentioned above, but on our representation that it could and would be corrected through this Association, an agreement was made that the proposed classification change would be withdrawn and held in abeyance for ninety days, pending the result of our efforts to eliminate it in the industry. From the information we have we believe that the number of shippers using larger size tubs than necessary is so small that the practice can be stopped entirely.

The names of persistent offendeds in this respect will be furnished by the Express Company to this Association and that information will be passed on to the Executive Committee for such action as it may think necessary in the premises.

We must again state that it is manifestly unfair that the entire industry should be burdened with such stringent regulations because of the transgressions of a few shippers, and it is strongly urged that this practice be entirely discontinued from now on.

Billing Weight of Ice Cream.

At the above mentioned conference the subject of reducing the estimated billing weights of ice cream shipments to the old 100-lb. basis was also discussed at considerable length.

Efforts to accomplish this relief by agreement failed, but we have not lost confidence in the justice of our case and still firmly believe we are correct in our view that ice cream is discriminated against in so far as billing weights are concerned. However, it is the opinion of the Express Committee that this not the opportune time to again go before the Interstate Commerce Commission for relief, and it is thought further positive action in this respect will be deferred until the subject receives consideration at the National Convention in October.

In shipping ice cream by Express under no circumstances use a larger tub than the can requires.

T. H. McINNERNEY, Chairman, Express Company. N. LOEWENSTEIN, Secretary.

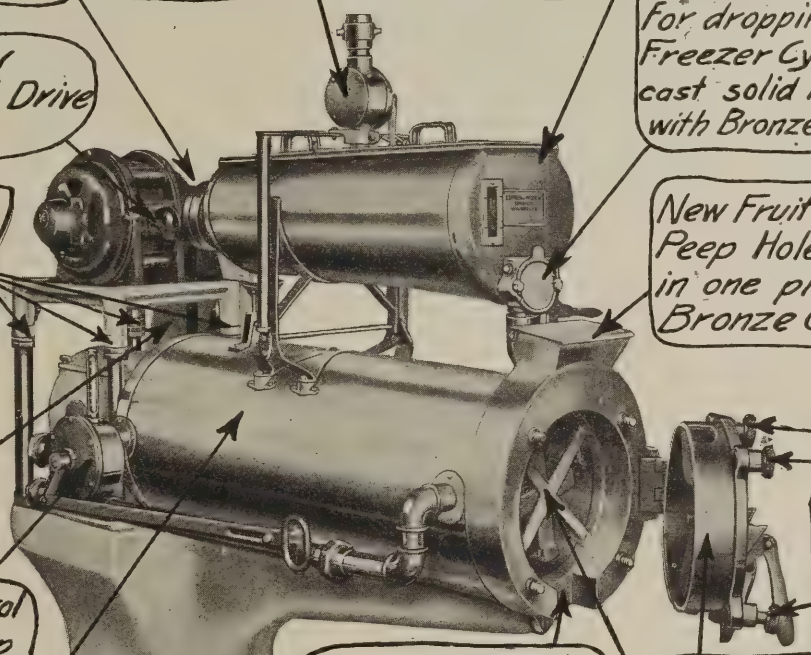
H. E. VAN NORMAN TO ATTEND GENERAL ASSEMBLY AT ROME.

U. S. Department of Agriculture Press Service.

H. E. Van Norman, president of the World's Dairy Congress Association, has been appointed Commissioner of Agriculture and Delegate of the United States to the General Assembly of the International Institute of Agriculture, which is to be held from May 8 to 12, at Rome, Italy.

Other delegates to the General Assembly previously announced are Nat C. Murray, Dr. L. C. Gray, Dr. Perley Spaulding, and Dr. H. H. Kimball, of the United States Department of Agriculture in Washington; E. A. Foley, Agricultural Commissioner for the Department at London; L. G. Michael, Representative of the Department at Budapest; Dr. W. H. Stevenson, Permanent Delegate to the institute at Rome; Dr. J. G. Lipman, Director of the New Jersey Agricultural Experiment Station; Mrs. Charlotte B. Ware, Consultant in Agriculture, Boston, and Francis B. Keene, United States Consul General at Rome.

While in Europe Dr. Van Norman will make observations as to dairy conditions. Accompanied by Mrs. Van Norman, he sailed from New York on April 22nd. Immediately following the Institute meeting, they will visit Switzerland, France, Belgium, Holland, Denmark, Germany, Sweden, Norway, and the British Isles. In each of these countries Dr. Van Norman will call upon government officials, scientists, industrial leaders, and child and social welfare workers to discuss plans for the World's Dairy Congress. He will return early in July.



The World's Dairy Congress is expected to attract much attention in Europe, as it will be the first international dairy meeting to be held in the United States, and of broader scope than any similar meeting held anywhere. It was provided for by the Federal Agricultural Act, approved March 3, 1921, which authorized the President of the United States to invite foreign governments to send representatives. The city in which the Congress and show will be held has not been selected.

Anyone who studies the advertisements in this paper does not have to be told that it is a profitbale habit. He collects the profits daily.

U. S. Heavy Duty Freezers

No Others Offer Such Advantages!

Weights on Automatic Batch Weigher – Adjusted to establish Weight of Mix in each Batch.

Main Rotary Disc Cream Valve, mechanically operated by Automatic Batch Weigher Reservoir.

Cream Can made with Solid Cast Bronze Ends.

Rotary Disc Cream Valve for dropping batch into Freezer Cylinder. Housing cast solid in one piece with Bronze End of Can.

Motor Drive – Easily Converted to Belt Drive and vice versa.

Motor Table Easily Adjusted by turning lock nuts on Four pillars to take up slack in driving chain.

New Fruit Hopper and Peep Hole cast solid in one piece with Bronze Cylinder End.

Chain Guard with Chain running in oil, also insures lubrication of Chain Gears.

Four Nickle Plated Knurled Hand Nuts – Always remain in place.

Rotary Disc Brine Control Valve – Won't leak, creep or stick – Controlled from Front end of Freezer by means of rod.

Rapid Vertical Discharge Opening.

Hinged Cylinder Cover.

Patented Removable Bronze Bearing and Support, independent of Cover for front end of Dasher.

Cylinder easy to take apart – Has no soldered joints to leak.

Base and Gear Box Finished in beautiful baked White Enamel – All other parts Nickle Finish.

U. S. Heavy Duty Freezers are made in the Largest Variety of Sizes ever offered – 40, 50, 60, 80, 100, 120, 140 and 160 Qt. Capacities – With or Without Roller Bearings. Whipping Device of Most Approved Double Dasher Type – Easily Removed and Replaced. Shafts and Gears of Finest Materials – Extra Heavy Construction – Accurately Machined.

A REALLY HEAVY DUTY FREEZER THROUGHOUT.

INGREDIENTS FOR GOOD ICE CREAM CAN'T BE TOO GOOD.

Interpretative Slogan Announced for National Exposition

Supply Men Already Working Hard for Great Cleveland Week—Believe Industry Has Entered New National Phase

A SLOGAN for the great National Exposition for the ice cream industry in Cleveland next fall has been announced:

"ICE CREAM—A NATIONAL INDUSTRY—Come to Cleveland, October 16-21."

This slogan has been determined upon by The Association of Ice Cream Supply Men, which, after holding six large successful regional exhibitions within the last three years, is now directing plans for a mammoth National Exposition for the industry in conjunction with the Twenty-second Annual Convention of the National Association of Ice Cream Manufacturers next fall.

"This slogan is neither a group of meaningless words nor a mere catchy line," according to O. S. Jordan, president of the Association. "It has a real interpretative and descriptive significance because ice cream **is** a national industry. It extends from coast to coast, from Northern Canada to below the Mexican line. It is just as national as the House of Representatives. It is everywhere.

"Many of those engaged in it, because of the necessity of keeping their minds on their own individual problems, seldom if ever thing of it as such, however. They do not stop to realize that if the industry were not so nationally extensive their own individual activities would of necessity be that much smaller. They do not, some of them, always have time to stop to think that they are, in a large degree—just as is the case in every great industry — making money on the strength of developments, inventions, experiments and experiences of some other man or men in business perhaps 3,000 miles away or perhaps antedating them by five or ten years, but who also are or have been a part of their big national industry.

"Our Association believes that the great week in Cleveland, combining, as it will, a convention of the National Association of Ice Cream Manufacturers and a National Exposition for the ice cream industry will give the great emphasis of action to the fact that all persons engaged in or dependent upon the manufacture of ice cream in any way are part of what has now become literally a **national** industry and that the individual problems of all these persons merge in the end into the national problems coming to the industry as a whole."

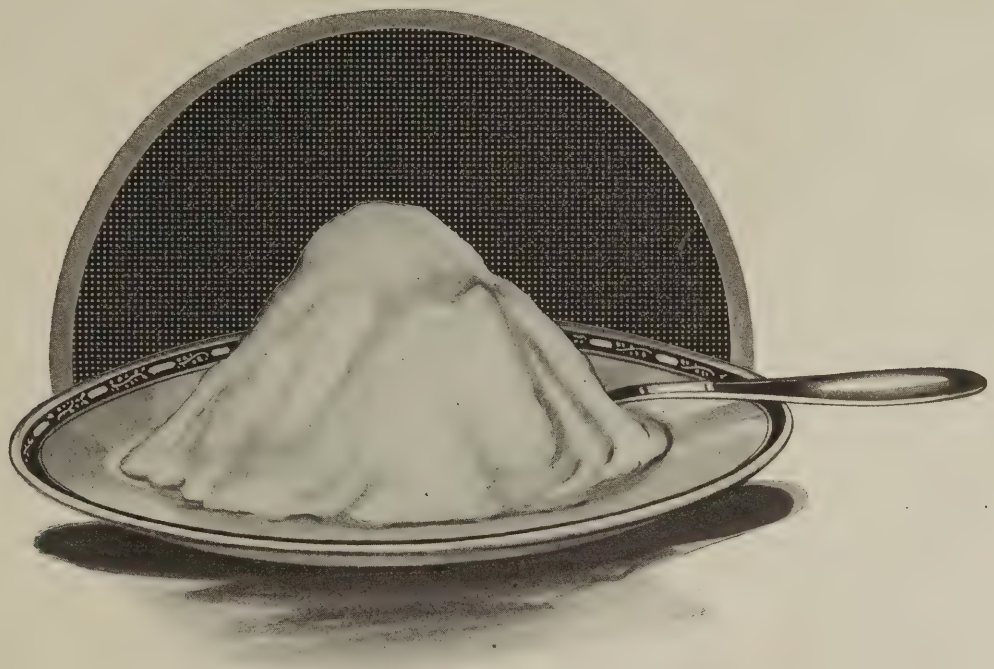
According to the Salesmen's Club of the Association, which has 500 members entering every county in every state in the United States and the Canadian provinces sometime during each season, and all of whom are now campaigning for attendance at the great industrial week in Cleveland, this slogan has still another meaning, and one that every ice cream manufacturer can afford to bear in mind in the advertising of his own individual business.

A confidential bulletin of the Salesmen's Club, issued late in April, and for the reproduction of a part of which permission has been received, says of this slogan:

"Ice cream is a national industry in the sense that it goes from coast to coast, from boundary to boundary. Geographically, ice cream stakes its limits no less widely than the country itself does.

"But ice cream is a national industry in another sense as well. It is an indigenous industry. It began in, it grew in, it belongs to just one country—this one. Europe produced the Kaiser, the bull-fight and a philosophy of nations based on a balance of power. This country has produced baseball, practical democracy—and ice cream.

"Ice cream is **the** national industry. It is just as national as George Washington or Abraham Lincoln. Every American child learns ice cream before he learns who discovered his continent. Sir Walter Raleigh found tobacco when he came to America. His countrymen, when they come today, find soda fountains. Histories carry pages telling of two great American contributions to the commodities of the world—Indian corn and tobacco. Ice cream is just as solely, as truly, as representatively and as affectionately an American commodity as either of these. Ice cream is a **national** industry—**the** national industry."



As to the Exhibition itself, the Association of Ice Cream Supply Men is perfecting the minutest arrangements for its great show, which will be held in the magnificent new $6,000,000 Public Hall, a part of a gigantic Cleveland civic development centering around the Mall in the very heart of Cleveland's business section and within two or three minutes' walk of the principal hotels —within two minutes' walk of the Hollenden in which the convention sessions of the National Association will be held.

The plans for the exposition provide for net display space exceeding by 50 per cent the space occupied at the Eastern Regional Exhibition in Buffalo last fall which accommodated 150 booths. Slightly more than half the membership of the Association has already requested the tentative reservation of square footage exceeding by 12 per cent the total display space used at this 1921 Buffalo Exhibition, apparently indicating that Association members will occupy practically all of the space, it being a settled policy of the Association, in fairness to its own members, to take care of their display requirements first, regardless of the size of space each member may desire.

Some very interesting comment and observation on the recent and present growth and status of the ice cream industry are contained in a Confidential Printed Bulletin issued by the Association to its members recently, a part of which has been released for general publication and reads:

"Like many other businesses, the commercial ice cream business since the beginning of the European war has become more and more self-conscious. The war accelerated two tendencies in modern industry: a realization of the minute interaction of all business and all economic groups; and a closer internal knitting together of each separate industry to better solve production problems and to protect and develop markets, legislative interests, etc., etc.

"The ice cream industry has come, for example, to know more today of its inter-relations with the milk, sugar, steel, lumber, tin and salt industries, with the

The Final Touch—

that delicate, delightful, dainty Vanilla Flavor in your ice cream comes only from using high-grade, quality flavor. Hudson's Vanilla Flavors are used by those ice cream manufacturers who put quality before price — because they know from experience that it's a wise thing to do.

Hudson's Vanilla Flavor will not freeze out. It retains its original flavor, always good to the last.

progress of food chemistry and of engineering science and with merchandising resourcefulness, as well as with major national and international political and economic conditions, than it ever did before. Individual ice cream manufacturers, as well as the industry as a whole, have a broader understanding of the part played by the ice cream industry in the general economic scheme.

"Equally, however, the ice cream industry represents the trend of the times in that its manufactures also have come to appreciate specifically the particular and definite problems of their own business. Their interest in and understanding of the production and marketing of ice cream are more scientific and direct. In such times as these of industrial unbalance, abnormal inter-relations of supply and demand, of changing levels of wealth and shifting business dominance, ice cream manufacturers, in order to arrive at and maintain the most practical methods of production, to protect their present investments, and to expand their further field, have been compelled, in the mere survival of the fittest, to consider themselves more and more consciously as constituting a separate, well-defined industry, interrelated with many other industries, but an independent unit, nevertheless."

The Association of Ice Cream Supply Men's hotel headquarters in Cleveland for the big industrial week will be the Winton, East 9th and Prospect Streets.

WEIGHT OF MILK AND CREAM.

The following table taken from Bulletin 98 of the United States department of agriculture, shows the variations in weights of milk from skim milk to 40 per cent cream, as worked out by the Bureau of Standards in connection with the dairy division. Of course it is understood that the milk varies continually in some of its ingredients and yet remains normal, hence, any figures showing exact weights are general:

Milk and Cream Weight Per Gallon.

Per cent		Pounds
.02	skim	8.63
3.00	milk	8.6
3.5	milk	8.59
4.0	milk	8.58
5.0	milk	8.58
6.0	milk	8.57
10.0	modified	8.53
12.0	cream	8.5
15.0	cream	8.47
20.0	cream	8.43
25.0	cream	8.39
35.0	cream	8.31
40.0	cream	8.28

PFAUDLER'S NEW YORK OFFICE CHANGES QUARTERS.

The Pfaudler Company, of New York City, has recently abandoned their old quarters and are now located at 8 West 40th St., Room 1103. They moved from their former location at 1802 World's Tower Building, 110 West 40th St., around the first of the month.

COMPOSITION OF SKIMMED MILK AND CREAM.

	Water	Fat	Casein	Albumin	Milk Sugar	Ash
Skim milk..	90.5	.3	Total Protein 3.4		5.1	.7
Cream	63.74	30.0	1.94	.51	3.24	.53
Cream	72.84	20.0	2.21	.59	3.75	.61

SPEAKING OF CONVENTIONS.

To the Members of National Association of Ice Cream Manufacturers:

From time immemorial men and women have gathered together for the interchange of thought and ideas looking toward their mutual welfare and advancement. Notable among such gatherings, and probably the first on record, is that presided over by old Father Noah, which, after many days, took final adjournment to Mount Ararat. Organization in this case certainly saved the day.

Coming down a little farther in history,, we find Benjamin Franklin advising the Continental Congress to hang together, or they would probably hang separately. The fact that his advice was followed is indicated by the wonderful organization America is today.

A more modern instance of all-important gatherings is the Limitation of Armament Conference just closed, undoubtedly the greatest international convention of all time. And this brings us to the gist of our letter—the announcement of a gathering that we believe is going to be historical in the annals of our own organization.

The 22nd Annual Convention of
The National Association of Ice Cream Manufacturers
will be held at Cleveland, Ohio,
Hotel Hollenden,
October 16, 17, 18, 1922,

and on the same dates the Association of Ice Cream Supply Men will put on an exhibit of ice cream machinery and supplies that will be most complete in every respect.

Three hundred rooms have been reserved at the Hollenden Hotel for the use of ice cream manufacturers. To be assured of the most desirable rooms it is suggested that you make your reservation immediately, and forwarding direct to the Hollenden Hotel.

Application for reduced rates is being made and we shall probably be granted the same concession as last year—fare and one-half for the round trip.

The Program Committee is already at work, and you are requested to advise this office as to any suggestions you may have to offer along this line. If there is any subject in which you have a particular interest and that you would like to have taken up, now is the time to mention it and your expressions will be gladly received.

In the meantime just jot down on your calendar the dates—October 16th, 17th and 18th—and make up your mind that you are going to be there.

The benefit of breaking away from home environment and seeing new things, meeting new and old friends, is refreshing and stimulating and leads to progress. And in these days—even more so than in the days of Noah and Franklin—the more closely bound together an organization is the more effective and far-reaching is the good it can accomplish, both for the individual and for the industry at large. By all means plan to attend this convention.

C. G. MORRIS, President. N. LOEWENSTEIN, Secretary.

Take off your Hat to the Greatest Ice Cream Brine Freezer Ever Built!

The "Cherry"

80-Quart

ITS massive beauty makes every other brine freezer look cheap, and tawdry.

It is an engineering *masterpiece* built like a machine gun, with equal insistence and precision in every detail of workmanship.

Alloy steel, phosphor bronze, cast brass, rolled copper, and nickel silver are among the materials used—every part made from the metal best adapted to that service without regard to cost.

Driving Mechanism. Totally enclosed cut gears are made of alloy steel.

SKF self-aligning ball bearings are used, (five of them). The only freezer in which they will be found.

Outer Cylinder—a seamless copper tube, nickel plated and securely flanged into front and rear heads.

Brine Cylinder—a 42 oz. copper tube, separated from outer cylinder by a 1 inch layer of insulation. Joints hermetically sealed and leak-proof.

Inner Cylinder—a welded tube made of a heavy sheet of nickel silver. It is fitted with brass baffles set like the threads of a screw and machined so as to fit snugly the 19/32 inch brine-space between the inner and outer cylinders. Brine has to travel round and round, from end to end—a long journey, in which its refrigeration is put to efficient use.

This cylinder is readily removable, giving access to brine space.

Freezing chamber. Holds 111.8 quarts without the dasher, or 106.6 quarts with dasher. But we rate this machine as 80 quarts capacity.

Dasher—made of phosphor bronze and cast brass. Its special design including its 45 degree scrapers, insures quick unloading, while a clutch mechanism prevents sticking when dasher is taken out.

Beaters. Sixteen blades set at an angle of 70 degrees, 1½ inches apart. They assure quick freezing and shipping.

Outlet Gate. Disc and handle in one piece and held against the machined edge of the outlet with 4 "Belleville Washers" or springs, such as used in the recoil mechanism of the French 75 mm guns.

For hundreds of other vital and important features of this truly remarkable machine, consult a "Cherry" Salesman or send for our new Bulletin, just off the press.

"U. S. GEL"

WORLD'S LARGEST INDIVIDUAL GELATINE FACTORY

UNITED STATES GELATINE CO.

MILWAUKEE, WIS.

U.S. Gelatine is produced in the World's Largest Gelatine Factory, which means Uniformity, Purity, Strength at the Right Price. Stock used in the manufacture assures a bright, clean, odorless Gelatine. Its use means a smooth, high quality and superior texture Ice Cream.

LET US SEND YOU SAMPLES AND QUOTE ON YOUR REQUIREMENTS

FROM GENERAL MANAGER SKINNER.

Chicago, Ill., April 13, 1922.

Governor R. A. Nestos, of North Dakota, realizing hat the agriculture of that State requires diversification and that the dairy cow is important to the success f their agriculture, called a meeting of farmers and usiness men for Bismarck, on March 28. The result was he formation of a committee to carry on an intensive ampaign for dairying throughout the year, culminating n gathering together delegations of farmers, cattle reeders, creamery men and milk dealers from all parts f the state for the purpose of attending the National)airy Show in large numbers this fall.

South Dakota, through its State Dairymen's Asso- iation, organized a similar committee under the patron- ge of Governor McMasters, who accepted the chairman- hip at the annual meeting of that association held at Huron, S. D., March 29th and 30th. On the evening of pril 1st the Sioux Falls Chamber of Commerce held a oint meeting of farmers, cattle breeders, milk and reamery men, merchants and bankers of their part of heir state to begin a forceful dairy program for the ear and a big round-up at the time of the Show. On pril 3rd a conference was held at Ames, Iowa, by the ollege and state leaders of agricultural work in that tate, and a committee named to inform the farming and airy interests of the state about the Show being held n the Northwest, to insure their taking advantage of 's close proximity and attending it.

The General Manager of the Show was present at all these meetings and never before attended such en- usiastic meetings. Wisconsin is in action through ate dairy leaders, creamery owners and breeders, in an ffort to double the attendance this year from that great airy state, and Minnesota has a committee of thirty, ith Governor Preus at the head, ten from St. Paul, ten om Minneapolis, and ten from the state at large, made o of the biggest business leaders and leaders of agri- ltural work of the state. This committee is already action organizing all factors for the purpose of mak- g a drive that will bring their whole agricultural and airy interests to our Show, as also their business people.

This all calls for us to be a part of the greatest edu- tional dairy show yet held and to arrange exhibits at will make the utmost impression upon the visitors the magnitude and importance of this industry.

Many new features are to be added to the Show for e benefit of the farmers and consuming public partic- arly, and we all should feel a responsibility to do our st for this growing and permanent natural dairy coun- y of the Northwest.

Yours very truly,

W. E. SKINNER,
General Manager.

The Vacuum Pan in the Ice Cream Plant

By H. J. LIEDEL, Mojonnier Bros., Chicago.

EVERY manufacturer of ice cream is interested in making a better product, and it is this desire on the part of the manufacturers to constantly improve the quality of ice cream that has caused the industry to grow from an annual output of 154,000,000 gallons in 1912 to 258,000,000 gallons in 1920. When it is possible to produce not only a better flavored product but to do this at a lower cost the manufacturer is naturally doubly interested. It has been found in actual practice that this is readily possible with the aid of a vacuum pan.

The question immediately arises as to why ice cream made in a vacuum pan should be any better in flavor and texture. Everyone who has been connected at some time with a condensed milk plant knows that often whole milk is taken in, which has bad-off-flavors and that these off-flavors are not apparent in the finished product having been entirely removed in the condensing process. This is due to the violent boiling to which the milk is subjected under vacuum, the maximum temperature being 140 degrees Fahrenheit or less during the entire process since the boiling point of water is 140 F. in a vacuum of 24 inches of mercury and in a vacuum pan this vacuum or higher is easily obtained. In making ice cream in a vacuum pan any off-flavors present in the raw materials are removed in the same way, and also a better flavor is assured because the raw materials used are fresher and the condensation is much less than the condensation of condensed milk ordinarily used, eliminating any possibility of a condensed milk flavor. That a better flavored and cleaner product is produced by this method has been proven in actual practice since it has been found that only two-thirds the amount of flavoring formerly used is now necessary since all the flavoring added acts as a flavor, and not as a neutralizer to counteract off-flavors.

1.—Mojonnier Vacuum Condensing Unit (5') in plant of Lawrence Ice Cream Co., Chicago. Temperature of milk never exceeds 140° either in hot wells or vacuum pan.

However, of equal or greater importance, is the decrease in costs. If every manufacturer could cut down the cost of his mix nine cents per gallon, the cost would in many cases be reduced 25 per cent and in some cases more. In other words, what figure multiplied by nine represents the cost of your mix per gallon? Not many multiples to be sure so that a saving of this amount is a matter of vital importance at a time when the margin of profit is decreasing and competition increasing. This large reduction in cost per gallon is assured when the mix is prepared in the vacuum pan because of the following reasons. The solids not fat are obtained from the product in which they are by far the cheapest, namely, fresh milk. Sweet butter is used to make up the shortage in butterfat, and during the summer months when ice cream production is at its peak, butter prices are the lowest. Also the raw materials used are handled once only, since pasteurization, condensation, standardization and mixing are all thoroughly accomplished in one operation and the labor required is n more than in the pasteurizing process. In Formula N 1 the amounts of raw materials required to make 90 pounds or 100 gallons of finished mix is given followe by the calculations involved in arriving at these figure

From Formula No. 1 it can be seen that the calc lations required for figuring a mix of this kind a relatively simple and by following the same procedur it is possible to obtain the amounts required for mix of any composition desired, also the cost of the m per gallon which will show the saving under local cond tions over the present cost. Cases will arise, howeve when sweet butter is not available in which case 20 p cent cream would probably be used and Formula No. is for a mix making up the fat shortage with 20 per ce cream and shows amounts required for 900 pounds 100 gallons finished mix.

In making up the mix the required amount of wh milk is run into the hot wells, the pasteurizer formerly used f mixing will do just as well, t butter or cream is added, and t weighed sugar and gelati poured in. The mix is th heated to 145 degrees F. T mix can be accurately standar ized at this point by getting t ratio of fat to solids exactly t same as the ratio of the fat solids desired in the finished mi The mix is quickly drawn in the pan, the water removed a the finished mix dropped into drop tank. From here the m is run through the Viscolizer Homogenizer over the cooler to the holding tanks ready to frozen. It will be noted that mix made through the pan w have a greater viscosity, all oth conditions being equal, than o which is not and it is therefo easier to obtain the desired ov run. In most cases where a p is installed, very few changes necessary since the equipment already in use is all t is needed with the exception of the vacuum pan its the vacuum pump and possibly the hot wells. No ad tion in the labor force is necessary since the us number can handle the processing, and the operation a pan can be learned in a few hours.

In addition to proving a valuable asset in procuri a better mix, the vacuum pan always offers an out for surplus milk enabling the manufacturer to turn skimmilk into sweetened condensed milk which w keep for many months, and can be turned back i ice cream or sold on the market. Any possibility waste or loss due to running solids down the sewer a having to buy them later is eliminated.

In order that any amount of ice cream and m may be readily handled the vacuum pan is made various sizes to meet any requirements ranging fr the 3 foot size, having a capacity of 185 gallons finish mix per hour to the 7 foot size having a capacity 1140 gallons per hour finished mix.

(Continued on page 24)

Of Special interest to users of gelatin

That quality of product which has long been associated with the name of Swift & Company now applies to a complete line of gelatin.

And it is significant that the leadership which is granted to other Swift products is fast coming to these gelatins which have been on the market little more than a year.

The reason, however, is plain. In these gelatins, as in the other Swift products, superior quality is achieved by greater care in every detail of preparation,

Even the air is washed

It is not enough for us to have an abundant supply of raw materials from which only the best need be chosen, or to have the most modern equipment for experienced men to use in making the finished product.

Absolute sanitation is the watchword in every step of the process. The air, for instance, which goes into the factory where Swift & Company's Gelatins are made, is thoroughly washed in pure spring water.

So it is that we can offer you gelatins, pure, free from taste and odor, of good strength, unusual clarity and dependable uniformity.

The prices will interest you.

Quick service from nearby warehouses

The quickest deliveries are assured through our established system of warehouses in all parts of the country.

Makers of ice cream, marshmallows or icings, particularly those who recognize the value of purity and quality in their products, are invited to write for samples and quotations on the different grades.

Or, upon request, one of our representatives will call. Address Dept. 6-A.

Swift & Company

Chicago

THE ASSOCIATION OF ICE CREAM SUPPLY MEN MEMBER

From the results obtained by this method, it is natural to expect that the vacuum pan, which has been identified with the dairy industry since its earliest days, will prove as necessary to the ice cream plant as it has to other branches of the industry and this is rapidly being demonstrated by the large number in operation at the present time and they will continue to demonstrate it by giving a lifetime of service.

Formula No. 1.

10% Fat, 14% Sugar, 35% Total Solids.

1098.0 lbs. whole milk, 4% fat, 12.6% total solids.
55.5 lbs. butter, 83 % fat, 84.5% total solids.
5.2lbs. gelatine.
126.0 lbs. sugar.

1284.7 lbs.
384.7 lbs. water to be evaporated.

900.0 lbs. finished mix.

The evaporation of this amount of water requires about 48 lbs. of coal and 750 gallons of 60 degree water.

Calculations.

35% total solids — (10% fat + 14% sugar + .5% gelatine) = 10.5% milk solids not fat.
.105 × 900 = 94.5 lbs. milk solids not fat required.
94.5 ÷ .086 (S. N. F. test of whole milk) = 1098 lbs. whole milk required to make up milk solids not fat.
1098 × .04 (fattest of whole milk) = 43.9 lbs. butterfat in whole milk.
900 × .10 = 90 lbs. butterfat required.
90 — 43.9 = 46.1 lbs. butterfat short.
46.1 ÷ .83 (fat test of butter) = 55.5 lbs. butter required.
.14 × 900 = 126 lbs. sugar.
.005 × 900 = 4.5 ÷ .87 = 5.2 lbs. gelatine (87% solids).
Solids not fat in butter disregarded.

Formula No. 2.

10% Fat, 14% Sugar, 35% Total Solids.

880.0 lbs. whole milk, 4% fat, 12.6% total solids.
275.0 lbs. 20% cream, 20% fat, 27% total solids.
126.0 lbs. sugar.
5.2 lbs. gelatine.

1286.2 lbs.
386.2 lbs. water to be evaporated.

900.0 lbs. finished mix.

Same amount of coal and water is required as in Formula
.10 × 900 = 90 lbs. butterfat required.
.14 × 900 = 126 lbs. sugar.
.005 × 900 = 4.5 ÷ .87 = 5.2 lbs. gelatine (87% solid
.105 × 900 = 94.5 lbs. milk solids not fat required.

Let X represent pounds of milk required and Y rep sent pounds of cream.

.04 X + .20 Y = 90 lbs.
.086 X + .07 Y = 94.5 lbs.
X = 880 lbs. whole milk.
Y = 275 lbs. cream.

With the aid of a slide rule the calculations are grea simplified and reduced.

Mixing Room at plant of R. E. Rakestraw, Mechanicsburg, Pennsylvania

Pfaudler

An Ideal Plant—

THIS is by no means the *largest* plant we have equipped, but in many respects it is one of the most ideal. Note the light, airy mixing room, the complete absence of shafting and excess piping—the general sanitary appearance. Pfaudler Batch-Mixer and Pasteurizer appears in foreground—in the rear two Aging Tanks, which are suspended directly over freezers on floor below. The plant handles 1000 to 1500 gallons of cream daily.

If you reside in Pennsylvania, near Mechanicsburg, we suggest that you run over to see Mr. Rakestraw, who will be glad to show you his plant. Incidentally, it may help you make your decision on equipment.

Mail the coupon for a proposed plan of operation, stating daily capacity.

NATIONAL DAIRY COUNCIL EDUCATIONAL CONFERENCE.

The National Dairy Council office in Chicago was the meeting place recently of an enthusiastic group made up of 19 men and women leaders from the various District Dairy Councils affiliated with the National Dairy Council. These people assisted by local paid workers have successfully carried on milk campaigns in over one hundred cities and communities during the past year. The meeting was especially worth while in that it afforded the opportunity to talk over future plans and exchange ideas as to the best method of emphasizing the importance of dairy products in everyone's diet.

Several new pieces of literature for use in educational work were adopted. One of the most interesting was the "Mother Goose Milk Rhymes." These rhymes were composed by the children of Walton School, Philadelphia, and have been assembled in a booklet, along with attractive outline illustrations which are to be colored by the children while they are learning the story of milk from the "Mother Goose" jingles. This booklet will be distributed widely among the children of the country.

"The Old Woman in the Shoe," a cut out puzzle for children, shows the old woman surrounded by her healthy brood after she has moved from the old shoe into the shiny new milk bottle home. This cutout puzzle will be used widely in milk campaigns and will also be sold to dealers.

Several new three color posters for schools, showing milk serving and the importance of milk in bringing children up to proper weight, were decided upon. A poster for use in factories entitled, "Milk Puts Power Behind the Blow," and reproductions in miniature of the series of National Dairy Council billboard posters will be ready within the next few months.

A new motion picture entitled, "Highland Lassie," depicting the care exercised in handling milk and emphasizing how many processes it goes through and yet reaches the consumer at a reasonable price will be added to the film library of the Council.

Plans for work during the summer months in all the campaigns were discussed. A special drive will be made to increase consumption of milk drinks at soda fountains and to teach the value to restaurants of dairy products for summer time menus. Some cities are planning to do considerable educational work in play grounds and establish the serving of milk.

Some interesting side-lights on the success of educational work as carried on by the National Dairy Council were brought out at the meeting.

The Philadelphia Inter-State Dairy Council is carrying on work in the City of Philadelphia and is also meeting the demand from both the rural and urban communities of the entire Philadelphia milk shed area.

During the past year, educational work was carried on in Wilmington, Del., Atlantic City, N. J., Harrisburg, Lancaster, Johnstown, Trenton and many other cities.

That the Philadelphia Council is carrying its message home is best shown by the fact that despite industrial depression, the retail sales of milk in Philadelphia last year directly traceable to the educational work which has been done were increased 14 per cent.

The Baltimore Dairy Council has been successful in promoting the serving of milk in all the schools of Baltimore. The Council is carrying out its work according to a plan which has the approval of Dr. E. V. McCollum of Johns Hopkins University.

The New England Dairy and Food Council is reaching all parts of New England with the message of "Milk for Health." Some especially far reaching work is being done in Boston with groups of Italians, Polish and other foreigners in teaching them how to use more dairy products. A number of foreign workers are employed for this purpose.

The Pittsburgh District Dairy Council began permanent educational work in Pittsburgh January 1st. The Milk Fairy Play is being produced throughout the city and splendid co-operation is being given by the leading health agencies and women's clubs. An increase in the consumption of milk is already noticeable.

Columbus, O., is another city which has started, during the last thirty days, to carry on an educational milk campaign. The local parent-teachers organization is fostering the program and plans are being made to introduce the serving of milk into every school in the city.

Cleveland "Milk for Health" campaign has been one of the means of increasing milk consumption there to a remarkable extent. A special feature of the work there is the animal feeding experiments based upon diets supplied by Dr. McCollum. Window displays of chickens and animals which have been fed during the growing period on proper and improper food show by contrast in a telling manner the relation of food, and especially dairy products, to growth and physical efficiency.

The food budget lessons are unique in the Cleveland campaign. Two thousand woman leaders, enrolled in classes of from 5 to 15 attended the course of six food budget lessons this winter. These women in turn taught other women in their communities what they had

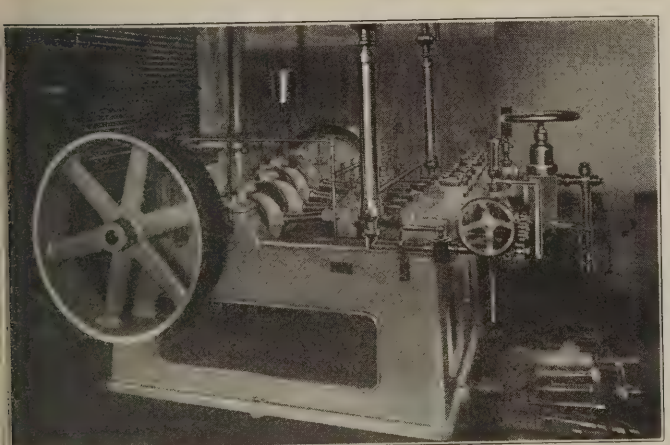
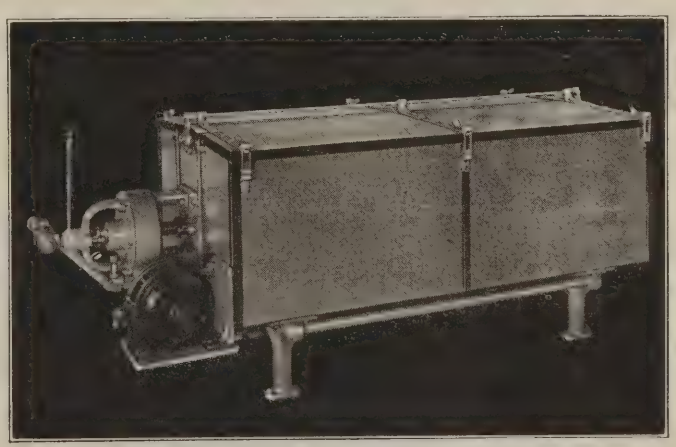
Dairymen's Memphis Can.



"PROGRESS" is the one word in the Ice Cream Manufacturers' vocabulary which really characterizes that particular business. It is also the trade name of this line of machinery, so familiar to ice cream men everywhere. It is truly the Dominating name of the ice cream industry. And, the machinery it designates is popular because of its sterling worth and value.

It is customary, in this day and age, for price to indicate quality. This is because few of us have the knowledge which will permit us to correctly judge quality, except by price. Trade names are also excellent indicators of quality. "Progress" is a trade name belonging to the Davis-Watkins organization. They are in duty bound to protect its reputation. And, this is an item of protection no careful buyer ever overlooks.



The Davis-Watkins Dairymen's Mfg. Co. is more firmly entrenched in the ice cream industry of America than some of us have understood. In the factories of this great organization ice cream equipment is an important item. Millions of dollars worth are turned out each year. Few ice cream plants in the world are without some of the Davis-Watkins machinery or equipment. And, many of them are completely equipped with it.

GOOD BOOKS WILL ASSIST IN IMPROVED METHODS IN EVERY MARKETABLE LINE.

learned. The lessons were given by six trained home economics demonstrators in all parts of the city.

The milk campaigns in St. Paul and Minneapolis, Minn., have been in progress since before the 1921 dairy show. In St. Paul the women's organizations of the city co-operating with the National Dairy Council recently held their first annual Child Health Day. About 15,000 people attended the meeting during the day. The program will be made an annual affair in St. Paul and will be duplicated by the National Dairy Council in other cities where educational work is carried on.

Minneapolis is finding their "chalk talk" man, who tells the story of milk through a series of cartoons, very instructive and interesting. Both cities are making elaborate plans to participate in the National Dairy Show again this year and to feature Child Health demonstrations under the auspices of the health organizations of the two cities.

The recent meeting in Chicago afforded all the National Dairy Council and District Dairy Council people present, the opportunity to realize the far reaching results that have been obtained from milk campaigns developed in co-operation with educational departments of cities. It was the consensus opinion that no better slogan could be brought to the attention of parents during the coming year than "It is a sacred right of your children to be as healthy as knowledge can make them," and along with this message to show the vital and necessary part that dairy products have in developing happy, healthy children.

$300,000 COMPANY FORMED TO MAKE SUNDAE-ETTES.

Following the introduction of the Sundae-Ette in Pennsylvania by Mr. H. L. Carpenter only a few weeks ago, comes the announcement that a company capitalized at $300,000, for the manufacture and distribution of this confection, has been formed in Connellsville. This company will be known as the Tri-State Sundae-Ette Company, and will have territorial rights covering the states of Pennsylvania, West Virginia, Maryland, New Jersey and the District of Columbia.

The board of directors of the company is composed of H. L. Carpenter, R. D. Henry, Frank A. Tarr, C. E. Wilson, William Wishart, J. H. Richter and S. J. I. Morningstar. Officers are H. L. Carpenter, president; R. D. Henry, vice-president; Frank A. Tarr, treasurer, and J. H. Richter, secretary. The company has opened offices in the Citizens' National Bank Building at Connellsville.

The Sundae-Ette Company is the owner of a machine the invention of Frank Bonage, that is a new innovation in equipment for producing chocolate covered ice cream bars. A single machine handles the ice cream, puts it between sugar wafers, dips it into chocolate, and freezes ready for the market, without the touch of human hands. This machine has a capacity of more than 600 dozen a day.

A number of manufacturing plants throughout the East, one to be located at Atlantic City, will be established and operated by the company. Equipment for the Atlantic City plant has been purchased, and will be put in operation soon. A number of contracts have been closed with manufacturers in several of the large eastern towns, who are turning out thousands of the popular confection.

The immediate popularity of this new chocolate covered ice cream commodity in this vicinity indicates the possibilities of a gigantic enterprise, and, speaking in this connection, Mr. Carpenter stated that within a short time more than a million Sundae-Ettes would be turned out daily.

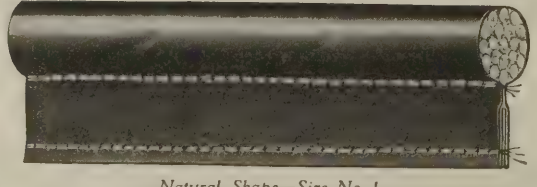
ARTCRAFT VICE-PRESIDENT JOINS FREDERICK C. MATHEWS COMPANY.

James T. Alton, vice-president of the Artcraft Lithographing Co., Detroit, and in charge of sales for that organization, has resigned to join the selling staff of Frederick C. Mathews Co.

Mr. Alton's fifteen years of sales and creative experience and his study of color in stimulative advertising fits well into the plans of the Mathews Co., who operating their own manufacturing plant, are producing by special process, a type of color printing and illustration that has met with wide approval.

Frederick Mathews in an interview stated that his company had no intention of entering the lithographic field and that Mr. Alton's connection had no significance from that angle. "Alton," said Mathews, "was selected because of his judgment and long experience in the selection and arrangement of color in display advertising.



"There has been a need in our work for seasoned well balanced men of experience, and with the great growth of our business, we have been fortunate in attracting men who, seeing its possibilities, will prove invaluable in rounding out an organization which is rendering real service to the dairy industry."

DEPENDABILITY

Hendler's Fleet of C-T Electric Trucks, Capacities 3½ and 1-ton

Walk into the electric garage of any large user of C-T's and notice how few of the electric trucks are undergoing repairs. The repair department is so small you can hardly find it.

Extensive shops and large reserves of parts are not needed to keep electric trucks on the road. It is not unusual for a C-T Electric to be run every day for a year without losing a trip because of repairs or adjustment.

C-T Electric Trucks are always ready for the road and their performance is steady and sure regardless of weather conditions.

For city deliveries, frequent stop routes or short hauls C-T Electrics will save you 25% to 50% on your delivery costs and give you dependable service every day of the year for many years.

Let us know about your particular delivery problems and we will send you complete data.

WORLD WIDE KNOWN PUBLICATIONS PRAISE THE ASSOCIATION OF ICE CREAM SUPPLY MEN.

The Association of Ice Cream Supply Men which has received editorial comment in many newspapers and periodicals within the last two years has again been honored by the attention of two publications of international circulation and the very highest prestige.

One of these publications is "The World's Work," among the foremost internationally read constructive reviews of international economics, politics and literature, of which the ex-Ambassador to the Court of St. James, Walter H. Page, was long the editor.

"The World's Work" has a monthly department known as "The Council Table," the regular directors of which include such men as Charles W. Eliot, President Emeritus, Harvard University, Edward A. Alderman, President University of Virginia, Henry Morgenthau, former Ambassador to Turkey, Wm. S. Sims, Rear Admiral, U. S. Navy, James G. Harbord, Major-General, U. S. Army, Herbert Hoover, Secretary of Commerce, Robert S. Lovett, Chairman of the Board, Union Pacific Railway System, and Henry L. Stimson, ex-Secretary of War. This department each month carries some article of opinion or fact significant of the more important social, industrial, political or national trends of the moment.

In its March issue the Council Table of "The World's Work" contains an article on "A Business Code of Ethics," by Casper C. Yost, editor of the St. Louis Globe-Democrat. Mr. Yost's article points out the gradual and recent emergence of an ethical conscience in the business of the country. Prominent in his article are the following comments:

"* * * definite ethical standards are being set up by some groups of business men. Not long ago, The Association of Ice Cream Supply Men adopted and put into operation a 'Fair Practices Code' constituting essentially a code of ethics for that particular business. The Code consists of forty rules, fourteen of which govern the relations of the members with their customers, and the others the relations of the members with one another. It applies to concerns with an invested capital of more than $100,000,000 and annual expenditures of more than $200,000,000. Violation of the Code is punished by expulsion from the Association."

"The World's Work is read by leaders of industry, diplomacy and politics in all the capitols of the world, besides enjoying a tremendous and influential circulation in the United States, Canada and Great Britain.

"The Nation's Business," organ of the Chamber of Commerce of the United States, which once before has devoted its editorial columns more or less briefly, to the Association of Ice Cream Supply Men, in an article in its April number, by Warren Bishop, on "A Midwinter Ice Cream Boom," again recognies the important place occupied by the organization in relation to the national ice cream industry.

Speaking of the chocolate coated ice cream bars, and their mid-winter vogue, Mr. Bishop's article says:

"Ice cream plants make profits in August and run into deficits in January, usually. Eskimo Pie has put many ice cream plants even with the world in winter, in the last three months. Results? The members of The Association of Ice Cream Supply Men who sell them their essential ingredients, equipment and supplies under one of the strictest codes of ethics in force today in any industry, are finding fewer accounts still open on their books of last fall's purchases. And the ice cream manufacturer buys 150 varieties of equipment and ingredient for his plant."

"The Nation's Business" as the organ of the Chamber of Commerce is read by the most important leaders of business and industry in the country.

"There are many evidences aside from these significant editorial comments of the new place the ice cream industry is gradually coming to occupy in the business consciousness of the country," according to Roberts Everett, Secretary-Manager of The Association of Ice Cream Supply Men. "It's capital investments, its ever strengthening hold upon the affections of the American public, its closer and closer tie-up with modern industrial science, in refrigeration, in bacteriology, in food chemistry, in merchandising engineering, are more and more winning it the respect and the dignity that it deserves. The day is rapidly passing when the ice cream industry can be alluded to by anyone in any but a respectful tone."

FOR LOWER SECOND CLASS POSTAGE RATES.

A movement is under way looking toward lower second class postage rates. The American Publishers' Conference, an organization supported by publishers all over the country, is pushing such a movement, and is entitled to the support of every reader of this paper. When you have read the following statement of the reasons for lower second class postage rates, just sit down and write your Congressman and United States Senators a letter, asking them to give their support to this movement. You will be contributing to a worthy cause. Below we give a brief statement of the publishers' case.

A Brief Statement of the Publishers' Case.

No country can live and grow without information highways. In many ways it is more important to provide the means for the dissemination of intelligence than for the transportation of material commodities.

For this reason the government has always recognized the necessity for low postal rates on newspapers and periodicals. During the war, however, the publications of the country were loaded with increases on the carrying charges in the mails. These increases were provided for in the Revenue Bill of 1917 and now amount to four times the pre-war charges.

While paying this excessive special tax, the publishers have been paying all other taxes of what ever kind, levied upon industry as a whole, and have had to stand and are still suffering under high costs for labor, paper and other essentials.

It is significant, too, that this special tax on the circulation of publications, is a tax on a PROCESS of the industry. It is a recognized principle of taxation that taxes should be levied on the products of industry and not on the processes. Publishers have been paying on both processes and products.

The case is not dissimilar to taxation of traveling salesmen or labor-saving machinery. Indeed the advertising pages of publications may be likened to traveling salesmen. How foolish and futile to make it difficult to get the orders which are the life blood of industry.

Every interchange of commodities must be preceded by an interchange of ideas, of information, of proposals and acceptances, and this important function of our publications needs support and encouragement at this time to build up and restore national prosperity.

We would abhor the idea of taxing schools, yet but 7 per cent of our boys and girls go beyond the grammar grades. The rest of their education must come from reading, and yet the present law is in effect a tax on this source of education which is depended upon by 93 per cent of the people to take the place of higher education.

As a result of these exorbitant postal changes, publishers have had to increase subscription rates greatly, or have ceased soliciting subscriptions from sections of the country where the high postal rates would make it unprofitable. In still other cases publishers have tried to absorb the additional costs and numbers of them have fallen by the wayside in the attempt.

In 1918, the Federal government collected from the publishers $11,712,068.18 and in the last fiscal year this had grown to $25,496,719.94. During the current year it is estimated that the publishers will pay to the government for carrying their papers the huge sum of $33,000,000.

This too, notwithstanding the fact that the high rates have forced out of the mails an enormous tonnage of newspapers and magazines which now go by express, baggage, motor truck, freight or by water for less than Uncle Sam will carry them.

Unfortunately some of the most necessary publications cannot be shpiped in bulk lots and cannot escape the back-breaking postal charges. Among this class of papers are the business and technical papers going to the retailers, factories, and professional men; the farm papers which are raising the standards of agriculture; the religious papers which promote the spiritual life of the country; the fraternal publications which bind together groups of men and women for their common good; the educational papers which carry the light of new knowledge into the humblest homes, and many others of similar kind.

The burden falls heaviest upon the smaller papers of the country, The big papers with a million or more of readers can afford to develop their own systems of transportation. It falls heavily, too, upon the readers who most need the enlightening force of good reading.

In spite of all this the publishers are most modest and moderate in their appeal. All that is asked is the repeal of the last two increases, those which went into effect in 1920 and 1921, retaining the rates in effect just prior to these increases.

This will not affect the zone system in the least, neither will it affect the present free-in-county privilege enjoyed by the smaller weeklies and dailies.

The rates asked for in the bill now proposed in Congress, would still give the government approximately **175 per cent more than the pre-war rates,** and would not relieve the publishing industry of one cent of the other Federal taxes now paid by other industries.

Here is another very important consideration—the special or super-taxes which the War Revenue bill imposed upon some ten other industries have either been taken off or materially reduced. Is it fair that the publishing industry, of all industries, should be singled out as the sole exception and compelled to stagger along under special war taxes to defray war expenses?

This seems all the more unfair, when it is remembered that the newspapers and periodicals of the country did not go over the top for pay, during the war; that they did not profiteer; that they were in no sense a war industry. On the contrary they volunteered space and services to the value of millions of dollars.

In a word what the publishers are asking, would amount in dollars and cents to a gross reduction in rates of about $8,000,000 as against total post office receipts of about $500,000,000.

Furthermore, the effect of lowering the rates would attract back into the mails enough tonnage to largely compensate for the apparent or bookkeeping loss.

Does your business pay? If not, why keep it? Advertise it For Sale in The Ice Cream Review Want Department. Some one may be glad to buy it if they only knew it was for sale.

Pacific Association of Ice Cream Manufacturers

Proceedings of Annual Convention, Seattle, Wash.

(Continued from April Issue)

Address by Mr. Harry Stokes.

Mr. Stokes: I was given the privilege of coming here again to address this association and I feel highly honored that the invitation was extended to me again.

In paying a tribute to the speakers who have preceded me I desire to say that I have been very much interested in their addresses. We all have been particularly interested in what they have said and I believe it would be more to my credit if we had adjourned this meeting at this time.

However, if you will bear with me for a few minutes I will not keep you very long.

After looking over the past season's sales I sat down one evening not long ago to collect my thoughts for some ideas on this address to you—"Creating New Business."

And, the first thought that came to me was—there hain't no such animal existing as ice cream business these cool summers. And then, I thought—well, Bert Walker must think you are some kind of a God 'cause he asked you to create it. And I was puzzled and wished I could do like a great Prince who lived in India thousands of years ago. This Prince used to call unto his God when he was in trouble, to create things for him. The legend of this Prince is—that once upon a time this great Prince was in trouble and sorely distressed because he found his followers were continually betraying him and plotting his downfall. At last he felt there was no one he could trust so in great anguish he closed his eyes and implored his God to create for him, one that would be ever faithful unto him, and when he opened his eyes he beheld a dog standing before him, trustfully, wagging his tail. Since that time we have had the ever faithful dog on earth.

One great essential for the creation of new business, gentlemen, is stop your quarreling and scheming for the other fellow's downfall. Shoot straight. Get your heads together with faith in each other, work with a common interest on plans and suggestions that will increase the demand for ice cream.

Hammer, again and again with your combined, concentrated energies to the public this fact: that ice cream is a delicious and well balanced food. That it is rich with those mysterious vitamines necessary to healthful life. That it is most healthful and should be eaten instead of meat during hot weather.

Suggestions along these lines continually presented to the public would help to a great extent to make ice cream a necessary adjunct to a daily meal and create new business for your attention instead of strife.

A great deal of success of increasing ice cream sales can be found in the spirit of co-operation which permeates manufacturers, teamwork, pulling together for the common interest of greater publicity for greater sales.

The success of any organization depends on the co-operation of its units. Modern business is based, not on the legality but on the sanctity of contracts, on the common faith that a business man will do what he promises. An atmosphere of harmony and the spirit of co-operation which rings true among manufacturers will help to increase the consumption of ice cream through united efforts. You won't get big things done in this world without friends and well wishers.

I believe we must all agree, that the greatest factor for creating business is effective advertising.

All good advertising is expensive, yet it is the best investment that a business man can possibly make.

The last generation began to feel the influence of advertising. The present generation has been brought up on it. Today people quote advertisements; they are surrounded by advertised wares; they use advertised commodities as a basis for judgment of other products.

This essential factor has resulted in the solid advancement in production of commodities of merit. We want to develop a national habit of eating ice cream daily as habit is a mighty factor in life's activities. Get the habit of eating ice cream—pound this thought again and again into the public. Don't relax when you have made your first impression. It is only a step forward. Follow it up.

The sale of ice cream, like every other article of merchandise, can be greatly increased or may remain at a standstill according to the public interest aroused in it.

It is true in order for business to grow and render a real and continued service. It must make a profit, and if you want to be sure of making a profit, charge it in your price.

Many are of the opinion that the present price is too high for wide consumption, as a lower price would be a great incentive to the public to eat more ice cream; and this would increase the volume which cuts such a tremendous figure in costs.

I do not believe in the theory sometimes expressed that we should never lower our prices, but on the con-

Next month—a letter from an Iowa creameryman, who has used the Manning for five years.

The Gassmann Ice Cream Co.

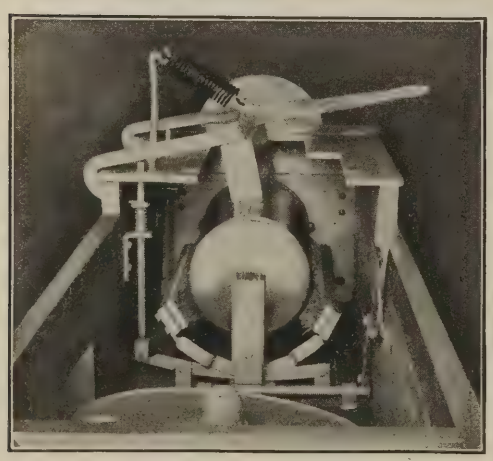
ICE CREAM, CONES, FRUITS, SYRUPS, AND FOUNTAIN SPECIALTIES

OLNEY, ILLINOIS
15 November 1921.

Manning Manufacturing Co.,
Rutland, Vt.

Gentlemen;

The Manning Ice Cream Can Washer which we installed in our plant almost two years ago has given entire satisfaction.



The machine is a money saver as it permits one man to do the work formerly done by three men, and do it better. Its rugged mechanical construction makes it fool proof and trouble proof; the brushes are long lasting.

We know of no better recommendation than to say that if we were buying another can washer it would be a "Manning".

Wishing you success, we are

Yours very truly,
THE GASSMANN ICE CREAM CO.
President.

trary, believe that we should try at all times to reduce prices to a legitimate business profit.

On the other hand, it is not good business or good morals for a man to sell goods for less than actual costs delivered. Such a manufacturer cannot do business on this basis. He is unjust to his family and his creditors.

We all want to build up and improve our business; we want to keep adding to our plants those improvements that modern times require, and to do these things it is necessary to get for our products a legitimate profit.

For a time you may sell goods at a price above what they are worth and for a time you may be compelled to pay for the production of goods more than the goods are worth—but eventually, just as water finds its level—the economic chart will show a line curving back to normalcy.

I have never heard of there being a profiteer in this association but many times it has been a case of being a high financier to keep clear from the red side of the ledger.

We in the northwest with our short seasons and high service costs, cannot figure much on creating new business through a reduction in price, while confronted with present high costs and high fat standard of 12 per cent required in Seattle.

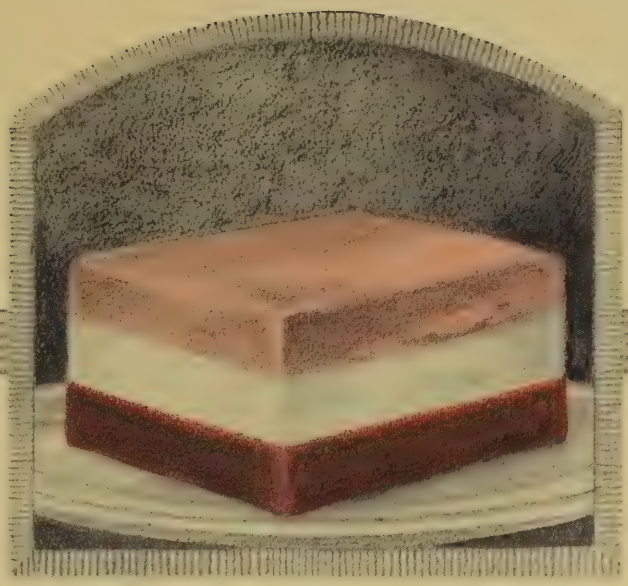
The most logical field for increasing the demands for ice cream is through children. They talk ice cream and think ice cream a great deal more than older people. It is a reality to them, something very important.

The schools are one of the best mediums for reaching children. Here we have the willingness to buy and the support of the teachers, who now accept dairy products in all forms as an ideal food for children.

Work to have children get the habit of eating ice cream, once, twice, or three times a day. This habit formed is certain to follow them and make them buy ice cream as they grow older.

I cut the following clipping from a newspaper:

"Tasting ice cream for the first time in their lives.—Joe Joble and his three sons from the mountains near Uniontown, Md., disposed of 61 dishes of it at their first sitting. Fifteen each for the boys and sixteen for the dad."



This remarkable consumption of ice cream would naturally lead one to believe that there would be great possibilities for some enterprising person to acquaint the children of our remote mountain districts with the taste of ice cream.

I was interested to learn that the well known Chapin-Sacks Corporation in casting about for a class to be appealed to, decided to direct its advertising at the children. The Chapin-Sacks Co. have taken the Mother Goose rhymes and incidents from Alice in Wonderland, twisted and changed them so ice cream becomes the dominant idea. This combined with illustrations showing these characters in a way that will make them recognizable to children, presents the subject to them in their own language and being backed up with pictures appeals to them in a responsive manner. Such a campaign of advertising stands a good chance of being a big success.

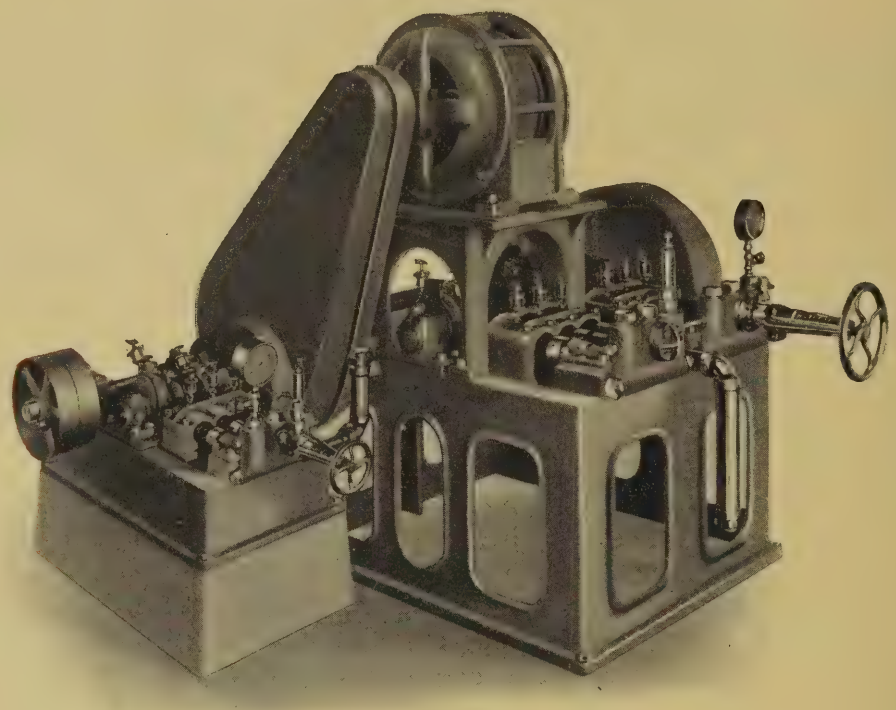
A satisfied retail distributor and the matter of co-operation, between manufacturer and retailer, is of utmost importance to both.

Every means should be used to bring about a better understanding between the two; of co-operation in advertising, selling price to the people and cleanliness in its distribution to the public.

Often ice cream in hands of the retailer becomes soft and unpalatable on account of carelessness and unsanitary conditions. Many retailers do not give any

Our Guarantee

IT does not consist merely of so many words or stereotyped phrases. It is backed up by our known performances, by a reputation of fairness, square dealing, quality and service established thru all these years of our business relations.



Our present customers' continued satisfaction and confidence in us and our products constitutes, we believe, an implied guarantee which you [who have not used B-F Flavor and Colors heretofore] will regard more highly and sincerely than any stilted guarantee we might try to compose.

The Boerner-Fry Company

Manufacturers of High Grade Extracts

Iowa City, Iowa

The Little Brother to the Big GAULIN Homogenizer

PERMIT us to introduce the new 60 gallon Gaulin Homogenizer—the latest and smallest member of the Gaulin family. The new member has the same family characteristics as its larger brothers.

It is built with the same precision and care as the larger capacity machines. It is made of the same superior selected material and has the same wonderful valve — the Gaulin Spring Homogenizing Valve. Thus, though of smaller capacity and selling at a comparatively low price, it turns out the same exquisite product as does its big brothers.

With the Gaulin Homogenizers the whole mix can be homogenized under pressure of 4000 lbs. per square inch. The Gaulin is the only machine which will operate under this pressure.

Gaulin Homogenizers are built in capacities of 60, 100, 250, 400 and 800 gallon capacities per hour. They may be obtained with belt or direct motor drive as desired.

Manufactured by The Manton Gaulin Mfg. Co., 11 Elkins St., Boston, Mass.

more care and attention to ice cream than they do to other articles of merchandise they are selling. They should be shown that ice cream needs attention, sanitary surroundings and neatness in distribution. This care means profit to the retailer and sometimes determines whether ice cream goes into the hands of the consumer in the same condition as it leaves our factory.

You cannot always do the right thing, no matter how zealously you try. The ice cream business requires eternal vigilance to insure things being 99 per cent right, more so than most other businesses, and any time anything goes wrong we should make an opportunity to let your trade know that you are eternally striving to be 100 per cent right.

They say competition is a valuable thing. As competition grows more vigorous our sale efforts in return must become more aggressive.

Ice cream sales can be increased by exercising more aggressive methods than have heretofore marked sales efforts. We must go out and develop the spirit of Get the Ice Cream Habit Daily and when developed, will sell more ice cream than would otherwise be possible.

There is a fable of a husky bull-frog named Wolly, who was somewhat inclined to be indolent. One day Wolly sat idly on a rock in the warm sunshine, eyeing with some disdain the efforts of other frogs to catch the bugs about them.

He conceived the idea that these other frogs were stupid creatures to waste so much effort seeking the foolish flies that flit about them. It was so unnecessary. If they would only sit still with their mouths open these flies would eventually fly in and meet their fate. So Wolly commenced at once to put his ideas into practice. Seated on a nice comfortable stone in the sunshine with his mouth open, he waited for the insects to fly in and furnish him with physical sustenance. The first day's results were somewhat disappointing and so were the next and the next. But Wolly was stubborn and believed in luck and each night thought that tomorrow would bring it luck. After three weeks he was too feeble to hop about and vainly cried for help. But his voice was weak and his neighbors too busy looking out for themselves. So Wooly croaked for the last time.

Moral: Don't wait for business to come to you. Go after it.

In closing, I have not created any new thoughts on this subject, but I trust by presenting it to you as I have, it may be an inspiration and incentive to be more aggressive. The American people are sold on quality and we should expertly cultivate the taste for ice cream.

If we are to progress and attain the ends which we desire for increased consumption, we must fight for them. Keep on fighting for a fighter will be rewarded in his business by its growth and betterment.

Remember, "Only the game fish swims up stream."

Mr. Dunne. Is there any one who desires to ask Mr. Stokes any questions on his address?

I want to call your attention to the fact that between eight and eighty-thirty the machines will be here and we go to the Seattle Yacht Club for our "Ice Cream Mix."

I want to call your attention to the fact that the Crescent Manufacturing Company, the makers of Mapleine, invite you to go through their plant where Mapleine is made.

There are several exhibits here and the salesmen would appreciate your looking at these various exhibits.

We should not close this meeting without paying tribute to those who have passed away during the past year. There has been no active member passed away during the last year, but we had with us last year a salesman named Atterbury. When I was down in San

It Helps You To Make Good

GELATINE is the most delicate ingredient in your whole mix.

Your success, the growth of your business, the profit you make—these depend upon the quality of the product you deliver. It must be of good quality and of standard quality. It must win the confidence of your trade; and hold this confidence. Gelatine is the most delicate ingredient in your whole mix. If it varies in taste, odor, strength, or it is not pure it is impossible to make a uniform ice cream. Essex Gelatine is absolutely constant. Its high quality does not vary. It is a pure, sweet product that you can depend upon. Essex Gelatine helps you to make good; helps you to build your business. Deliveries can be made from warehouses in Boston, New York, Philadelphia, Chicago, St. Louis and San Francisco. Write today regarding your requirements for 1922.

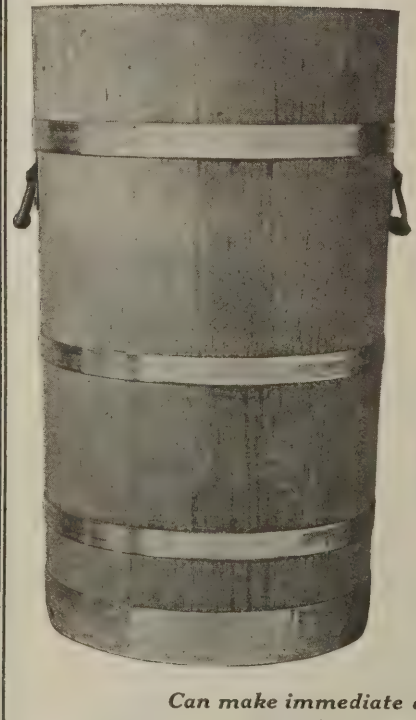
Francisco I wrote him a letter that I would be over to see him at the hospital, but he passed away the same day that I was intending to go to see him. He was in an automobile accident and passed away after a lingering illness. We will now please rise and stand in solemn meditation for a moment.

(All present then arose and stood in silent meditation).

The meeting will be adjourned until tomorrow morning at 10 o'clock, and remember, the least courtesy you can extend to those who have prepared papers, will be to be on time. There is a demonstration of a package machine to be made at 9 o'clock in the morning, the Rogers machine. Do not delay being here, because we will certainly give you hell if you are not here on time, if the ladies will excuse the expression.

Whereupon a recess was taken until the hour of 10 o'clock A. M. of the following day, Nov. 15, 1921.



MORNING SESSION.

Meeting called to order at 10:30 A. M., Nov. 15.

Mr. Dunne: The meeting will please come to order. I am sorry the men are not arriving better because there are some important papers to deliver this morning and I wanted them all to be here.

I want to know if there are any committees ready to report this morning?

The Hearst Service wishes to secure a photograph of the members attending this convention and this will be used in moving pictures and sent to all the Hearst papers wherever Hearst Service is maintained and they will be here today at 11:30, and I want to adjourn at that time for the purpose of permitting them to take a photograph just outside the hotel. It will be a little advertisement and every one of you might as well take advantage of it.

The Texas Barrel Company

is still manufacturing the best Ice Cream Tub on the market. Our increased sales assure us of that fact.

We were the pioneer makers of the TALL TUB and all other makes are imitations. While we are improving this TUB all the time, our imitators are content to stand still and hang on.

Specially prepared bottom so constructed as to withstand extremely rough treatment.

Can make immediate delivery. Write for prices.

Texas Barrel Company

HOUSTON *Box 665* TEXAS

The banquet tickets will be here later. We want you all to attend the banquet. And the tickets for tonight's stag will be handed out in due time.

I want to call attention to one other thing. The Mojonnier machine which was to be demonstrated here was wrecked by the railroad company and because of that fact they will be unable to demonstrate it to you. The Mojonnier people feel very badly about it, and so do we. We would like to see it.

We have a telegram here from Charles G. Morris and a telegram from George Burt, a member of the "Portland Chain Gang" which the secretary will read.

(The secretary then read said telegram).

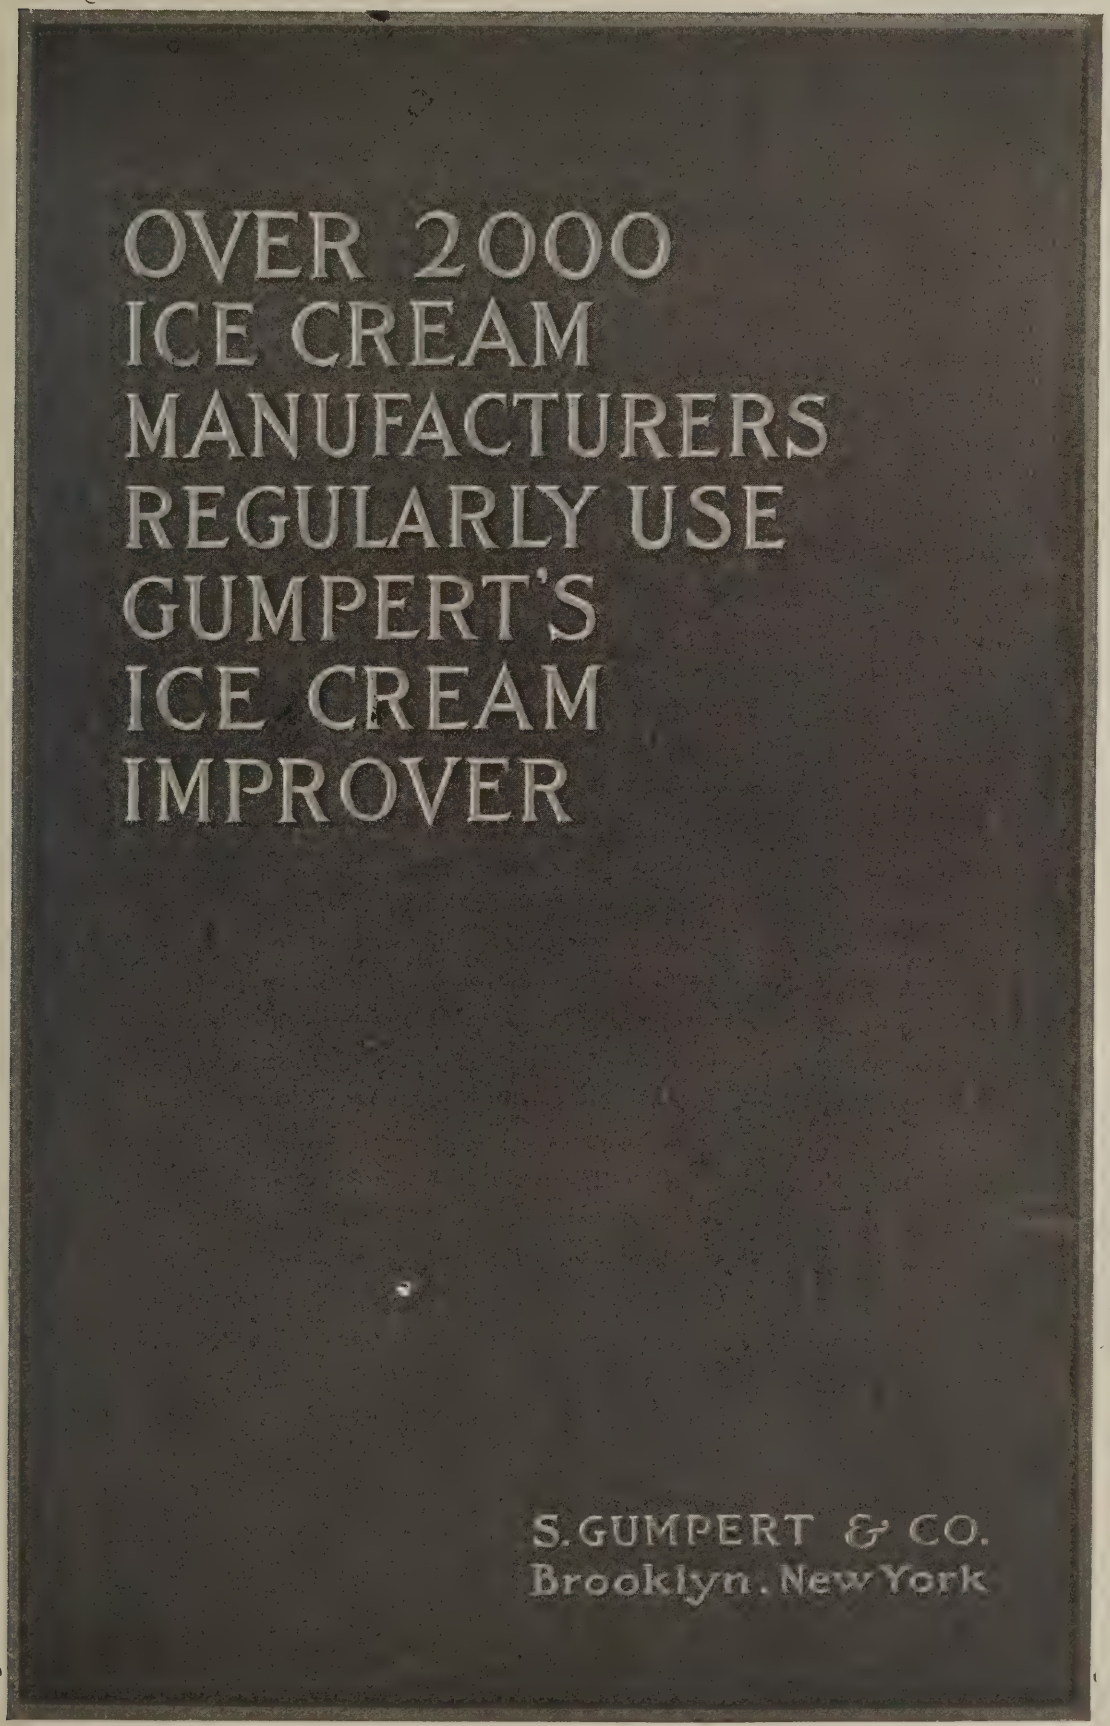
Mr. Dunne: Something broke loose down there and that is the reason the boys are staying on the job.

Whenever you boys get tired and you want to sing after the speaker has concluded, I want you to feel free to do so, or if you want to get up and stretch a little you can do that. Let it be understood this is an informal meeting and you can get up and stretch or do whatever you want to do when a speaker has concluded. The officers of this organization have to pay a fraternal visit to the Butter and Cheese Manufacturers' Association meeting on the floor above us, and if you will excuse us we will go and get back as soon as we can. I will call the Vice-President—but he is not here—I will call Mr. Swanberg to take the chair. Before I go I take pleasure in introducing to you Mr. W. R. W. Nichols, who will talk to you on "The Silent Salesman in Ice Cream."

Mr. Swanberg: (Taking up gavel) This is the first time I ever had a club in my hand.

Mr. Dunne: You usually have a horn. (Laughter).

Address by Mr. W. R. W. Nichols.



Mr. Nichols: Mr. Chairman, Ladies and Gentlemen of the Convention, I hardly thought when I wrote Bert Walker and said to him why not talk on "The Silent Salesman of Ice Cream" that that little line in that letter was going to bring me here today, but here I am just the same.

I have enjoyed the speeches and discussions that have been heard here. I listened with great interest to the "Silent Partner" and now I come with a paper on "The Silent Salesman," and we are both from Oakland (Laughter). But I enjoyed Mrs. Miller's talk very much. I have a silent partner and she sometimes tells me she is the general manager and I sometimes think she is. (Laughter). I am very close to advertising and I enjoyed Mr. Fernald's talk. I believe in advertising, I believe in publicity, and I believe in quality in the manufacture of ice cream, for without it all the advertising in the world is thrown away. We want people to get acquainted with ice cream not only as a dessert but as a food.

I called on a man in the east who was making ice cream in one end of the building and at the other end he had his horses and in the middle he had his ice. I do not see that in this country, as today you people have wonderful plants, well equipped, and have scientific methods for producing your ice cream.

Now we will get back to that "Silent Salesman in Ice Cream." In the manufacturing of ice cream we first realize that you must have pure milk, the best machinery and the best of ingredients to produce a satisfactory product.

The purity of ice cream starts from the milk and cream that you buy; the dry milk powder which you use; the sugar that turns it into a finished product, the cleanliness of the can or containers in which you distribute it to the consumer, even the ice that you pack around it; and last, but not least, the silent salesman flavor, which

WHEN SHIPPING ICE CREAM BY EXPRESS, NEVER USE A LARGER TUB THAN THE CAN REQUIRES.

creates the desire in the consumer for more of that real ice cream.

This silent salesman flavor has been abused for years, profit more fancy than real; has ever kept minds busy in trying to imitate or substitute flavor, when you order ham you want ham, you don't want vegetable ham; when you order coffee you want coffee, not a substitute for coffee. How many substitutes do we find for real flavor? Have you ever found an imitation that produced that luscious flavor which you secured from a well ripened peach? have you ever found a substitute for the twang we get in a lemon? Flavor is the basis of satisfying food, but is ever the aim of some chemist or some concern to imitate flavor. And let me say right now whenever the sale of imitation for true fruit flavor is made it is done either because there is a larger percentage of profit in the imitation product, or manufacturers are forced to do it to meet the demand for cheap flavor.

If you will refer to any formula that you have for making any class of ice cream, such as plain flavored ice cream what do you find? They are, for instance, always called by a flavor name— vanilla, chocolate, coffee, mint, maple. Suppose they are a fruit ice cream, they are called peach, strawberry, cherry, pineapple, raspberry. You don't call them by an imitation name—you call them by a true fruit flavor name. If it is nut creams, you call it walnut, almond, chestnut or pistachio.

Take cooked ice cream, such as French or Neopolitan, it is made from sugar, eggs and flavor. There is that silent salesman in ice cream.

Parfait or fruit creams are flavored with vanilla, chocolate and various fruits. Frozen puddings are flavored with fruit flavor; custard ice creams are practically always flavored with vanilla. Sherbets are flavored with fruit flavors or other natural flavor. Ices are fl vored with orange or lemon, or some other fruit flavor.

Punches are flavored with fruit flavors, spice flavo or wine flavors, and even when the country is dry can get wine flavor.

No matter what recipe you have for making i cream, you will always find that silent salesman—flav —the most prominent constituent for ice cream. Now flavor is the silent salesman in ice cream, if it is t salesman that brings repeat business, is it not to the a vantage of every ice cream manufacturer to study t quality of flavor? Take an item of cost, and say th every ten gallon batch has cost sixty cents to flavor wi the purest of flavor, would the overhead cost of six cen per gallon be too great to secure a real salesman?

The best paying salesman in our employ are tho to whom we are glad to pay the largest remuneratio It costs just as much to ship 150 pounds of live weig as it does to ship 150 pounds of dead weight.

The consumer purchases, asks for, and buys ice crea by a flavor name; then why not study flavor from scientific basis as you do milk solids and butterfat?

The silent salesman that is most prominent in i cream is vanilla, and there is nothing that has been imitated compounded, camouflaged, in fact, everythi that is within the conception of the human mind, as h this poor vanilla bean. You are told we are only usi Mexican vanilla beans, with a total production of Me can vanilla beans of about 500,000 pounds per year a about 150,000 of this 500,000 pounds cuts and splits, have often wondered where they get those Mexican v nilla beans from. Then take into consideration oth facts. Mexican vanilla beans are graded as follows:

Primes, goods, fairs, cuts, splits, and in fact th even increase this grading. Some concerns have t grading run up as many as seven different kinds of Me ican vanilla bean.

Then we have Bourbon beans, with a production something around 750,000 to a million pounds. We a have Guadeloupes beans, which run around twenty twenty-five thousand pounds per year. Then we ha South American, called Javas and Angostus, which r somewhere between forty thousand and fifty thousa pounds. We also have Tahiti, which runs from five hu dred and fifty to six hundred and fifty thousand poun per year.

You will note that we have enough of the differe kinds of vanilla beans. Take the Mexican vanilla bea for illustration and what do we find? A Mexican vani bean has a wonderful boquet and aroma, but lacks strength of flavor.

If you take this vanilla bean and cut it open, y find myriads of little black seeds and among these see you find crystal like particles which is the natural va lin, or, as they call it, the active flavoring principle vanilla beans. With due regard to the fact that che ists call natural vanillin the active flavoring princi of vanilla beans they all admit that these small bla seeds or resinous matter add to the flavoring prope of true vanilla.

As before stated, Mexican beans have bouquet a aroma but they lack in strength of flavor. In oth words, this resinous part and vanillin do not predomin as they do in other beans.

Bourbon vanilla bean as you all know, come from French possessions. They are strong in natural vanil but lack in resinous matter. In other words these sm black particles do not predominate in a Bourbon be so as to back up the excessive amount of vanillin fou in this bean.

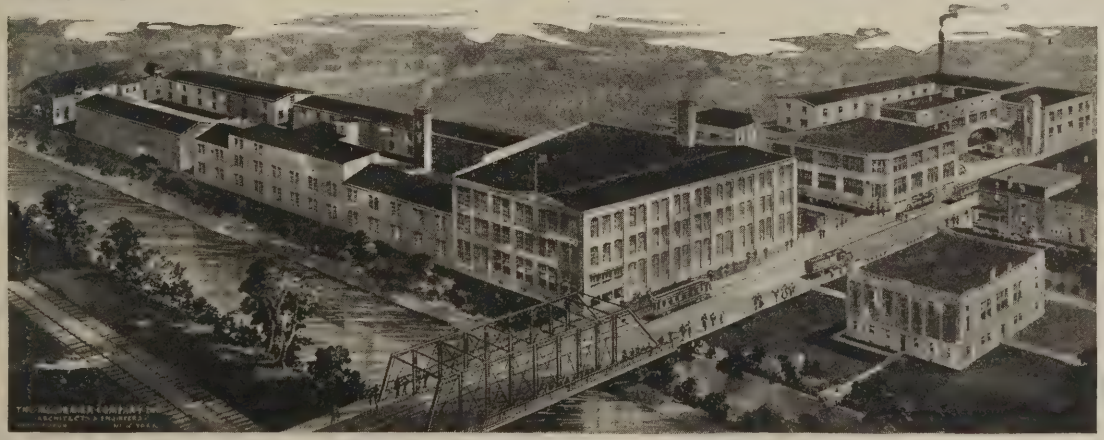
What Will It Cost

TO BUILD or REMODEL ?

Freezing Room, Imperial Ice Cream Co., Wheeling, W. Va.

To start construction of a new plant or a remodeling job without a definite knowledge of its total cost, as well as its final efficiency and capacity, is a "cat-in-a-poke" practice which often causes disappointments, financial embarrassment and plant congestion.



McCormick Architectural and Engineering Service

is guided by long experience in the planning and construction of ice cream and dairy plants throughout the country, from which has been compiled exhaustive and invaluable cost data of materials as well as dependable knowledge of final capacities and operative ideas. That is why our plans and estimates are so accurate, and why the cost of the Service is so quickly made up by the numerous economies effected.

Regardless of the size or nature of your contemplated new plant or remodeling job, it will not obligate you to get McCORMICK SERVICE estimates. Just write us that you are interested.

THE McCORMICK COMPANY, Inc.

York Sanitary Milk Company, York, Pa.

Construction Executed by Your Own Local Contractors Under the Direction of Our Special Superintendents

FANCY FORMS MAKE "SPECIAL DAY" ICE CREAM SERVING POPULAR.

Then next in order we come to the vanilla bean known as Guadaloupes. These guadaloupes were transplanted on the island of Guadaloupe from Mexico, and have an excessive amount of small black seeds or resinous matter but do not predominate in natural vanillin.

If we will take these three vanilla beans and blend them together, we first have aroma and bouquet; second, strength of natural vanillin; and third, an excessive amount of total solids or a real foundation from which to build flavor.

We all know that nature produces both the strong and the weak, not only in human character but as well in plant life, and it is the blending of these together that produces uniformity and strength. We all know that it is true that every food manufactured on the American market is blending the strong, the mild and the weak, and it is this blending which produces satisfying flavor.

Another vanilla bean which we have not taken into consideration, and which is produced in large quantities, is the Tahiti bean. The Tahiti vanilla bean contains an excessive amount of resinous matter, or what might be called mucilage matter, and although kept in solution in the solvent or carrier alcohol, will invariably come out of solution, and if any time you purchase a Tahiti bean vanilla in kegs or barrels you will find an excessive amount of the resinous matter deposited at the bottom of the keg or barrel, as it seems almost impossible to keep these resin from Tahiti beans in solution. The Tahiti bean does not lend itself to the blending with others, as it has a predominant flavor which is closely associated with heliothrope and you can almost immediately detect it from this peculiar aroma, and consequently this particular vanilla is not much desired in the manufacturing of food products.

The next point we come to is the adulteration of pure vanilla; that is, the imitation and compounding of a pure vanilla flavor. The most prominent adulterant is vanillin, which is used to reinforce cheap vanillas or vanillas that are low in total amount of vanilla beans used to each gallon of extract, and is called reinforcing.

The next adulterant of pure vanilla is Tonka beans. Although some people would associate the tonka bean with true vanilla bean there is no association, whatever. One is a long bean like this one I have here, and the other is a small round bean similar to a cocoa bean. If we go back to the time of our grandfathers, we find that tonka beans were called snuff beans, and were used by them to flavor their snuff boxes, and it has been impossible to take tonka beans away from the tobacco industry, for today the majority of tonka extract manufactured is used by tobacco manufacturers, and will you tell me what conncetion this has with ice cream? I am sure that a flavor that sells tobacco is not a success salesman in ice cream.

The active flavoring principle of tonka beans is c marin and it is this chemical coumarin which we f used as an adulterant for pure vanilla, same as the ch ical vanillin which we spoke of.

Tonka beans, chemical vanillin or coumarin alw remind me of adding chickery to coffee. Have you co or have you chickery coffee? You have a rank ha flavor. When any imitation is added to a pure vani or another article is compounded with it, it invaria reduces the quality of that product also the cost at wh it can be made. Imitation vanilla or compound van pays a larger percentage of profit to the manufactu than does pure vanilla, and it is a simple process to m a price to meet requirements. You can reduce first grade of beans used in the manufacturing of a pure nilla, next cut down your alcohol content to the low minimum possible to hold your vanilla beans in soluti next add chemical vanillin, coumarin or tonka bean. other words, subtract quality and add chemicals water.

Now you will invariably find if you have a real g friend and ask him the truth about the flavor busin he will tell you the truth that the manufacturer w sells you imitation or compound flavors instead of pu is making a larger percentage of profit on the imitat or compounds than he is on the pure goods. In ot words, if you want a real silent double-fisted, go-gett salesman, put pure vanilla in your ice cream.

Finance Committee Reports Tariff Bill

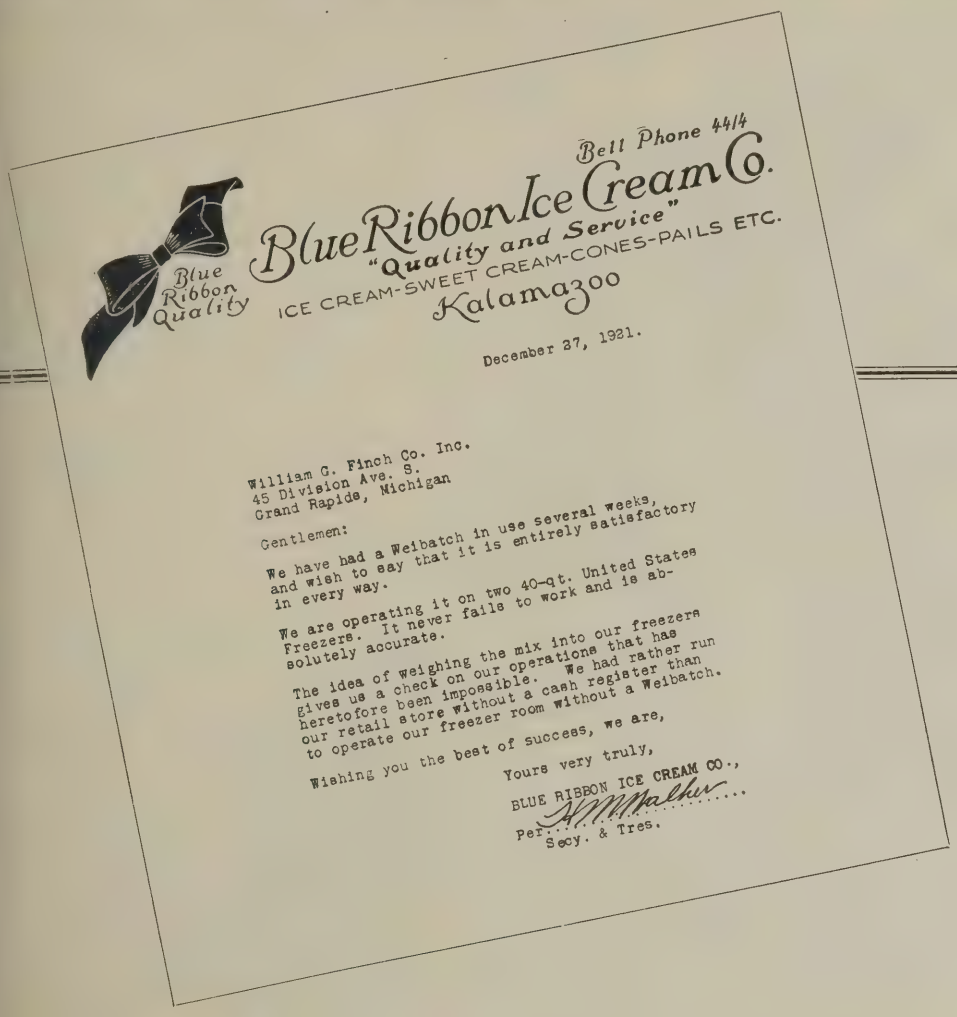
VERY satisfactory protection has been given to dairy products in the revised tariff bill just reported out to the Senate by Senator McCumber, of North Dakota, the new chairman of the Senate Finance Committee. Never before have agricultural duties been fixed at such a high level, and never before has the farmer's argument been more respectfully listened to.

President Milo D. Campbell, of the National Milk Producers, expresses his approval as follows: "Dairymen have cause to be pretty well satisfied with the bill reported to the Senate. It gives them adequate protection against Canada and the dairying countries of Europe, like Denmark and Holland. It gives us a chance to control our home markets to a certain extent, and the home market means much more to us than foreign trade. Ninety per cent of all our products are sold at home, and with a revival of trade so that the country can buy more city products and the city more country products there will be prosperity for all. The principal thing is to protect our own markets and then to upbuild them. Nearly half our population lives on farms, and their best interests must be served before you can have national prosperity."

Senator Gooding, of Idaho, one of the Senate champions of agriculture, was enthusiastic over the bill, saying: "It is the first all-American tariff bill, because, for the first time, the farmer is getting his full measure of protection, the same as the manufacturer. The farmer is getting 99% of all the duties he asked for. Considered from every angle, and with a few provisions only excepted, it is a very fine measure."

Representative Dickinson, of Iowa, a staunch "farm bloc" leader, was equally pleased with the bill, in spite of many corrections which the Senate committee has made upon the House draft. He said: "For the first time in history the farmer is getting his just dues. This is because he has organized, and worked hard and made a good showing here at Washington. The farmer figured out what he wanted, then he fought for it. The only provisions which are harmful are those affecting vegetable oils. The Southern farmers who produce cottonseed and peanuts are the ones chiefly hurt by this, and it is largely their fault. They did not work for a duty on vegetable oils as they should have and their Congressmen, being free traders in most cases, have actually voted against protecting their constituents."

The only "fly in the ointment" then is vegetable oil duties. Paragraph 50a of Schedule 7 permits the importers of foreign vegetable oils to "drawback" the duties they pay, in case the oils are used in making non-edible products, such as soaps, paints and varnishes. All farm organizations agree that this is as dangerous a practice as it is a new and untried practice when applied to goods for domestic use.



The National Milk Producers' Federation is particularly incensed also at the placing of copra (cocoanut rind) on the free list, for 2,000 pounds of copra will make 1,100 pounds of cocoanut oil, an adultrant which is used in increasing quantities for the manufacture of "oiled" milk, an imitation.

The following table will show exactly what the situation is, what has been granted and what has been denied:

What Dairy Organizations Want.

Par. 707. (to read) Whole milk, sweet or sour, 3½ cents per gallon; cream, sweet or sour, having not more

Gentlemen:

We have had a Weibatch in use several weeks, and wish to say that it is entirely satisfactory in every way.

We are operating it on two 40-qt. United States Freezers. It never fails to work and is absolutely accurate.

The idea of weighing the mix into our freezers gives us a check on our operations that has heretofore been impossible. We had rather run our retail store without a cash register than to operate our freezer room without a Weibatch.

Wishing you the best of success, we are,

Yours very truly,

BLUE RIBBON ICE CREAM CO.,

Per H. M. Walker

Secy. & Treas.

The WEIBATCH

It Weighs

AS AN ice cream batch control, one Weibatch, placed between two freezers, will automatically weigh, record, and deliver to the freezers a definite number of pounds of ice cream mix. It will save time, prevent waste, and give the factory manager a check on the mixing room, freezing room, and hardening room that has heretofore been impossible.

Every ice cream manufacturer knows that the specific gravity of ice cream mix is constantly changing, and that any measuring device, no matter how accurate it may be in volume, is very misleading when checking back against the mixing room or the freezer room.

Eliminate Guesswork—Weigh the Mix

Manufactured by

VEGETABLE OILS SCHEDULE.

Product	Duties allowed in Senate Bill	Duties sought by Farm Organizations
Cottonseed oil	3c per lb.*	4c per lb.
Cocoanut oil	4c " "	4c " "
Soya bean oil	3c " "	4c " "
Peanut oil	4c " "	4½c " "
Copra (dried cocoanut cake)	Free List	2c " "
Soya beans	4/10 of 1c per lb.	¾c " "
Cottonseed	⅓ " " "	¾c " "

*Provided, That such oils may be imported under bond in an amount to be fixed by the Secretary of the Treasury and under such regulations as he shall prescribe; and if within three years from the date of importation or withdrawal from bonded warehouse, satisfactory proof is furnished that the oil has been used in the manufacture of articles unfit for food, the duties shall be remitted.

This vegetable oil situation has developed because of the strenuous and ceaseless activities of the "soap lobby" which is working, not only for the big soap makers, who also make lard compounds and oleos, but for the big makers of paints and varnishes as well.

For over a year this group has maintained headquarters at Washington and has propagated a veritable flood of letters from laundries and retail grocers and other commercial consumers of soaps and oleos in all parts of the country. Senator Calder of New York, member of the Senate Finance Committee, declared he was informed that over 25,000 letters urging the free importation of vegetable oils had been received at the office and held unanswered.

When a 2 cent per pound duty was imposed by the Fordney Committee in the House, the Soap Lobby was very much incensed. They didn't like it a bit. They won over the butter dealers. They won over a large number of cottonseed crushers in the South, which gave then a strong leverage.

Long hearings were held at which they pleaded their case and the crying need of the American laundryman and groceryman for a cheap soap. They had little to say of the cotton grower, the corn grower, the hog raiser and the American producers of peanut oil and flaxseed, etc.

As a result the Senate Finance Committee decided to compromise the situation and please everybody. They tried to protect and please the dairy interests by putting a duty on any foreign oils imported for edible purposes, such as oleos, lard compounds, salad dressings, etc. The soap lobby agreed heartily to that, and so they put on the highest duty that had been asked. Then they pleased the soap people by arranging a "drawback" of all duties paid on oils that were used for non-edible purposes, such as paints, soaps, varnishes, leathers, etc.

Thus it happens that vegetable oil imports which totaled in 1920 over 1,379,126 tons may yet be brought into thsi country free of duty, by simply diverting them all to non-edible products. Such a rapidly increasing business as this has proved to be, would soon be able to cut the markets away from the American producer, who has to pay American labor prices instead of the 5 or 10 cents per day that is customary in the Orient. It would disorganize our home-grown fats and oils industry more than can now be calculated.

Senator Gooding of Idaho has introduced four different amendments affecting this situation which should be supported by all concerned. He is asking:

a. 3 cents on peanuts unshelled; 4 cents on shelled.
b. 2 cents a pound on rice.
c. 1½ cents a pound on soya beans.
d. Full duty on vegetable oils, as requested by the farm organizations, and for 2 cents a pound on copra.

There is no import problem more serious to agriculture than that of these Oriental oils which closely resemble our own home-grown products and which can be used interchangeably for edible and inedible purposes. This final fight must be won in order to properly stabilize the whole fabric of American agriculture.

Don't be without a position, when at a small cost you can locate one through the Want Department in The Ice Cream Review.

FREEZE YOUR ICE CREAM IN AN ADVERTISED FREEZER.

PROF. BAER'S INQUIRY DEPARTMENT

Dear Sir:—I am sending you a formula which I would like to have explained in the next Ice Cream Review number.

I am just lately running the sugar through the homogenizer, have heretofore never done it. I think it is an improvement doing so. F. S.

Reply: You will find the analysis of both of the mixes you sent below in Table No. 1 and Table No. 2.

Table No. 1.

Ingredients	Fat	Serum Solids	Total Solids
595.0 lbs. 20% cream	119.0	38.08	157.08
258.0 lbs. 3% milk	7.74	22.30	30.04
180.0 lbs. condensed	10.80	32.40	43.20
168.0 lbs. sugar	....	....	159.60
1201.0 lbs.	137.54	92.78	387.32
Per cent	11.45	7.73	32.28

Table 2.

Ingredients	Fat	Serum Solids	Total Solids
680.0 lbs. 20% cream	136.0	48.42	184.42
258.0 lbs. 3% milk	7.74	22.30	30.04
270.0 lbs. condensed	16.20	48.60	64.80
196.0 lbs. sugar	....	....	186.20
1404.0 lbs.	159.94	119.32	465.46
Per cent	11.39	8.5	33.24

Your mix as shown by Table No. 2 is a little better balanced for butterfat, serum solids, and total solids than the mix in Table No. 1. Good commercial ice cream should have 20 per cent milk solids. Your mix No. 2 shows 19.89 per cent. Your mix No. 1 is also a little low in total solids compared with No. 2.

You should have no difficulty in making a satisfactory ice cream from your mix as shown by Table No. 2. You also stated that you believed your mix was improved by running the entire mix, including the sugar, through the homogenizer. I have been recommending this process for many years as you cannot get through pasteurization of your mix if you leave the sugar out and you will also get much better results from your sugar if you heat it with the rest of the mix and homogenize it all together. I am glad to know of your good results in this respect.

Dear Sir:—We are endeavoring to check by actual measurement our calculation of the gallonage in the mix and we are having considerable trouble making these two figures agree.

Can you advise just what difference in liquid gallons, the introduction of sugar, powdered milk and cocoa into this raw mix would make? G. M. B.

Reply: If I analyzed your problem correctly 100 lbs. of your ice cream mix would contain 74 lbs. of milk and cream and 26 lbs. of sugar, cocoa syrup and powdered milk. The 74 lbs. of milk and cream weighing 8.4 lbs. to a gallon would equal 8.8 gallons. Your ice cream mix would weigh 9 lbs. to a gallon. Dividing 100 lbs. by 9 lbs. would yield 11.1 gallons of ice cream mix or you would have an increase of 2.3 gallons over the milk and cream.

This will probably help you solve the question.

* * *

Dear Sir:—I would like very much for you to make up a formula of the ingredients I am sending you with a 12 per cent butterfat, and solids which you think best. How much finished ice cream should 100 lbs. of the mix make? I intend to pasteurize and run it through an emulsifier and let ripen 24 hours. E. F. H.

Reply: I am suggesting below in Table No. 1 how you could proportion the various ingredients which you desire to use into a well balanced ice cream mix.

Table No. 1.

100 lb. mix—12 per cent fat, 9 per cent serum solids and 35 per cent total solids.

Ingredients	Fat	Serum Solids	Total Solids
14.0 lbs. sugar	....	....	13.50
.6 lbs. gelatine	....	....	.57
3.0 lbs. skimmilk powder	....	2.85	2.85
43.0 lbs. 25% cream	10.70	2.87	13.57
39.4 lbs. 3.5% milk	1.30	3.39	4.69
100.0 lbs.	12.00	9.11	34.98

I believe if you will follow the suggestions given you will have no trouble in securing a satisfactory ice cream.

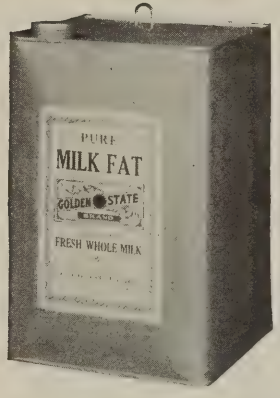
* * *

Dear Sir:—The mix I wanted you to figure is as follows: 4 per cent whole milk, 20 per cent cream and sweetened condensed skimmilk, with skimmilk powder. A 100 lb. mix is what I suggested. You also stated in your letter you would show me how calculations are made figuring the various percentage from the various ingredients. F. E. S.

Reply: I am assuming that you want a 10 per cent mix and I am suggesting below in Table No. 1 how such a mix could be prepared from the ingredients given in your letter.

Table No. 1.

100 lb. mix—10 per cent fat.



Ingredients	Fat	Serum Solids	Total Solids
10.0 lbs. sugar	....	....	9.50
.5 lbs. gelatine	....	....	.47
10.0 lbs. sweet condensed	....	2.70	6.70
2.0 lbs. skimmilk powder	....	1.90	1.90
43.5 lbs. 20% cream	8.70	3.09	11.79
34.0 lbs. 4% milk	1.37	2.90	4.27
100.0 lbs.	10.07	10.59	34.63

In making your calculations, beginning with the 10 lbs. of sweet condensed milk which contains 27 per cent serum solids and 40 per cent sugar, you arrive at the figure 2.7 and 6.7 for the serum solids and the total solids. The skimmilk powder is figured at the rate of 95 per cent solids and 2 lbs. would yield 1.9 lbs. The

GOLDEN STATE Powdered Skim Milk & high score sweet butter—or better still, GOLDEN STATE Pure Milk Fat is the combination for an ideal Ice Cream mix.

CALIFORNIA CENTRAL CREAMERIES INC.

175 FRANKLIN STREET - NEW YORK CITY

SAN FRANCISCO CHICAGO LOS ANGELES

THE RIGHT KIND OF COLD STORAGE DOORS FIGURE PROMINENTLY IN THE PLANT.

43.5 lbs. of 20 per cent cream would yield 8.7 lbs. of butterfat. To arrive at the serum solids I subtracted 8.7 from 43.5 and multiplied the result by 8.9 per cent. In similar manner you would calculate the serum solids from the 4 per cent milk.

* * *

Dear Sir:—I will be pleased to have you tell me which of the following ways is the better plan for making a high-grade ice cream: First—By using pure cream, evaporated condensed milk, or milk powder, uncooked or heated in any way. Second—Or from a homogenized cream made from sweet butter and skimmilk powder.

Please give me a recipe for making a 12 per cent butterfat ice cream by using pure cream, evaporated condensed milk, milk powder, or both, same to be uncooked.

Kindly tell me what you would consider the thing to use for a substitute as a "Rum" flavor in making frozen egg-nog or frozen punch. F. F. V.

Reply: I am glad to state for your information that the first method mentioned in your letter using pure cream, evaporated condensed milk, or milk powder will in most cases make a more satisfactory ice cream than one made from sweet butter and skimmilk powder by the use of the homogenizer.

It is possible to make as good an ice cream by the latter method providing one can make it from a fresh, well flavored butter and a good fresh powder. It has been my experience, however, that it is not always possible to obtain first grade materials in this way.

I am suggesting below in Table No. 1 and Table No. 2, 100 lb. mixes made up according to the suggestions in your letters.

Table No. 1.

100 lb. mix—12 per cent fat, 10 per cent serum solids.

Ingredients	Fat	Serum Solids	Total Solids
14.0 lbs. sugar	....	....	13.30
.5 lbs. gelatine	....	....	.47
20.0 lbs. Evap. milk 8%	1.60	3.60	5.20
2.0 lbs. skimmilk powder	....	1.90	1.90
63.5 lbs. cream & milk	10.40	4.72	15.12
100.0 lbs.	12.00	10.22	35.99

Table No. 2.

100 lb. mix—12 per cent fat, 9 per cent serum solids.

Ingredients	Fat	Serum Solids	Total Solids
14.0 lbs. sugar	....	....	13.30
.5 lbs. gelatine	....	....	.47
19.0 lbs. evap. milk	.72	1.62	2.34
2.0 lbs. skimmilk powder	....	1.90	1.90
74.5 cream & milk	11.28	5.62	16.90
100.0 lbs.	12.00	9.14	34.91

Relative to a substitute for a "Rum" flavor I am sorry that I cannot suggest anything to you but you can undoubtedly secure such a substitute from some of the dealers in extracts and flavors.

* * *

Dear Sir:—My mix consists of the following, would you please analyze: 10 quarts 40 per cent butterfat cream, 10 quarts 3.5 per cent fresh milk, 8 lbs. sugar, 3 ounces gelatine, 8 ounces flavor.

What is the per cent butterfat? What is the per cent serum solids? What is the per cent total solids?

C. E. G.

Reply: Relative to the per cent of butterfat, serum solids, and total solids in your mix, I am glad to give you below in Table No. 1 the analysis of your mix and the per cent of the various ingredients.

Table No. 1.

Ingredients 10 quarts or	Fat	Serum Solids	Total Solids
20.0 lbs. 40% cream	8.0	1.07	9.07
21.5 lbs. 3.5% milk	.752	1.85	2.60
8.0 lbs. sugar	....	....	7.60
.02 lbs. gelatine	....	....	.19
.5 lbs. flavor	....	....	.07
50.2 lbs.	8.752	2.92	19.53
Per cent	17.50	5.84	39.06

* * *

Dear Sir:—You have given previously formulas for a 10 and 12 per cent ice cream. In both of these, evaporated milk, butter and skimmilk powder are used. Will you please tell me the practical advantages of using these different sources of fat and solids instead of straight butter or cream and skimmilk powder.

W. D. D.

Reply: You referred to a formula for a 10 and 12 per cent ice cream. I am glad to say by way of information that the evaporated milk contained in these two formulas to which you undoubtedly refer was put there at the suggestion of the inquirer who wanted the formulas calculated.

There is, in my opinion, no advantage in using the evaporated milk unless you desire the particular flavor which this product imparts to the ice cream.

* * *

Dear Sir:—One question relative to fat and solids contents. Is it possible to have a uniform test for fat in every can run from a 1,000 lbs. mix? In this the agitator was working during the time of freezing and the mix tested 10 per cent for fat.

I have at different times had samples taken from my plant by inspectors and have noted if the sample is taken from the top before any cream is removed the

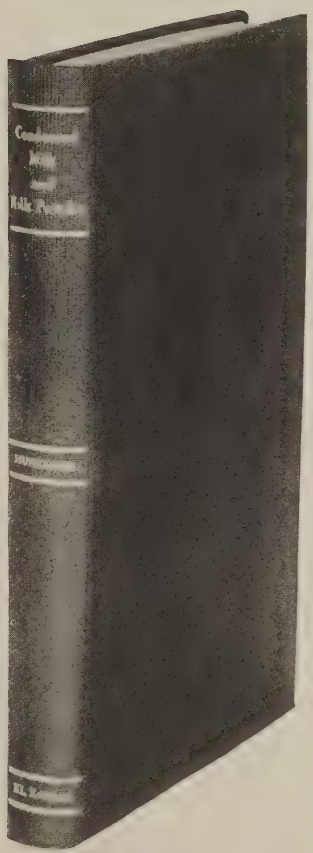
Are You Prepared for an Opportunity Like This

WANTED—Experienced plant superintendent for large ice cream manufacturing plant on the coast. Must have practical experience and knowledge in the latest methods of ice cream mix and freezing. **Must know condensed milk thoroughly** as applied to manufacturing of ice cream. Must have the best references. This is a big job. Only capable men need apply. Address: R-265, Ice Cream Review. 4-22



This Ad appeared in the April issue of The Ice Cream Review. It goes to show that the "Big" opportunities are open to those with a thorough knowledge of subjects relating to ice cream making other than just being able to draw a satisfactory product from the freezer.

You can get a thorough knowledge of all the ins and outs of condensed, evaporated and powderedmilk from

Prof. Hunziker's Book

CONDENSED MILK AND MILK POWDER

Have a copy handy for ready reference. Much of the information therein can be applied in the conduct of present day ice cream manufacture. It gives you a better understanding of qualities and values of the goods purchased to make up an economical and trade getting mix.

THE EAGLE IS AN INSPIRING BIRD, BUT THE NATION'S FUTURE DEPENDS UPON THE COW.

report has always been more than 10 per cent fat. In 1920 a sample was given an inspector from the bottom of a five gallon can and the report came back 7.5 per cent fat. However the total solids as in this case was about correct. I am at a loss to account for this difference when a homogenizer is used. O. S. P.

Reply: Relative to your inquiry regarding the butterfat and solids content of the homogenized mix secured by taking samples at different times in the process of mixing, I am sure that if the product were perfectly homogenized it would not make any difference in the way the sample is taken.

There is, however, no question but what in an ice cream factory one may expect variations in the composition of the mix unless the entire mix is thoroughly agitated. If the homogenizer is not working properly you might expect considerable difference when taking samples before and after agitation.

* * *

Dear Sir:—Is it possible for me to obtain rules for calculating solids contained in different ingredients used in the manufacture of ice cream such as serum, milk, sucrose, other solids not fat, water, etc.

Thanking you in advance for any information rendered. W. F. S.

Reply: To calculate the solids of the milk serum or the skimmilk you multiply the number of pounds of skimmilk or serum used by the factor 8.9. This will give you the number of pounds of serum solids. To calculate the amount of the solids in whole milk, not fat, subtract the number of pounds of fat furnished by the milk from the total weight of the milk which will give you the milk serum or skimmilk. Then you again multiply this by 8.9 per cent.

Sugar or sucrose on the average contains 95 per cent solids. Gelatine 95 per cent; skimmilk powder 95 per cent; evaporated milk 8 per cent of butterfat and 18 per cent serum solids or a total of 26 per cent solids. Sweetened condensed skimmilk usually contains 40 per cent sugar and 27 per cent serum solids.

* * *

Reply to R. B.: I have your letter of recent date with request for our method of testing ice cream for butterfat by the Babcock test. I am glad to advise that we are getting excellent results. Our method is known as the Glacial Acetic Sulfuric Acid Test and in making this test weigh nine grams of ice cream mix into a nine gram, 50 per cent bottle, then add the acid mixture, consisting of the two acids mixed in equal parts.

We usually find that it takes from eighteen to twenty cubic centimeters of this acid mixture to produce the right results. The acids may be added separately. Add the glacial acid first and the sulfuric afterward. We found, however, that we could get better results by mixing the two acids just immediately before adding them to the contents of the test bottle.

I may state further that this method of testing ice cream was first suggested by the Oklahoma Agricultural Dairy Department about five years ago and is now used quite extensively through the country.

* * *

Dear Sir:—We submit herewith formula for ice cream mix which is causing us trouble with sandiness: 80 gallons of 20 per cent cream, 50 gallons of 3 per cent milk, and 20 gallons of unsweetened skim condensed, 180 pounds of sugar, and 7 pounds of gelatine.

The above is the contents of mix, which we are at present using, and causing us much trouble with sandy ice cream.

This mix is pasteurized to 150 degrees, and held for 30 minutes. We are using Manton Gaulin homogenizer. We obtained 85 per cent overrun.

Would appreciate very much if you could show us wherein the fault lies. Is it in the mix itself, or the temperature at which the finished ice cream is held after freezing, which caused the sandiness?

A. I. C. CO.

Reply: I have analyzed your ice cream formula and you will find an analysis given below in Table No. 1.

Table No. 1.

Ingredients	Fat	Serum Solids	Total Solids
80 gals. or 672 lbs. 20% cream	134.40	47.84	182.29
50 gals. or 430 lbs. 3% milk	12.90	37.12	50.02
20 gals. or 180 lbs. skim condensed	.....	57.60	57.60
180 lbs sugar	.....	.....	171.00
7.0 lbs. gelatine	.....	.....	6.65
1,469 lbs.	147.30	142.56	467.56
Per cent	10.02	9.8	31.1

Your table does not contain a large amount of milk serum solids and there is just two possible reasons why you should get "sandy" ice cream. First, the unsweetened skim condensed is probably the cause of your trouble. This milk may have been held in storage for sometime at a very low temperature which causes the crystalization of the milk sugar and thus produces this sandy condition. Another possible reason for the sandy ice cream is a too low a temperature of the hardening room. You are usually bound to get sandy ice cream if your product is held at a temperature above from 10 to 20 degrees below zero.

I shall be very glad to hear from you again if you find that that is not the reason for your trouble and try to help you locate it.

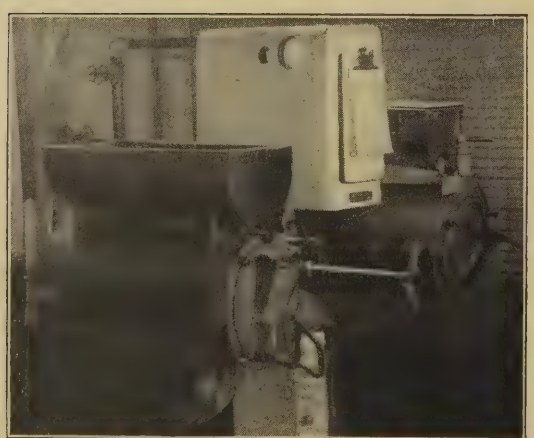
Standardize Your Ice Cream

Standardize the Flavor in the Mojonnier Vacuum Condensing Unit

Mojonnier Vacuum Condensing Unit (5') in plant of Lawrence Ice Cream Co., Chicago. Temperature of milk never exceeds 140° either in hot wells or vacuum pan.



ICE CREAM manufacturers everywhere are fast recognizing the invaluable advantages of the Mojonnier Vacuum Condensing Unit. By displacing the pasteurizer and mixing tank it enables the manufacturer to make his mix from fresh milk direct from the producer and cut the cost of his mix 10c per gallon.

The Mojonnier Vacuum Condensing Unit is a scientifically designed combination of Vacuum Pan, Hot Well, Vacuum Pump, Steam Piping and Traps, steps and all other accessories necessary for a complete Condensing Unit.
Converts waste into profits by converting surplus milk into sweetened condensed milk or other condensed milk products for which there is a ready market.

Compactly built, it takes up little room. Simple and easy to operate.

Write for 12-page profusely illustrated circular just off the press.

Standardize the "Swell" with the Mojonnier Overrun Tester

Overrun Test in plant of Decatur Ice Cream Co., Decatur, Ala. Mr. Clopton writes it is "one of the most important machines in our plant."

WITHOUT definite means of control, the "swell" or overrun in ice cream is subject to wide variation from day to day and from batch to batch.

The Mojonnier Overrun Tester enables you to control your overrun absolutely. You don't have to guess. You can test it while the cream is still in the freezer and control the factors that affect the overrun.

Each per cent of overrun represents just .4c per gallon of mix. Increase your average overrun only 10% and it means a saving of 4c a gallon, or $4,000.00 a year on 100,000 gallons. It is savings such as these that are attracting ice cream manufacturers to the Mojonnier Overrun Tester. Used by the largest ice cream plants in the country: Hortons, Telling-Belle Vernon Co., Hydrox, Abbotts, etc. Also by progressive ice cream manufacturers operating two or more freezers. *Write for Circular*

EFFICIENCY PRODUCTS Mojonnier

Mojonnier Bros. Co.

MILK ENGINEERS

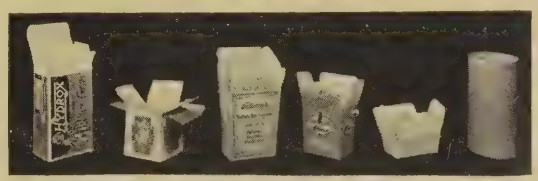
by the MOJONNIER Process



Standardize the Package with the Mojonnier Packaging Machine

THE Mojonnier Ice Cream Packaging Machine is a LABOR SAVER. In one plant it reduced the labor of packaging from twelve to seven operations; reduced number of helpers from seven to three; has reduced hardenings from three to one. Eliminates pouring into molds, dipping, cutting, wrapping and exposure to heat and air after hardening, improving quality and texture of the brick ice cream. It prevents loss of ice cream and does not reduce overrun.

The Mojonnier Packaging Machine is positive in action and of the measured feed type. Fills all shapes illustrated herewith—quarts to individuals — accurately. No overweight; no air-pockets; nothing taken for granted. Fills either one, two or three flavors at the rate of twelve hundred bricks per hour. Finished brick wrapped in parchment can be unwrapped just the same as brick wrapped by hand. Used for making quart slabs for Eskimo Pie—no dipping necessary. Write for circular.

Mojonnier Ice Cream Packaging machine in opertion at the big plant of the Hydrox Co., Chicago, where they package their entire output of one, two and three flavor bricks.

Fills any of the types illustrated above.

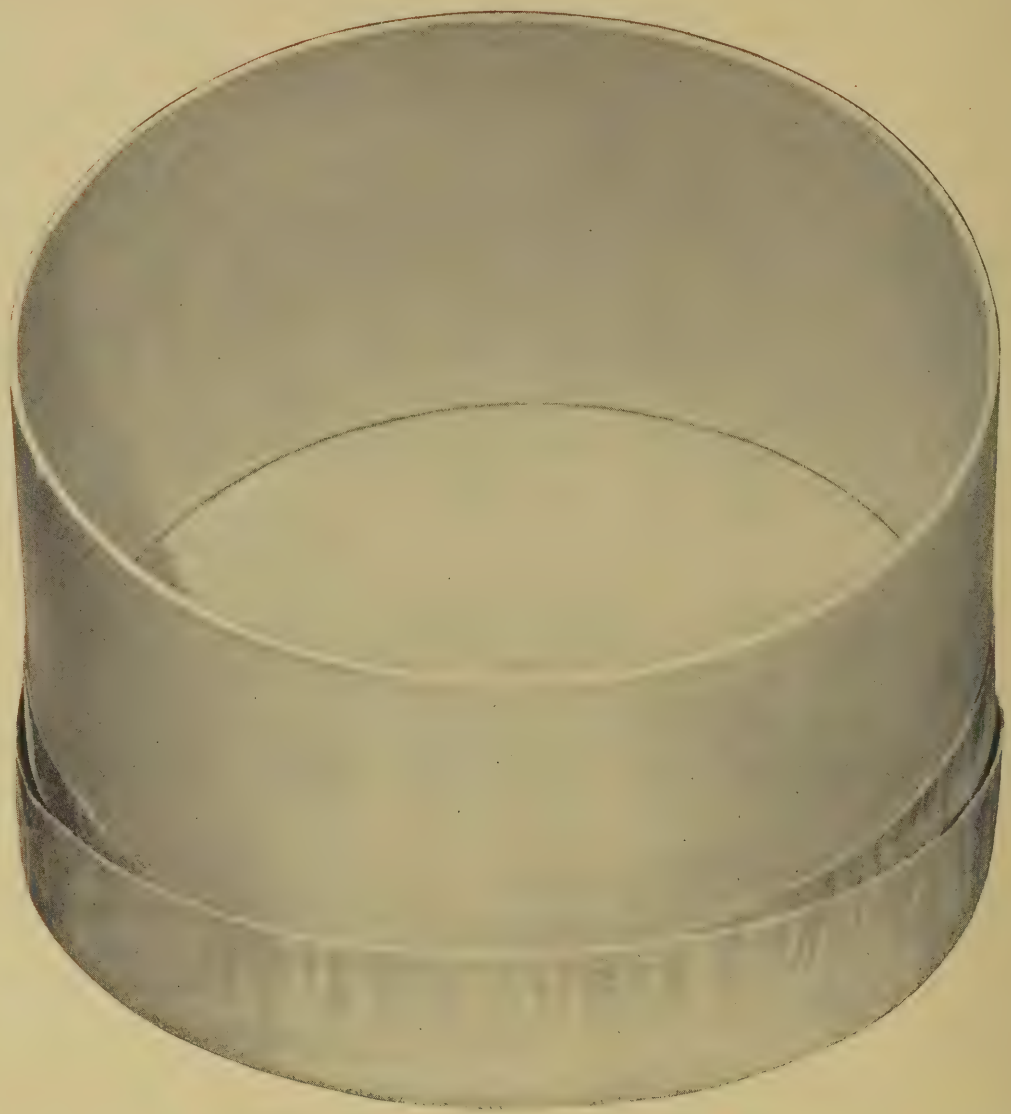
Standardize the Butter Fat and Solids with the Mojonnier Milk Tester

Mojonnier Tester in the splendid plant of Carroll Co., Chicago, where they test all the milk products that are used in the mix, and standardize the mix.

TO BE able to buy your raw materials absolutely on the basis of actual butter fat received—to be able to standardize your ice cream mix to within .05% and eliminates all guess work—these are advantages which you desire for your plant.

With the Mojonnier Milk Tester you can standardize your butter fat and total solids in your mix to within a few hundredths of one per cent. Thus you can control all of the ingredients—butter fat, milk solids (not fat), sugar, gelatine, etc. If your ice cream maker gives your laboratory analyst a sample of the complete mix at 8 o'clock, in forty minutes or less the operator can tell him the exact butter fat and total solids content in the mix.

The Great Hydrox Company advise that the Mojonnier Milk Tester pays for itself every month in the flush season.



With the Mojonnier Milk Tester, you can test, check and absolutely control the factors entering into your overrun. And that kind of accuracy pays big dividends. Write for circular.

Consider The Advantages

The Illustration Shows an H-C Bulk Package "one quart" Container Full Size

The large diameter and shallow depth makes filling easy. Consumers like it because it is easy to empty. Filling direct from Freezer is practical and efficient. H-C Bulk Containers are excellent for filling with Mojonnier Packing Machine. Equally ideal for ices as well as ice cream.

H-C Bulk Package Containers are lined with genuine vegetable parchment paper worked right in with the walls of the container. This makes them leak proof and undisputedly sanitary. No danger of contaminating flavor. Paraffining is unnecessary and permits the use of rubber stamp marks on outside for marking flavor or advertising.

The H-C Bulk Package Containers fit into bulk or brick cabinets equally as well as do containers of less diameter.

Made in Pint—Quart —One-Half Gallon. Full Gallon and Eskimo Pie sizes

Ice Cream Package Section

IN PRESENTING this Special Package Section of The Ice Cream Review we feel that we are touching upon a very important question. The wealth of information that is contained in the following pages has been largely gleaned from men who are wrestling with the problems of caring for The Nation's Dish from the freezer to the consumer's table. These men have first hand information and their opinions and their suggestions should be valuable, not only to other ice cream manufacturers but to the men who manufacture the appliances and supplies used in packaging and handling the product. Even good ice cream loses its popularity when it reaches the consumer in poor condition. The particular form in which it shall reach the consumer is important, but not so important as the condition in which it reaches him. Manufacturers and users of special equipment for packaging and caring for ice cream all have one aim in view, i. e., getting it to the consumer in good condition and in the form that he likes best.

Bulk ice cream is the big seller in this country, but it is just as necessary to package it properly as when sold in other forms. Getting it to the consumer in good condition is a big problem. It must not only be protected from contamination, but it must be kept at the proper temperature — not too soft and not too hard. It must be just right in order to create highest consumption. Good cans, liners, tubs, tub covers and cabinets all play an important part in carrying the ice cream to its destination and keeping it right after it gets there.

Manufacturers of special containers for bulk ice cream are helping to solve the problem of getting the ice cream from the retailer to the consumer's table in good condition. They make it easy for him to respond to the suggestion to "Take Home a Package of Ice Cream."

Ice cream in various other forms is helping to swell the gallonage in most localities and men in the business agree that the sale of package ice cream is going to keep right on increasing from year to year. They realize that increased gallonage will be the result for most manufacturers and that they can develop a profitable package business without seriously decreasing their bulk business.

There is little demand for package ice cream in some communities. This is not the fault of the consumer. The demand must be created. It can be created in any community by putting good ice cream in good packages and getting it to the consumer in good condition. This, however, must be backed up by advertising and herein lies the possibility for any ice cream manufacturer to build up a consumer demand for his particular brand of ice cream.

The larger cities, of course, offer the best opportunities for successfully advertising packaged ice cream under the manufacturer's brand. This does not mean, however, that it can not be profitably done in smaller places. Many are doing it and people in the smaller cities and towns are quite as responsive to effective advertising as other folks.

We believe that some ice cream manufacturers make a mistake, when attempting to push sales of package ice cream, by trying to save money on the cost of packages. A cheap container is a poor investment, especially if your name and brand appears thereon. An attractive container whets the appetite of the buyer for its contents, and if the ice cream is up to expectations, the taste and the memory of the brand is going to result in repeat orders. The same rule holds good in regard to advertising. Make it of good quality. Let the consumer associate your high class advertising with your good ice cream and he will gain the impression that the purity and wholesomeness of your product is beyond question. Gain his confidence to the right degree and he will even pay more money, if necessary, to enjoy your ice cream.

Appreciating the importance of this question of packaging and handling ice cream, we submitted a series of questions bearing on the subject to various ice cream manufacturers in all parts of the country. The compilation of the answers to these questions should be of interest to every reader of the Ice Cream Review. We have emphasized what the answers indicate are the more important questions by a quite lengthy compilation of those answers.

The list of questions as submitted is as follows:

ICE CREAM CANS

1. What is your method of keeping track of empty cans and packers?
2. Please send us any blanks you use in keeping a record of cans and packers that are out.
3. What percentage of cans must be replaced annually?
4. What is your depreciation cost on cans and packers per gallon of ice cream during the year?
5. Do you use liners?
6. Are present cans on the market heavy enough?

A GOOD BEGINNING IS HALF THE BUSINESS.

7. Are you retinning?
8. If so, have you found it profitable?
9. Do you have a state law requiring cans to be rinsed and returned as soon as emptied?

PACKERS OR ICE CREAM TUBS

1. Do you charge retailer with a deposit on packer or cans furnished him?
2. If so, what percentage of the value?
3. Do you charge irregular customers a deposit?
4. If so, what percentage of value?
5. How many trips does a packer make in a year?
6. Have you tried the duplicate checking system, similar to baggage checks?
7. If so, with what success?
   Note—Please send us a sample of check used.
8. Have you tried metal bottoms on outside of tubs?
9. If so, with what success?
10. What improvements can you suggest in building tubs to make them last longer?
11. Do you repair and paint your tubs each year?
12. How are empty cans and packers stored when not in use?
13. How do you prevent rusting of cans in storage?
14. What is the average life of a tub in your business?

ICE CREAM CABINETS

1. Do you loan cabinets, or require retailers to buy them?
2. If you loan cabinets, do you keep them out the year round?
3. Do you furnish larger capacity cabinets in summer and smaller in winter?
4. What terms of rental?
5. What size cabinets are most generally used in your community?
6. Do you charge for icing?
7. If so, on what basis?
8. How often do you overhaul and paint cabinets?
9. What is average life of a cabinet?

CONTAINERS

1. What percentage of your gallonage is sold in bulk?
2. What percentage in brick?
3. What percentage in other containers?
4. Do you use a packaging machine?
5. If so, is it satisfactory?
6. What special effort have you made to encourage the consumer to "Take Home a Package of Ice Cream"? **Note**—Kindly send us samples of advertising that has pulled best. Is the growing tendency to put ice cream in cartons and sanitary containers building up a greater gallonage in your community?
7. If you pack a special container, ready for the consumer to carry home, do you experience any trouble in getting the retailer to properly care for it?
8. Is such a container building a satisfactory trade for you?
9. Which business do you prefer, bulk or package?
10. Why?
11. Have you tried iceless containers for shipping?
12. If so, with what success?
13. Have you tried to increase your sales of package ice cream through grocery or chain stores?
14. If so, with what success?

Ice Cream Cans.

Question No. 1 under this section reads, "What is your method of keeping track of empty cans and containers?" This is of interest because of its direct bearing upon keeping down the cost of distributing the ice cream, and its consequent effect upon the percentage of profit.

In smaller towns where the number of customers is not so great, a duplicate tag system is in most common use. This simply gives a record of the number of cans that are out, but does not record where they are. However, most of these manufacturers do not feel that it is necessary to keep a more complete record than this.

A development of this system which is in use in larger plants is a duplicate checking system in which the can or packer is tagged with a check similar to a baggage check, and the stub or duplicate check retained. In the most thorough instances of the use of this method, the can is numbered, and a corresponding number entered upon the check, with the customer's name. This tells the whole story at a glance, even to the size of the can, for in most cases where the cans are numbered a letter is prefixed to the number which indicates the size and type of the can.

Another system in common use is the duplicate card system, with one card for the customer and one for the tub. When a tub is taken out, the number is entered on the customer's card, and the customer's name on the tub card. When the tubs are returned the customer is automatically credited by posting from the tub card.

Another firm uses a ledger sheet for record, every customer being charged with the packers he gets. Each sheet is numbered, as A1-A2-B1-B2-C1-C2, etc. In the back of the ledger is an index. If packer 637 goes out to B2, then B2 is placed in the out column under 637. If 637 is returned without a tag, then by referring to 637, it will be found that B2 is due credit for this packer. This firm reports that this system is the most satisfactory of several they have tried.

A Nebraska firm numbers every tub and enters the number under the dealer's name. If the records do not show that it has been returned in a week, the dealer is notified and an invoice is mailed. If after seven more days the container has not been returned it is charged to his account, and an invoice is mailed. This plan has worked very satisfactorily, for after a year's trial of this system it has been necessary to charge only two dealers with the cans, and after the invoice was sent to them, they were returned at once.

A unique and simple system is used by a North Carolina firm. A large board is placed in the shipping room with the numbers of the packers on it. A nail is driven under each number. When a packer goes out a duplicate check with the number, name of buyer, date and amount is filed on this board. Every packer that comes back is checked off on this board. The others are written to within a reasonable time.

One firm keeps track of the cans through the route men. Each man is charged with the number of cans he takes out, and is credited with the empties returned. The commissions paid to the route men are based on the empties returned.

An effective method employed by another North Carolina firm is the use of a numbered salesbook. The customer's name and other data are entered in the salesbook, and the number of the order entered on the tag, a duplicate of which is kept at the office. By referring to this duplicate and then to the original order, the cans that are not returned can be easily traced.

A Wisconsin firm is very enthusiastic over the system they have in use, having tried several methods and found this one most advantageous. They have a slotted board which is numbered to correspond with the numbers on the tubs. For tubs and packers that are sent out by express, red, white and blue tags are used consecutively, one color for each month. We presume that the customers' names are entered on these tags. For all deliveries not made by express, yellow tags are used. Thus at a glance they can tell how the tubs and packers are coming back.

To insure prompt returns, one Missouri firm makes a demurrage charge on all cans and packers that are out over ten days. The depreciation cost and replacement percentage of this firm is very low, therefore this system must be very satisfactory in keeping down distribution expense. However, we cannot help but feel that in territories where competition is severe, this system might react very unfavorably upon the volume of sales.

Numerous other systems are in use which are slight variations of the methods above named. The need of

Nelson (Patented) Ice Cream Cabinets

"Confessed The Best When Put to Test"

are constructed along scientific and practical lines to conserve ice and salt supplies and keep the ice cream in perfect condition until sold. The manufacturers have devoted thirty years of study and experiment toward the building of the best possible ice cream cabinets for the manufacturing trade. Each particular make of cabinet of the Nelson line is sold with a guarantee and on a plan of "You Must Be Satisfied"

some simple, efficient system was expressed by several manufacturers, and it is hoped that the suggestions contained in the foregoing paragraphs may prove helpful.

Question 2—What percentage of cans must be replaced annually?

The average percentage was 20, with a number at 15 and many at 10. Only a few were above 25, and these ran as high as 33 1-3 and in one case 40 per cent. On the other hand, quite a number were below 10 per cent, many as low as ½ of 1 per cent.

It was noted that in some cases where the percentage ran exceptionally high there was no accurate system employed for keeping track of containers. This would seem to indicate that considerable loss can be incurred by carelessness on the part of dealers in returning the cans. Of course, there are other causes which contribute to the cost of replacement, which the answers to later questions will show.

In practically every case where the replacement percentage was extremely low, every precaution was taken to insure the return of the cans. The containers were well taken care of in other ways too, but this fact was particularly noted.

Question 3—What is your depreciation cost on cans and packers per gallon of ice cream during the year?

Most manufacturers figured the depreciation as a percentage of the total investment in cans and containers. In such cases it averaged 20 per cent, with a few as high as 33 1-3 per cent.

Where the figures were given as a percentage of the cost of a gallon of ice cream, they showed great variety, ranging from ½ of 1 cent to 7c on a gallon. A very few were above 7c, and the general average was 2c.

This percentage ran in direct ratio to the percentage of replacement as referred to in the previous question. Where one was high the other was, and vice versa.

Question 4—Do you use liners?

Answers to this question were quite evenly divided. Out of 145 manufacturers who replied to this question, 71 used the liners and 64 did not.

In a great many cases the liners were used only on "second season" cans, or on cans that were a trifle rusty. A few manufacturers reported that they used the liners with chocolate ice cream only. No reason was given for this practice.

Question 5—Are present cans on the market heavy enough?

Most manufacturers seemed to feel that the cans were heavy enough, for out of 92 replies to this question 84 were in the affirmative. However, many of the affirmative replies contained reservations to the effect that only the more expensive grades of cans were, and that too many were made to fit a cheap price. Also a great many said that, though the cans as a general thing were heavy enough, the tinning was too light and wore off readily, causing the can to rust. It was from this source that the greatest loss on cans was incurred.

One criticism of the construction of the cans at present on the market was that the rims were not heavy enough, especially at the top, as heavier rims would facilitate handling.

Question 6—Are you retinning?

Of 129 manufacturers who replied to this question, 71 were retinning and 58 were not. One manufacturer said that he had been, but as cans declined in price he had discontinued, as it was more satisfactory to replace the cans than to send them away for retinning, due to the high freight rates.

Question 7—If so, have you found it profitable?

Of 62 replies to this question, 45 were in the affirmative. The main reason for stating that retinning did not pay was that the transportation to and from the tinners ate up all the savings that were made by having the cans retinned. In the case of soldered cans, it was found in most cases to pay only when the can was finished with the same sanitary seam as the new ones.

A few manufacturers said that with cans at their present low prices it was not found to be as profitable to retin as it was when the cans were higher priced.

The others were almost unanimous in saying that retinning did pay, if it was done well, because it lengthened the life of the can by preventing rust, and consequently lessened the percentage of leakers. It also gave a better, more sanitary appearance to the cans, and made it unnecessary to use liners.

The general consensus of opinion of the majority was that it did pay provided the cost of retinning, transportation included, was less than half of the cost of the can. Practically all large plants that had their own retinning machines found that it paid.

Question 8—Do you have a state law requiring cans to be rinsed as soon as emptied?

The following states from which replies were received have such a law: Texas, Kansas, Nebraska, Tennessee, New York, Montana, Georgia, Washington, Wisconsin, North Carolina, Mississippi, Oklahoma, Virginia, Colorado, Illinois, Missouri, Louisiana, Iowa, California, North Dakota, Michigan, Minnesota, Indiana, Massachusetts, Pennsylvania and West Virginia. Replies from states which have no such law include Kentucky, Maryland and Connecticut.

However, it would seem that in most cases where

"The Package Sells the Goods"

IT IS EASIER TO GIVE ADVICE THAN TO LEND A HAND.

such a law exists it is not enforced. In fifteen states this condition was reported to be in existence. One North Carolina manufacturer said he believed that the enforcement of this law would save thousands of dollars a year for the manufacturers on account of lowering the percentage of depreciation on cans. When such a law as this exists, the enforcement of which would tend to decrease the manufacturing cost of ice cream, and which at the same time encourages sanitation and thus has a beneficial effect on the public health, it is difficult to understand why its enforcement is not insisted upon.

* * *

PACKERS, OR ICE CREAM TUBS.

Question 1—Do you charge retailer with a deposit on cans and packers furnished him?

Most manufacturers evidently do not find it necessary or good policy to charge a deposit for cans and packers, for out of 146 manufacturers who replied to this question, 132 did not charge a deposit and 14 did.

One manufacturer reports that he is now using 1-trip waxed manila carrier pails, which cost him 10c each. These pails hold the cream in good condition for about eight hours. It was not stated, but it is presumed that these pails are used in the tubs in place of the cans.

A few manufacturers state that they do not charge a deposit, but if the dealer does not return his cans and packers within a reasonable length of time he is billed for them. One manufacturer charges a deposit on city trade only, it being easier to keep track of cans and packers shipped out by express. One Washington manufacturer who has quite a bit of Alaska trade charges his Alaska customers only for packers, crediting them when they are returned.

This Book Tells How

HOW to cut down your percentage of solids fat and at the same time improve the quality of your cream — when and how to most successfully use cream, sweet butter, condensed milk or powdered milk—how to make brick ice cream without redipping—how to increase your overrun — most successful brine temperatures —best methods of using gelatine — proper sugar proportions in relation to quality and overrun—savings and improvements possible by correct use of ripeners.

These are just a few of the subjects covered in Mr. Thomas' "Profitable Ice Cream Making." Page after page is devoted to this kind of valuable, profitable, useful information. It is a book that you cannot afford to be without. Order yours now.

The price is only $1.00 postpaid

J. G. Cherry Company
Dept. 301
Cedar Rapids Iowa

A North Carolina manufacturer says that if the sanitary law which requires that tubs be rinsed and returned directly after using were enforced, it would cover this situation and it would not be necessary to charge a deposit.

In most cases where a deposit is charged to regular customers, it is charged only when ice cream is delivered to an address other than the retailer's own.

Question 2—If so, what percentage of the value?

Most manufacturers charge full value or the cost of the container, which gives them full protection in case of loss. Some charge a flat rate of from $1 to $3, and others charge various percentages of the value ranging from 10 to 75 per cent. One manufacturer charges a fixed rate of $3.50 for 1, 2 or 3 gallon cans and $5 for 5 gallon cans.

Question 3—Do you charge irregular customers a deposit?

Manufacturers who answered this question were almost evenly divided in their reports, 78 of them charging a deposit to irregular customers and 69 of them not doing so.

It was noted that almost all of the manufacturers who were located in the larger cities charged a deposit, while those who were located in smaller towns did not. In almost all cases, especially in larger places, a deposit was charged when the ice cream was taken out to picnics, conventions, and similar gatherings where there was no efficient system of keeping track of the packers, hence a greater risk of loss.

The main reason for not charging a deposit, especially in smaller places near the large cities, was that competition was so keen that there was a great danger of loss of trade is such a charge was made.

Question 4—If so, what percentage of the value?

Answers to this question showed such a great diversity that it seemed almost as if every individual manufacturer made a different charge. The various percentages of the value charged ranged from 20 per cent to full value, and the flat rates ranged from $1 to $5.

One manufacturer charged sufficient to cover the expense of sending for the packer if it was out of the regular delivery zone. There seemed to be no general method employed for making this charge. Rather, it seemed to be an arbitrary matter, the decision of which is influenced by the local conditions found by each manufacturer.

Question 5—How many trips does a packer make in a year?

These answers also showed a wide diversity, and it is difficult to determine an average, due to the fact that quite a few firms do not manufacture ice cream in the winter.

In large city plants where a year round business was done, the number of trips made by packers used in city trade ranged from 100 to 200, and in country trade from 35 to 40. In smaller towns the packers made from 15 to 50 trips on local deliveries and from 1 to 20 trips on express deliveries.

In this connection one manufacturer says: "We have been in business 50 years, and I believe we still have a few packers left that Dad started with." If the manufacturer of these tubs is still making them as hardy as this, he has advertising material here that will put all other makers out of business. Probably the original Old Oaken Bucket is among them.

(Continued on page 76)

BUILT Better Because Built With The Craftsman's Pride—

The true reason for the pronounced supremacy of the "No-Swet" ice cream cabinet is more than a matter of inventive genius.

Into the "No-Swet" cabinet goes the carefull painstaking workmanship, the constant striving for perfection of the creator and the craftsman working hand in hand to make their dream become a practical reality. Thus, this pride, united with modern business ability, and efficient production has made it possible to offer the ice cream manufacturer of today a cabinet that is unequalled in every respect.

"No-Swet"

The Swet-less Cabinet

Built on the principal of the thermos bottle, adopted and used exclusively by many of America's largest ice Cream manufacturers.

"No-Swet"

Ice Cream Cabinet

Positively guaranteed to keep ice cream in perfect condition from 24 to 30 hours with one packing, if it does not, return at our expense, and we will refund purchase price.

Without obligation, we will be pleased to send detailed information regarding these cabinets. Write for it today.

The Future of Brick or Package Ice Cream

Address of K. L. CARVER, Before California and Southwestern States Ice Cream Manufacturers' Ass'n

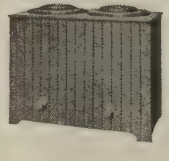
THE manufacture and sale of ice cream can hardly be considered as any other than an "infant industry." I venture that no other industry, with the possible exception of that built up around the "automobile" has developed to such a magnitude in so short a period of time. It is estimated that 250,000,000 gallons of ice cream will be used during 1921 in the United States alone, which, at wholesale prices, would represent a money exchange of approximately $25,000,000.

The American public has taken to ice cream like "a duck to water." Neither highly efficient production nor scientific and intensive merchandising have been required to sell it. If such had been the case, the ice cream industry of to-day would show a far greater development along those two lines.

Conditions during and following the war period nave been most decidedly favorable to ice cream manufacturers. Our commodity is perishable and is made and sold almost from hand to mouth, so we have not been obliged to carry large stocks with the hazard of a declining market; and we have received consistently good prices for our merchandise, being more or less protected until quite recently, from the advent of new competition, by the high price and scarcity of ice cream equipment. The result is that most of the firms in business to-day are well organized, well financed and apparently thrifty, (the only exceptions being in a few localities where ruthless and useless price wars have been and are being waged.

There is no question, however, but that we are now facing a new era in our business—an era in which efficiency is going to play one of the leading rolls. Our history has been one of constant rebuilding, remodeling, enlarging and re-equipping, and the continual adding of tubs, cans, cabinets, freezers, delivery trucks, hardening rooms and such simple necessities for conduct of our business. But the noticeable downward trend of all prices, the curtailing effect of wage reductions on household expenditures and the competition being attracted by the apparent success of ice cream manufacturers indicate that we must pay more attention to every form of economy and efficiency in order to be able to meet the inevitable price readjustments of the future. Compare in your mind the efficiency in the modern ice cream plant with that in a modern printing establishment, in a large textile mill or in an up to date shoe factory. This illustrates one of the reasons why I consider that the ice cream industry is still in its "infancy." The ice cream freezer and the ice cream dry hardening room are almost the only parts of our equipment that have been developed entirely within our own industry and they are both comparatively simple in principle and construction. We owe our newest type of storage and mixing vats to the brewing industry, our refrigeration machinery has been developing through a long period of years in various industries, the Babcock testing apparatus and the homogenizer are the outgrowth of the milk industry and so on down the line we go. Having temperature, flavor, texture, appearance and extreme perishability to contend with, our problems are more or less complex, but as the printer, the weaver and the cobbler have designed and wrought the wonderful pieces of machinery we see in their institutions, so can ice cream manufacturers construct equally efficient equipment for their own factories if they will only put their minds to it. A continuous freezer (which, by the way, is being developed by Fred Martin, of Portland, bids fair to revolutionize ice cream freezing) an automatic overrun regulator, automatic can fillers and washers, conveying systems for handling full and empty cans, brick making machines, automatic ice and salt mixing machines for tub packing, mechanically refrigerated truck bodies, cabinets and soda fountains and automatic ice cream vending machines are all within the very conservative range of possible development and perfection.

The subject of brick or packaged ice cream is at present receiving a good deal of attention because of the placing on the market of two or three different types of brick or packaging machines. I do not want to speak too discouragingly of these machines, but I do believe that the better principles of the several machines will have to be combined and the packages somewhat modified and standardized before the results will be entirely satisfactory. It is gratifying, however, to note the number of machines designed to fill various of the above needs that have been placed on the market within the last few months. We have yet to find out just how effective or practical they will prove, but it certainly indicates that the era of rapid mechanical advancement and development of efficiency is at hand.



Now, as to our merchandising. We have as yet made only a fair sized dent on the surface of our possibilities. The older companies came into being in the larger cities where plenty of business lay close at hand or within easy shipping distance. The development and exploitation of the soda fountain really did more to increase ice cream sales than any effort put forth by the ice cream manufactures themselves. Next came prohibition and the re-

THE TROUBLE WITH SOME BUSINESS MEN IS THEY ARE NOT SET TO GO.

placement of the saloon by confectioneries and soft drink parlors. Our own sales work has been more in the nature of keeping business away from or actually taking it away from our competitors, than in developing more or new lines of consumption. Volume has been a more detail to us because our gallonage has come too easily. I am not claiming that the ice cream man's berth is a "bed of roses" but I do claim that we can congratulate ourselves in that our market has in a measure presented itself, grown of itself, or has been enlarged by and fostered by other lines of business. Self-preservation has not forced us to go out and seek and develop our own market.

Much could be said on the merchandising of ice cream but I am going to limit myself to just three phases of the subject, phases that I believe, are prying at the door of a future that will surprise us and that will ultimately lead to a fuller exploitation of brick or packaged ice cream.

First. Closer co-operation with the dealer in selling ice cream.

Second. The development of home consumption of ice cream.

Third. The development of individual package consumption of ice cream.

First, take the matter of co-operation with our dealers. We advertise our ice cream through our dealers' stores; we furnish them with signs; we give them "specials" for holidays; we deliver private orders for them; we supply them with menus and I have even heard of giving them fresh ice for their "coils," all to convince them that we want to co-operate with them. Yet we overlook the importance to them of knowing and to us in having them know what their margin of profit actually is. Too often their measure of the quality of an article is based upon the profit they can realize on its turnover. Thus, variation of overrun is a very potent factor in their determination of quality. You can give a dealer ice cream that is perfect according to your own individual standards ninety-nine times out of a hundred, but you cannot avoid under the present methods involving human attention and regulations giving him a "light" or "high overrun" can once in a while, and it is upon such a faulty can that the reputation of your ice cream, and your dealer's willingness to push its sale, are dashed to pieces. This is particularly true in dipping ice cream for carry-home trade which, as I stated above, is the direction in which our future lies, rather than in fountain use. In sodas, sundaes and cones the portions are so small and profits so large that the shrinkage, or rather the variation in shrinkage, is lost sight of. In making a test to prove to the dealer that your ice cream shows only a nominal shrinkage of perhaps a pint to the gallon, you use an average can, while it is human nature for him to base his figures on the worst can he has received. Nevertheless, I confess that I have a good deal of sympathy for the dealer. As a rule his figures are not so far off because he has the human equation and labor problem to contend with exactly as we have in our own business. The sum and substance of it all is that the dealer does not like to handle bulk ice cream, incidentally because of its inconvenience, but primarily because regardless of the facts, he is convinced in his own mind that he cannot get a fair margin of profit out of it. A principle of merchandising and commerce, as sound as the Rock of Ages, is—"give the customer what the customer wants." We do not wish to sell ice cream by weight, so it is high time then, that we select one of two alternatives: develop a positive means of regulating over-run—prove to our dealers that this has been successfully accomplished and then assist by the simple process of education, in stabilizing their margin of profit on bulk ice cream, or better yet, develop a satisfactory and economically prepared form of brick or packaged ice cream—sell it as cheaply as possible, then by intensive advertising make the public want it and buy it in this form.

In considering home consumption of ice cream, one can get a prospective of its possibilities by considering how limited the sales of prepared breakfast foods would be if sold only in lunch rooms, restaurants and cafes and not in packages for home use. Ice cream is decidedly harder to package than "corn flakes" and more difficult to get into the home in good condition for serving, but these drawbacks can and will be overcome sooner or later.

Aside from developing better methods of packaging and forms of packages, we will have to make generous advertising appropriations to educate the public out of the habit of buying bulk ice cream which is wasteful, inconvenient and unsanitary, but we will still be ahead of the game for the proper packaging of food products has always quickly stimulated their sales. You all remember the molasses barrel, the cracker box, the butter tub and the lard can. Today these and many other products crowd the grocers' shelves and fill our market baskets, all in package form.

In discussing the advisability of developing individual package consumption of ice cream, I have occasionally heard manufacturers belittle the idea, claiming that "individual bricks are a nuisance to handle" and that "such sales will get us nowhere anyhow." This is genuine pessimism. Compare it with the courage and foresight of the California Raisin Growers Association in developing the market for their raisins. The merchandising problems confronting the raisin grower were more

nearly parallel to the present merchandising problems of the ice cream manufacturer than anything I know of. A few years back raisins were sold in bulk and in clusters principally for use in cakes and puddings and for the holiday trade. This use most nearly compares with the mere use of ice cream at soda fountains. A remendous advertising campaign was then inaugurated suggesting the use of raisins as a food in the form of raisin pies and in raisin bread with the result that both of these articles are now nearly as common to us as apple pies and graham bread. This step in the development of their problem compares with our efforts to educate the people to use ice cream for an every day dessert and for "a la modes"—as a food and not as a luxury. Next the raisin growers placed on the market in pound packages a select seedless raisin for general use in the home. This kind of raisin put up in this form were handy, economical and ready for immediate use, corresponding exactly to our fertile field of home consumption for brick or packaged ice cream. Again, the earlier method of seeding Muscat raisins mechanically and putting them up in packages was just about as unsatisfactory and inefficient as our present method of brick making by hand. Just recently we have seen the individual package of seedless raisins appear on the market. They have been placed in every grocery store, drug store, candy shop, cigar stand and even in cafeterias and on the trains. The owner of a motion picture show at a beach resort told me recently that every morning he sweeps dozens of empty raisin packages out of his theater. He says they now have the lead over candy boxes, peanut shells and cigar stubs. It is just as possible for us to secure an equally wide distribution and sale for ice cream put up in individual package form. It is daintier, it is as high in food value, and with a little wooden spoon included in each package, it is even handier to eat. Yes, the raisin growers advertise—"Have you had your iron today?" We can advertise—"Have you had your Vitamines today?"

In most localities these little packages of ice cream are gradually appearing for picnic use and for sale in ball parks, theaters and amusement centers, but I believe that the automatic ice cream brick vending machine will be the big factor in the development of this individual package consumption of ice cream. If packages of ice cream could be put out in the open like candy, cigars, chewing gum, nuts and raisins, automatic venders would be altogether unnecessary. They would advertise themselves, they would require but little clerical attention and practically no floor space. The automatic vending machine will overcome all of these difficulties. It can be placed in a small but conspicuous space, the only attention necessary will be the daily repacking and restocking and an occasional emptying of the money box which will, no doubt, prove a surprisingly pleasant task.

Vending machines may be placed advantageously in schools, picture shows, pool halls, dance halls, cigar stands, department stores, depots, factories, Y. M. C. A.'s, amusement piers and parks and in office buildings. They will pick up many a dime that is now being spent for hot dogs, dill pickles, beverages, chewing gum and tobacco and a lot more that are not being spent at all because no ice cream is obtainable at hand. In addition to enjoying the direct increase in gallonage resulting from these sales, the opening of new outlets for ice cream and the widening of our distribution, will tend to develop among the masses and classes alike, a stronger desire and a keener taste for ice cream and a better appreciation of its value as a daily food.

In closing, let me say that the advantages of brick or packaged ice cream are all in line with the accepted principles of good merchandising. Bricks are more sanitary; more convenient and appetizing to serve; easier to get into the home in good condition; handier, less wasteful and more profitable to the dealer—which are important factors, because they have a direct bearing on the dealers willingness to push ice cream sales. They place upon the manufacturer a more complete responsibility for the quality and cleanliness of his product. They permit of a wider assortment and variation of flavors and a better opportunity for the expression of the manufacturers individuality.

The disadvantages of selling brick ice cream are in the line of production and distribution, which fortunately are possible of being overcome mechanically—by devising new types of cartons or packages, by perfecting brick making machines, by developing more efficient and handier methods of cabinet storage, and by the use of automatic vending machines.

While these problems are being worked out, let us lay a foundation for the future by using in our advertising an idea such as "Buy Brick Ice Cream." Why should Mrs. Brown continue to buy dipped bulk ice cream just because Mrs. Smith does.

"IMPERIAL" MANAGER INJURED IN AUTO ACCIDENT.

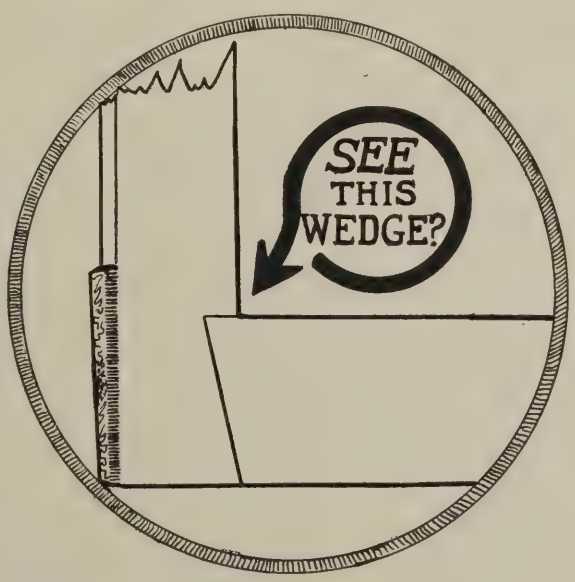
Mr. W. M. B. Sine, general manager of the Imperial Ice Cream Company, Clarksburg, W. Va., spent the early part of May away from his office as the result of an automobile accident. His many friends will be pleased to know that there are no permanent injuries.

WE Have Learned Much in the Past 44 Years

Since 1877 we have enjoyed the distinction of being leaders in the Cooperage Field.

THROUGH years of experience we know the proper seasoning necessary for timber that goes into the construction of containers where the wood comes in close contact with liquids. We fully realize the importance of careful, painstaking workmanship in the life of every ice cream tub and cabinet.

Therefore, every process in the manufacture of Gambrinus Containers is personally supervised by their creator and expert coopers—many of whom have been in our service upwards of a quarter century. This protects the buyer against the carelessness which so often creeps into modern production methods.



THESE important advantages together with many exclusive features in the construction, have made it possible for us to offer you the strongest ice cream tub and cabinet on the market today.

The Strongest Ice Cream Tub on the market.

The Greater the Weight Inside the Tighter the Bottom.

The wedge shape construction of our tubs absolutely prevents the bottom being forced out, while the shoulder or offset also keeps the bottom from going in.

Gambrinus Products in use 36 years— Still in Service.

The life of Gambrinus products is indefinite. A number of our large casks have been in constant service for 36 years and are still giving satisfactory service.

"IF YOU WISH TO BE GOOD, FIRST BELIEVE THAT YOU ARE BAD."—EPICTETUS.

North Carolina Ice Cream Manufacturers' Association

Bulletin No. 1, by A. E. DIXON, Secretary

THIS will introduce another new member, Mr. Harvey C. Hines. Mr. Hines is a very prominent citizen of Kinston, N. C., an ice manufacturer, wholesale grocer and bottler, who now enters the ice cream game.

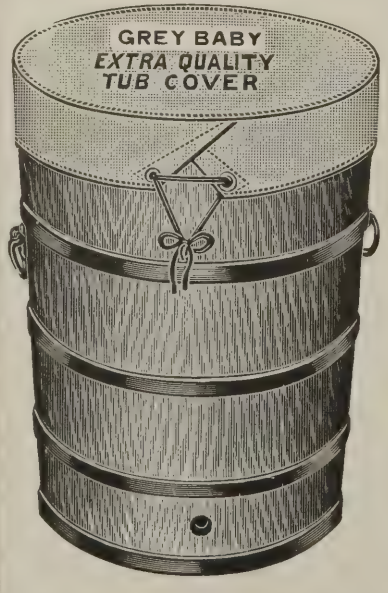
The American Railway Express Co. has a proposition they expect to place before the Interstate Commerce Commission, under certain conditions, as follows:

They ask relief from parties underbilling ice cream shipments, viz, shipping three gallons in five gallon tubs and five gallons in tubs larger than necessary. We feel quite sure none of our members are making this a practice. It is very unfair to the Express Co., and as we wish and hope to secure their co-operation on matters which we do not fail to ask, it is only right that they should be protected in wrong practices. It is also unfair to us that we should be constantly exposed to friction and expensive controversies which this practice will lead to, all over the wrong doing of a few members. Our Association as a body will frown on anything of this sort.

Efforts are being made by Congress to have a tariff placed on Cuban sugar of practically 2c. This will be an increase over the present price of possibly 36%. It is also reported in the same bill that a tariff on salt of $4 per ton in barrels and $3.20 in bulk is proposed. This duty being nearly 100% of the foreign value of salt, the importation of foreign salt will be practically prohibited. As these two articles are used extensively by ice cream manufacturers, it might be well to take this up with your Representatives and Congressmen, although no doubt the Democratic members will oppose it . Anyway, it would be unwise to be caught short.

Only two states prohibit the use of certified coal tar colors, Minnesota and South Dakota. In these states it is absolutely necessary to us vegetable colors.

It was gratifying to receive certain responses to the last Bulletin, and one which might appeal to you is as follows:



"From different reports I am inclined to think there is a possibility that some of our membership is overlooking the question of what costs are in manufacturing ice cream today, based on rates we have of various prices that have been quoted. If it could possibly be done, it occurs to me it would be of interest to have the price list of our various members."

Another:

"May I offer the suggestion that a letter be sent your membership calling their forceful attention to the importance of making an acid test in order to know just exactly what is the acidity of every batch of ice cream before they freeze. This would unquestionably produce more uniform and more regular ice cream. And I think it would be in order for your Association to show the members how to make this test. It is our opinion that the Mann test is the best one. It is so simple to make and yet it means so much to the manufacturer of good, uniform ice cream. The ice cream manufacturer knows where he is at all times if he will just take a few minutes to determine the acidity of his mix before making a batch of ice cream." (Note: The method for operating this test is given on page 82 of this issue.)

The writer will be glad to put you in touch with the company handling this apparatus for making the test.

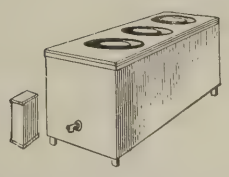
ST. LOUIS, MISOURI

WE EVEN GOT A FREE MEAL.



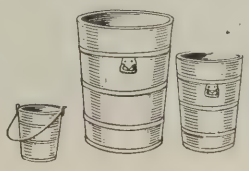
Two Abel Gentleman called at The Review office one day recently. Mr. Abel, of New York City, of "Impruv-Mix" fame, and Mr. Gentleman, of the Russell Stover Co., Chicago, who made "Eskimo Pie" possible, met for the first time and the former's salutation was "I am glad to be Abel to shake hands with a Gentleman." This, in spite of the fact that he had just shaken hands with the editor. But editors can't be sensitive.

These two estimable gentlemen were bubbling over with optimism regarding prospects for the future for the ice cream business. Good looking and dispensers of good cheer, they made the whole office force feel better by their presence. Come again folks.

PERSONALS.

Mr. A. L. Baylor, manager of the engine and boiler department of the James Leffel & Co., manufacturers of steam engines, boilers and hydraulic turbines, Springfield, O., was a welcome visitor in The Review office recently. Mr. Baylor reports business as fine with the Leffel Company and they are working to capacity trying to keep in line with their orders. His work has always kept him quite close to the home office, but due to business demands, Mr. Baylor has been on the road almost continuously lately.

THE C-B-W CALENDAR

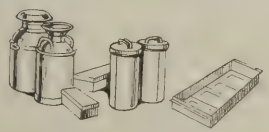


GRAND RAPIDS CABINETS

Grand Rapids Cabinets were manufactured long before the variety of cabinets that flood the market today were thought of, and in spite of this flood of competition they still stand apart and above the others. Comparisons always favor Grand Rapids.

Made in every style, including the Zero brick cabinet; packed with cork insulation; finished with the best grade heavy varnish. Send for cabinet catalog and latest prices.

Cherry Freezer
Equipped with
Thomas Batch Measure



RICHMOND CEDAR TUBS

Virginia white cedar outlasts all other woods for tubs. It resists the brine. Our **Richmond Cedar Tubs** are made of nothing but **Virginia** white cedar.

Clear A-1 lumber only is used; extra heavy galvanized and double riveted hoops on every tub. Handles are made of the finest stamped steel, galvanized.

Buy Richmond Cedar Tubs, painted to your order in three colors if you wish that many. Buy them of us! We have several carloads of standard green painted tubs in stock.

Send for latest price sheet.

Cans, Molds and Slabs. We can give you superior service on ice cream cans, and we can give you real cans, at real prices! With our three large warehouses stocked with cans you stand a better chance of prompt execution of your orders than anywhere else in the east.

Of course, you know about our Superior Brick Molds and Slabs. Our factory in Baltimore is roaring with the additional activity, usual at this time of the year.

There is no reason why anyone who wants the Superior Superware Brick Tanks or Molds can't get them. Our factory is now enlarged to several times its former size.

3 Points in Our Favor

They are:

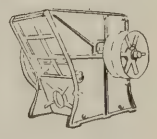
1 Philadelphia
2 Baltimore
3 Pittsburgh

We carry complete stocks and maintain complete organizations in all three cities. Shipping is prompt and convenient in and out of all of them.

By having our three Divisions in these three cities we are in close touch with the entire East and the South. We are the largest organization in the eastern half of the U. S. selling complete ice cream equipment.

In other words, we are **three** jumps ahead. All this of course, is incidental. The best reason for being a customer of ours is: we handle the famous line of Cherry machinery and an unusually high grade of supplies at **fair prices.**

Gelatine Melter



We are proud to be able to supply our customers with the famous Delft Gelatine. It is our policy to furnish our trade the best the market affords provided the price is not unreasonable. Delft Gelatine is not the lowest priced by any means, but it is a uniformly high quality product. You may rely on one barrel being as good as another, and it has strength—weak, cheap gelatines never equal the strength of Delft. Also, Delft Gelatine is practically sterile.

Let us send you the Delft booklet which gives valuable information on gelatine and its uses. Let us quote latest prices.

Our **Hendler Patent Truck** was the first to solve the problem of can handling. That the idea is a correct one is demonstrated by its extensive use in all sizes of plants.

Sturdily built throughout with galvanized steel, it withstands the hard usage such trucks are put to. Many improvements make our latest trucks faultless in every respect.

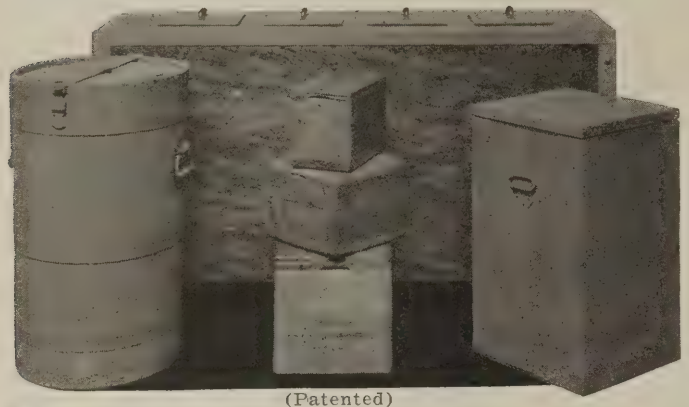
Creasey Ice Breaker

All sizes from hand power to direct motor driven 40-ton an hour size.

SUPERWARE

We urge every ice cream manufacturer who makes brick ice cream (in any quantity) to ask us for a copy of our new Superware Booklet. This 24 page pocket size booklet describes our Superware line of metal specialties, which includes brick tanks, molds, slabs, etc. It is worth your while to know how we make these articles, because they are recognized everywhere as superior and the most desirable ware of this kind to be obtained.

Latest list prices are included in the book.



Just use a postal card. We won't regard your request as an inquiry.

PACKERS, OR ICE CREAM TUBS.

(Continued from page 66)

Question 6—Have you used the duplicate checking system similar to baggage checks?

Manufacturers were about evenly divided in this practice, for of 142 who answered this question 74 used the system and 68 did not. A few manufacturers used it only with tubs sent to other than regular dealers. Several of them used the system in connection with numbering the tubs. The checks were given the same number as the tubs, and part of the check retained at the office. By this means it was possible to keep track of the tub even though the attached check should be torn off.

Question 7—If so, with what success?

Not many of the manufacturers were enthusiastic over this system, the general opinion being that it was the best system they knew of, but unsatisfactory. However, only 14 of those replying expressed themselves definitely to the contrary. The main complaint against the use of the system was that the tags were too easily torn off in transit. The greatest success with the use of this method was reported when it was used in connection with numbering the tubs and giving the checks corresponding numbers.

A few manufacturers preferred a card system, in which the tubs were numbered and the numbers recorded on cards.

Question 8—Have you tried metal bottoms on outside of tubs?

This idea seems to be something entirely new to most manufacturers, for of 128 who replied to this question, only four had tried it.

Question 9—If so, with what success?

Three of the manufacturers who tried these bottoms on tubs found that their use was entirely satisfactory, and the fourth had just begun their use, hence was not in a position to pass an opinion.

Of those who were not using the bottoms, one man said that he imagined the salt brine would eat them up. However, there should not be any more trouble in this respect with the bottoms than with hoops, as they do not come in direct contact with the brine except when it is spilled. Another manufacturer said that he imagined they would make the packer heavy for shipping, and questioned whether it would be a paying proposition when shipping by express, but thought it would be a fine thing for increasing the life of tubs used in city delivery.

Question 10—What improvements can you suggest in building tubs to make them last longer?

The outstanding fault that manufacturers have to find with the majority of tubs that are now on the market is that the bottoms are too weak. It is here that the greatest room for improvement seems to exist. Some suggestion to remedy this fault include the use of metal bottoms or double cross grained wood bottoms, or extra heavy bottom hoops. One suggestion in this connection that seemed particularly good was the use of a bottom hoop that would extend under the tub. With such a hoop, the bottom of the tub would have to be flush with the staves, and the pressure would fall on the hoop when the can is dropped into the tub. This would eliminate the danger of spreading the staves and would reinforce the bottoms as well. Also, it would give protection in shipping without a great deal of additional weight.

Some manufacturers also have trouble with hoops, and suggest the use of heavier iron instead of galvan-

d hoops as a remedy. One man says that he thinks bs should have 1¼ inch bands, 4 to a tub, with the ttom band extra heavy. Another says that most of trouble comes from the rusting of hoops, and says at a tub with rustproof hoops would be worth much re to the manufacturer. He suggests the use of monel tal or some rustproof alloy in making the hoops. An klahoma manufacturer states that he has much better ccess with the use of welded wire than with the ordiry hoops, as in his business they last about four times long. Metal bungholes are also suggested as an imovement.

One manufacturer says he thinks that the bottoms the tubs should be treated with Tarvia or some binder prevent leakage. Another states that the length of e of the tubs would be increased if they were painted th inside and out, and recommends the use of a better ade of paint than is in general use now.

Quite a few manufacturers think that the better ades of tubs now on the market give very satisfactory rvice provided they are given reasonably careful treatnt by dealers. One man recommends standardizing e size of tubs, as he sees no reason for having several zes as is now the case.

The express companies come in for a good share of ndemnation for alleged carelessness in handling the bs. One New York manufacturer's feelings are so ong on this point that he recommends the murder of out half the express messengers. This seems a trifle vere, but reports indicate that something should be ne among express employes and retail dealers for evention of cruelty to ice cream tubs.

Various minor improvements, including the addition canvas tops, etc., were suggested, but heavier hoops d better bottoms seem to be the most desired improvents.

uestion 11—Do you repair and paint your tubs each year?

Of 139 manufacturers who answered this question ly one did not repair or paint his tubs or do both ch year. Some found it necessary to paint the tubs ly every second year, but everyone found it a good an to look over the tubs before storing them and make e necessary repairs.

uestion 12—How are empty cans and packers stored when not in use?

Regarding the storage of packers, some found it derable to store them in a dry place and some in a damp ace. However, there were objections to both methods, when the tubs were placed in dry storage they were ry likely to leak when they were put into use again, d if they were stored in a damp place the hoops were danger of rusting. The best method, one that would em in part to overcome the latter difficulty, was to oil grease the hoops before storing them in a damp place.

In many cases the cans were simply placed in a dry om. Some manufacturers greased or oiled the cans fore storing them, or put newspapers in them to abrb the moisture. A few painted the outside of the ns.

Tubs, as a general rule, were stacked on the floor, ly a few manufacturers using skeleton racks or elves. Cans were generally placed on shelves or on cks.

One manufacturer who found it desirable to econize on space piled the tubs on their sides and put a n in each tub, filling the surrounding space with per. In this way it was not necessary to disturb the

"Packaged Ice Cream"

Rogers

Automatic Ice Cream Brick Maker

Compare the present bulk ice cream cabinet with the old fashioned cracker barrel, —reaching below the counter, removing the lid, scooping out the crackers. This is done today with ice cream in thousands of stores—but—just endeavor to buy a bag of bulk crackers. You can't do it, not because Boards of Health forbid it, but because manufacturers of crackers have made it impossible. They force the public to buy a Sanitary package.

The public protested in the beginning but they like it now, and so they will with Packaged Ice Cream.

This is an age of neatness, cleanliness, healthfulness, in fact, a Packaged Age, and what is true of all packaged food stuffs is true of ice cream. The day of bulk ice cream for the consumer to take to his home is past, and in its place has come the cleanly, wholesome looking, attractive, neat, quickly handled Package —the BRICK ICE CREAM.

PACKAGED ICE CREAM can now be put into the hands of the consumer without raising the price and the dealer can at the same time have larger, surer profit — a profit that he cannot get out of bulk ice cream.

PACKAGED ICE CREAM goes to the consumer in the original package, having never been opened, handled, etc., in its journey from freezer to table.

JOHN W. LADD COMPANY

"National Approved Ladd Distributors Specialties"

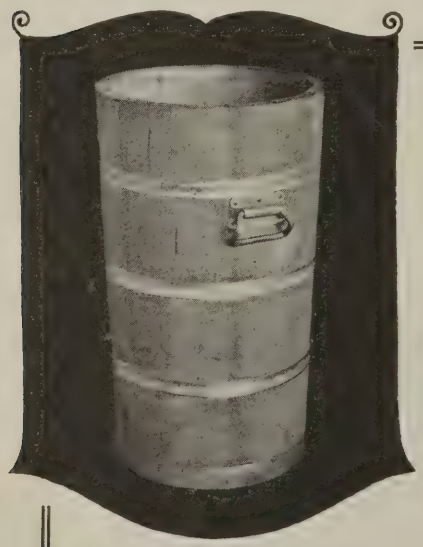
DETROIT CLEVELAND

PAPER VESSELS ARE POPULAR FOR SANITARY CONTAINERS.

tub in order to remove the can. Others who wanted to save space nested the tubs.

A Wisconsin manufacturer who is very thorough in his methods, repairs and thoroughly paints his tubs inside and out, stencils and numbers them and treats his cans the same way except that he paraffines the cans instead of painting them. This man's depreciation percentage was very low.

Question 13—How do you prevent rusting of cans in storage?



The main requisite for keeping cans from rusting seems to be to keep the room in which they are stored as dry as possible.

A great many manufacturers oil or grease the cans before storing them, with good success. Several paint the cans on the outside, and a few dip them in hot tallow. Some manufacturers find the use of newspapers sufficient to absorb any moisture that might cause rust. One manufacturer stores his cans in sawdust, but with only a moderate degree of satisfaction. A few manufacturers use a grease called No-Oxide, and one man applies this with a revolving power brush which he had made specially for this purpose.

One man says that he has no trouble in keeping the cans from rusting while they are in storage, but finds that the customer who lets the cans stand around dirty is responsible for the rust.

With all precautions, some find that it is almost impossible to prevent a little rust. A consensus of the experiences expressed in the replies proves that tendency to rust is reduced in proportion to the extent in which moisture is kept from direct contact with the metal.

FOUNDED 1849

TEXAS ASSOCIATION CONSIDERS PLANS TO REDUCE MANUFACTURERS' EXPENSES.

An invitation is extended by Secretary A. J. White to the members of the Texas Ice Cream Manufacturers' Association to write him stating their ideas on the subject of reducing cost and expenses to the manufacturer by eliminating or remedying harmful trade practices that tend to keep up the price of ice cream. It was recently proposed to the Association to eliminate one needless source of expense by charging the country dealers for tubs, the dealer to re-charge the company when the tub was shipped back. In this way the Express Company would be responsible for the safe return of the tubs, and claim could be entered for it if it was lost.

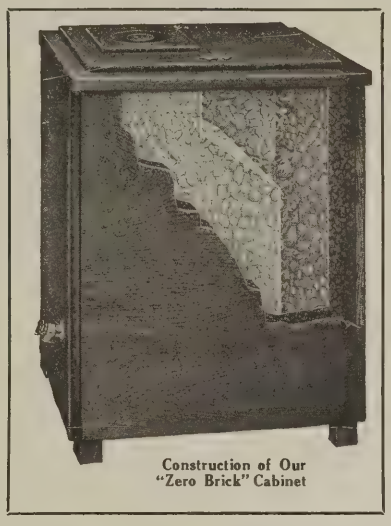
A. J. WHITE.

Realizing the importance of the effect of this and similar harmful trade practices in keeping up the cost of ice cream, Mr. White says:

"Aren't such questions worthy of most careful consideration? Every other manufacturer in the country who ships his product in containers makes a charge for such containers. The ice cream men say that when it comes to charging for cans and tubs on country shipments, it cannot be done. They will advance plausible reasons why such a move cannot be put into effect. Such arguments can be answered by the same reply we give to similar arguments in our organization; that is, we are not interested in reasons why such and such a thing can't be done, but what we want to know is how can it be done. If we attack a problem with our minds made up that it can be done, it invariably will be done.

"The Secretary asks that every member realize that he is a part of the Association, and that if the Association becomes a helpful force, it will be the result only of the effectiveness of the members' efforts. No one man can carry the load, and no one man intends to. Feel free to write the Secretary on any of the foregoing subjects as they appeal to you, or recommend others to be discussed.

"We sent to all members a list of associate members who attended the Fort Worth Convention, and all these fellows are good live salesmen. They are boosters for our Association and we should reciprocate by patronizing them whenever it is possible to do so. Keep the list before you and when they call on you let them know you are thinking about them, and thank them for their co-operation.



"Everyone learned to do his bit during the war. Now help put your Association over and do it big."

We have no business to spend years of valuable time in idle wondering if it will pay to know more. I believe the time has come when we should deal with facts as if they were facts.—Hoard.

Mann's Test for Acidity of Milk and Cream*

By Farrington & Woll

THE acid in milk or cream is measured by using an alkali solution of certain strength, with an indicator which shows by a change of color in the milk when all its acid has been neutralized. Any of the alkalies, soda, potash, ammonia, or lime can be used for making the standard solution, but it requires the skill and apparatus of a chemist to prepare it of the proper strength. A tenth-normal solution of caustic soda is the alkali solution used most frequently in determining the acidity of milk, and is the solution labeled Neutralizer of the Manns' test.

Normal solutions, as a general rule, are prepared so that one liter shall contain the hydrogen equivalent of the active reagent weighed in grams (Sutton). Caustic soda (NaOH) is made up of an atom each of sodium (Na), oxygen (O), and hydrogen (H); its molecular weight is therefore

$$\begin{matrix} 23+16+1=40 \\ \mathrm{Na\ \ O\ \ H} \end{matrix}$$

A normal soda solution then is made by dissolving 40 grams of soda in water, making up the volume to 1,000 cc.; a one-tenth normal solution will contain one-tenth of this amount of soda, or 4 grams dissolved in one liter. One cubic centimeter of the latter solution will contain .004 gram of soda, and will neutralize .009 gram of lactic acid. The formula for lactic acid is $C_3H_6O_3$, and its molecular weight is therefore $3\times12+6\times1+3\times16=90$.

* This is the test referred to in Bulletin No. 7, of the North Carolina Ice Cream Manufacturers Association, printed on page 74 of this issue.

A tenth-normal solution of lactic acid contains 9 grams per liter, and .009 gram per cubic centimeter.

The indicator used is a solution of phenolphtalein, a light yellowish powder; its compounds with alkalies are red, in weak alkaline solutions pink colored, while its acid compounds are colorless. The phenolphtalein solution used is prepared by dissolving 10 grams in 300 cc. of 90 per cent alcohol (Mohr).

In testing the acidity of either milk or cream it is necessary to measure out with exactness the quantity of liquid to be tested; Manns recommended using a 50 cc. pipette. This amount of milk or cream is measured into a clean tin, porcelain or glass cup, a few drops of the phenolphtalein solution are added, and the neutralizer (or alkali solution) is cautiously dropped in from a burette, the point at which the solution stands before any is drawn off being noted. By constant stirring during this operation it will be noticed that the pink color formed by the addition of even a drop of alkali solution will at first entirely disappear, but as more and more of the acid in the sample becomes neutralized, the color will disappear more slowly, until finally a point is reached when the pink color remains permanent for a time. No more alkali should be added after the first appearance of a uniform pink color in the sample. This color will fade and gradually disappear again on standing, owing to the effect of the carbonic acid of the air, to which phenolphtalein is very sensitive. The amount of the alkali solution used for the test is then obtained from the reading on the scale of the burette. The per cent of acid in the sample is calculated by multiplying the number of cc. of alkali solution used, by .009 and dividing the product by the number of cc. of the sample tested, the quotient being multiplied by 100.

$$\text{Per cent acidity} = \frac{\text{c.c. alkali} \times .009}{\text{c.c. sample tested}} \times 100$$

If 50 cc. of cream required 32 cc. of alkali solution to produce a permanent pink color, the percent of acid in the cream would be

$$\frac{32 \times .009}{50} \times 100 = .58 \text{ per cent.}$$

A part of this calculation may be saved by using a factor for multiplying the number of cc. of alkali added in each test. This factor is obtained by dividing .009 (the number of grams of lactic acid neutralized by one cc. of alkali solution) by the number of cc. of sample tested, and multiplying the quotient by 100. If a 50 cc. pipette is used for measuring the sample to be tested, the factor will be $(.009\div17.6)\times100=.018$; if a 25 cc. pipette is used, the factor will be $(.009 \div 25) \times 100 = .036$; and if a 20 cc. pipette is used, $(.009 \div 20) \times 100 = .045$ will be the factor to be applied in calculating the per cent of acidity, the number of cc. of alkali used being in all cases multiplied by the particular factor corresponding to the volume of the sample tested.

If a Babcock milk test pipette is used for measuring the milk or cream to be tested for acidity, the factor will be $(.009 \div 17.6) \times 100 = .051$. This so nearly .05 that sufficiently accurate results may be obtained by simply dividing the number of cc. used by two; the result will be the tenths of per cent of acid in the sample tested, e. g., if 17.6 cc. of cream required 12 cc. of one-tenth normal alkali to give a pink color, then the

The Hutchinson Company say: "We are more than pleased to give them this recommendation, for we certainly have nothing but the highest praise for them."

The Hutchinson Ice Cream Company of Cedar Rapids, Iowa have five 400-gallon Elyria tanks, used for storage, pasteurization and mixing of the Ice Cream mix.

Pasteurize in Elyria Glass Lined Pasteurizers

ELYRIA Enamel—a preparation evolved from hundreds of experiments to find a grade high enough in quality to bear the Elyria name is fused into welded steel containers. Elyria Pasteurizers are equipped with silver flush outlet valve, recording thermometer and other improvements which insure sanitation, easy of operation and efficiency service.

Free Booklet

This illustrated booklet on Elyria Equipment for the Ice Cream plant, together with a complete description of the Elyria Pasteurizer, will be sent to you upon request. Write today.

The mix is agitated during the pasteurizing process by a propeller agitator driven by two-speed electric motor fastened directly to the tank or by belt drive from shafting.

Heated in from 20 to 30 minutes by low pressure steam in the jacket; held at 145 degrees for 30 minutes, and partially cooled by spray coil forcing brine on the outer surface of the inner tank.

Elyria Pasteurizers are being used successfully for heating only, or for heating, holding and partial cooling. They are adaptable to any system, and are installed in the plant by an experienced engineer.

Supplementing Elyria Pasteurizers and other Ice Cream plant equipment is a completely equipped Laboratory and Research Department to co-operate in improving your product or your plant routine.

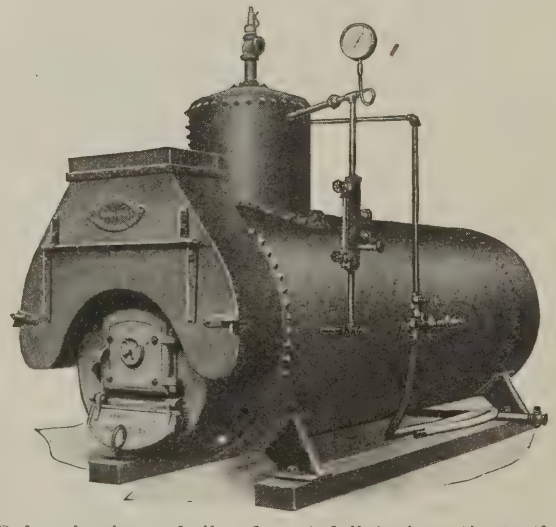
An Elyria representative can prove why and how Elyria Pasteurizers are superior to any other kind you can install. A man can reach you in less than two days time—at no obligation whatever. When may he call?

ELYRIA ENAMELED PRODUCTS COMPANY, ELYRIA, OHIO

Pittsburgh New York Chicago San Francisco Boston Los Angeles
Indianapolis Minneapolis St. Louis Canadian Milk Products, Limited, Toronto, Ont.

per cent of acid is 12 ÷ 2 = .6 per cent. If one-fifth normal alkali is used for testing, the per cent of acidity is shown directly by the number of cc. used (Vivian.)[1]

The apparatus and chemicals needed for testing the acidity of milk or cream by the so-called Manns' test include one gallon of a one-tenth normal alkali solution; four ounces of an alcoholic solution of phenolptalein, a 50 cc. glass burette stand, and a pipette for measuring the sample. This outfit will make about 100 tests.[2]



[1] Van Norman recommends the use of 50th normal solution for testing cream. 37 cc. of a normal soda solution is diluted to 1850 cc. in a two-quart bottle, such as is used for mineral waters. Each cc. of this solution represents .01 cc. of acidity when 17.6 cc. of cream is measured off. The titration is made in the usual manner, using phenolphtalein as an indicator.

[2] Devarda's acidimeter is based on the same principle as Manns' test, one-tenth soda solution is added to 100 cc. of milk in a glass-stoppered graduated flask, 2 cc. of a 4 per cent phenolphtalein solution being used as an indicator. The graduations on the neck of the flask give the "degrees acidity" directly.

CORRECTION.

Through an uncorrected slip of the typewriter in the April issue of The Ice Cream Review, we unconsciously interfered with the rights of suffrage of the members of the Wisconsin Association of Ice Cream Manufacturers by stating that C. A. Carver was President and Charles Touton was Secretary. As it happens, just the reverse is true; Mr. Touton wields the presidential gavel and Mr. Carver is Ye Worthy Scribe. We're sorry it happened, and hope that all who received a wrong impression will hereby have it corrected.

It is not all of life to live—it is not all of farming to dig.—Hoard.

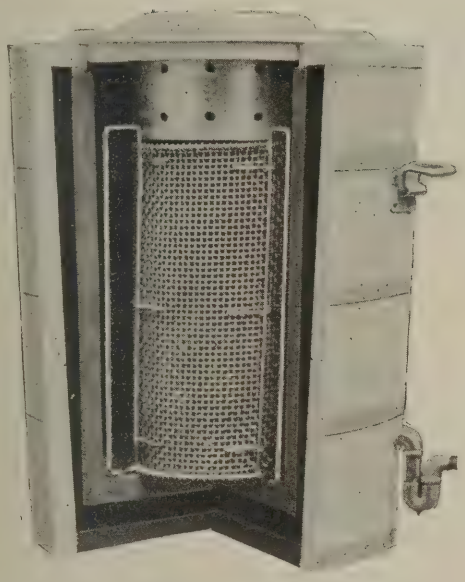
A THRIVING SMALL PLANT.

It isn't always size that counts for efficiency and production, even in the ice cream business, proving that there's some truth in the maxim about good things coming in little packages, P. N. Miller, Secretary of the Dixie Flyers, tells about a particularly interesting "small package" he has discovered in the ice cream industry in Bessemer, Alabama, in a letter to The Ice Cream Review, which follows:

To the Editor of The Ice Cream Review:

Under separate cover I am sending you a picture of one of the neatest small ice cream plants in this part of



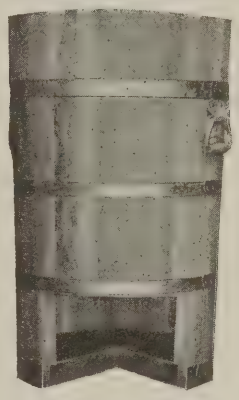
the South. It is located in Bessemer, Ala., but a few miles from the wonderful City of Birmingham, and is owned and operated by Schilleci Bros.

These boys have been in the ice cream business about four years, and have built up a very interesting business. They are men the travelling men love to call on, as they always have time to give their attention to what the travelling man has to offer.

The plant was installed by The Standard Milk Machinery Co., of Louisville, Ky. The York Refrigeration Co. installed two twelve ton compressors. There are two fine hardening rooms, and three Emery Thompson ice cream freezers.

The "Ice Cream with the Chocolate Kimona" received its portion of consideration when they built. A

The Thermos Ice Cream Cabinets



Patent Pending.

Built like a Thermos Bottle — Works on the Same Principle

The simple fact that other manufacturers are imitating our Thermo Idea of insulation proves it to be not an experiment but an assured success.

Made in 3 and 5 gallon size in singles and in 5 gallon sizes in double, tripple and quadruple compartments.

Cut showing one of our Regulars with section cut out. Note heavy construction.

The heavy Tinned wire can container in the fives are for convenience to user as well as separating ice and can chamber, thus making cabinet sanitary. Empty cans may be removed without disturbing packed ice chamber.

HANCOCK, - MICH.

room with proper cooling facilities for handling the Pie was installed, which in this part of the country is very essential.

The writer returned from his trip to the Pacific Coast in time to attend the opening of this plant, and on that day several thousand people visited the plant, wishing the Schilleci Bros. everything that was good. Judging from the past there is no reason why they should not be very successful.

Personally, I wish them much success, and I know this same wish is extended to them by every travelling man who has come in personal contact with them, also the house which said travelling man may represent.

With kindest regards to The Ice Cream Review, I am,

Sincerely yours,

P. N. MILLER, JR.

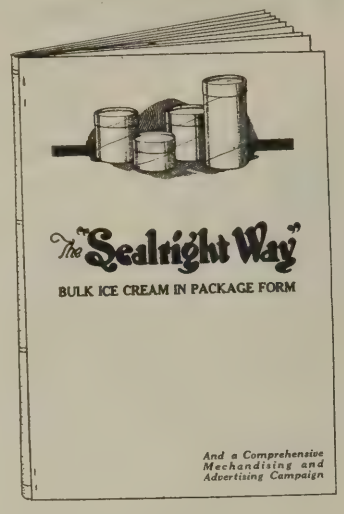
IMPORT DUTIES ON SALT.

The Louisiana Association of Ice Cream Manufacturers have informed their members that the pending tariff bill, as reported by the Finance Committee of the Senate, levies an import duty on salt as follows:

If in bags or barrels, 20c per 100 lbs., which is equal to $4.00 per ton; in bulk, 16c per 100 lbs., which is equal to $3.00 per ton.

If the bill is passed with this duty, it means an advanced cost of salt to ice cream manufacturers of $3.00 to $4.00 per ton over the present prices, according to statement issued by Chas. W. Priddy & Company, Inc., of Norfolk, Virginia.

The Louisiana Association suggest that members call this matter to the attention of their Congressmen and Senators, asking for a reduction in this duty, or rather, for the salt to be put on the free list, where it is at the present time.



FREE FOR THE ASKING.

The Elyria Enameled Products Co., of Elyria, Ohio, has just issued a folder describing the construction and advantages of their latest development in storage equipment. The booklet is very well arranged and is free for the asking.

The blessed spirit we enshrine and call a cow teaches us better. She tells us that from the laboratory of her body there comes the delicate fluid we call milk; from it we make cheese, and from out of this elaboration we make fortunes. The wilderness is made to blossom; we stand side by side with life, not with death.—Hoard.

THE SEALRIGHT PORTFOLIO.

Herewith is a reproduction of a portfolio recently issued by the Sealright Co., Inc., giving details of a comprehensive merchandising and advertising campaign explaining to users of Sealright packages how to get best results.

Efforts to educate consumers to take home bulk ice cream must be directed right in order to build up the highest possible sales. The portfolio shows how to go about it and the proposition is divided into three main divisions (1) to show the manufacturer how the "Sealright Way" must be handled in his own plant; (2) how it must be presented to his retailers and how they in turn must "carry" it on; (3) how to present the merits of the "Sealright Way" to consumers—reaching the consumer through advertising, both by the manufacturer himself and through dealer co-operation. The portfolio is a beautifully arranged booklet, 12x18 inches in size, and the advertising plan covers everything in detail. Ice cream manufacturers already report their entire approval of the practical suggestions offered.

THE DAIRY WORLD.

"The Dairy World" is the name of a new publication which will bid for favor in the dairy manufacturing field beginning with June 1st. Mr. Roscoe C. Chase, formerly advertising manager of the Davis-Watkins Dairymen's Mfg. Co., will father the new publication and, according to his announcement, "it will deal with advertising selling, purchasing, distribution, accounting, organization and National and International Progress."

Mr. Chase's new publication will be unique among dairy trade publications. It will be pocket size, 4½x6 inches, and distinctive in general make-up and subject matter. We welcome The Dairy World and wish it and its publisher a liberal measure of success.

Wrapped up in the animal we call a cow are the darkest mysteries of animal life.—Hoard.

What Part Does Your Package Play in Advertising Your Ice Cream

By T. S. MACONKEY, of the Burdick-Garrison Co., Inc., N, Y., Advertising Specialists to the Ice Cream Manufacturer

THE value of advertising, as a means of promoting the sale of ice cream, cannot be estimated. The true significance of advertising itself may never be reduced to a comprehensible definiteness.

. . Progress is marked by stations left behind. . . In the days of yesteryear the manufacturer contented himself with individual salesmanship;—he made most of his sales by word of mouth.

But today an ever increasing volume of business, and the stress of keen competition, have proved to him the value of keeping his trade name and product before the

public. So he turns to Advertising. Advertising becomes his medium for selling to the masses: advertising is group selling.

The printed word has this significance over an oral sale; it has a definite value; its meaning cannot be changed or influenced by a mood of thought or a state of mind. It becomes a permanent record which makes for consistency; which makes for a sincerity of purpose.

Advertising keeps a trade name, slogan and product in the mind's eye of the public. . . A quality product, plus constructive advertising, builds, for the manufacturer and his article, a reputation. And the manufacturer's reputation is now recognized as his guarantee to the consumer that he will always maintain his product at the highest standard of quality. Thus, he inspires the confidence of the public and establishes prestige.

But now to advertise ice cream in package form. . Whenever ice cream is sold in package form it is usually packed in a box, a cylinder-like container, or a carton bearing the special design or trade mark of the individual manufacturer.

The first object of your package should be to establish an individuality for your product; hence the importance of striving for a difference in the appearance of your package as compared with that of your competitor. . . Too many ice cream manufacturers are willing that their package shall resemble those already in use. They make them different only where necessary to avoid the possibility of the consumer not being able to identify their product. Avoid prosaicism; individualize your package. If your package is somewhat similar to your competitor's you destroy the impression of the individuality of your product.

The second object of your package is that it should serve as a continual reminder of the existence of your ice cream. . . Make it easy for the public to remember your product. Give careful consideration to your trade name and slogan. A distinctive style of lettering should characterize your logotype, and its uniformity should be adhered to, at all times, in all of your advertising.

Be consistent in your policy and don't allow the public to lose sight of your trade name or slogan, not even for the shortest interval of time. If you do the effect will be injurious; the public has a short memory. And never forget to remember that, "Keeping everlastingly at it brings success."

LEWISTOWN PURE MILK COMPANY PURCHASES ICE CREAM PLANT.

The plant and all equipment formerly owned by the Mount Union Ice Cream Company of Lewistown, Pa., have been purchased by the Lewistown Pure Milk Company, who are remodeling the building and making extensive improvements. The plant will be fully equipped for the manufacture if ice cream and the distribution of market milk. An ice plant with a capacity of three tons daily will be part of the equipment.

TRY THIS PACKER AT OUR EXPENSE

The Glacifer

A Dry Container for Preserving and Shipping Ice Cream.

You can save your customer from 5c to 10c per gallon with no cost to yourself.

You yourself can save from 5c to 10c per gallon on every gallon you ship.

You can extend your shipping business—reach people you have never reached before—get back some of the business you lost on account of high express rates.

Our circular tells all about this Packer—Write for it.

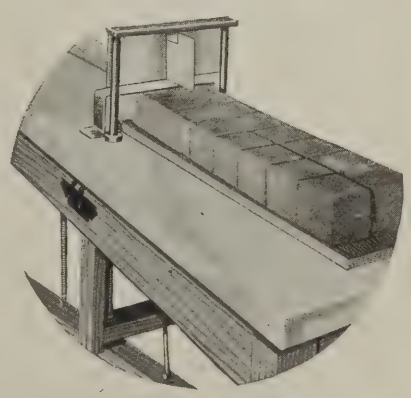
T O.
102 Mass.

No Strings to This Offer

We will send a 20-quart Glacifier for bulk cream on 30 days trial. At the end of that time, pay for it if you like it, otherwise return it.

Price for single Glacifer, $12.00; in lots of 25 or more, $10.00.

Try one **now** in your own plant, under your own conditions, at our expense.



ce Cream utter

Will cut any shape that can now be cut with the most expensive ice cream cutter. It will do it just as fast and with only a little practice.

It cuts Eskimo Pies uniformly and the quantity is only gauged by the speed of the operator.

Pints or Quarts require only the omission or insertion of the projecting knife shown in illustration to the right.

Non-rustable table of substantial construction.

Two Weeks Free Trial Offer

To any responsible ice cream manufacturer we will ship one of these cutters on two weeks free trial. Put it to any test. Make any comparison you desire. If not satisfactory all you have to do is to write for shipping instructions and we will pay freight both ways.

Illustrated circular sent on request.

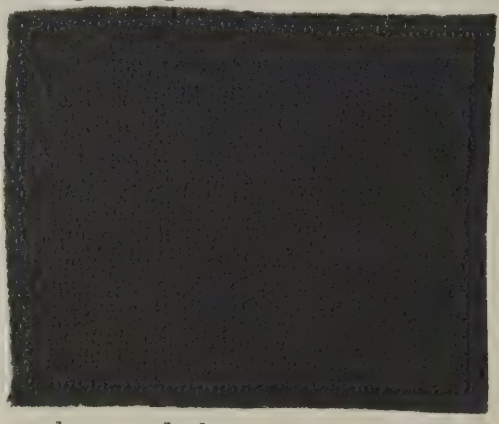
Fond du Lac Wisconsin

Hitch Your Carton to Your Advertisements



By F. B. WILLIAMS, Nordhem Syndicate Service

PEOPLE buy Old Dutch Cleanser because they instantly recognize on the can in the store the self-same Old Dutch lady that has been made so famous thru countless advertisements. It is the same way with Aunt Jemima Pancake Flour, Wrigley's Spearmint, 3-in-1 Oil, Bull Durham, and many others of the most outstandingly successful manufactured products—the package is the final link in the advertising campaign.

Ice cream manufacturers have for the most part overlooked the obvious selling lesson involved in this "hitching up" of the carton with the advertising. It is only lately, in fact, that the possibilities of the decorative or distinctive carton for ice cream have begun to be realized. But now that a few pioneers have replaced the old-time cheap paper box—labelled "Fine Ice Cream, 1 Qt.," or words to that effect—with artistically colored and designed boxes of paraffined cardboard, there will probably be a grand procession to get in on the decided selling advantage which the new type of container means.

A Fertile Field Cultivated.

The few steps which have been taken in this direction are only hints of what may happen when the manufacturers, artists, box-makers and advertising men get to working together to make the ice cream carton a real asset in retailing.

The possibilities for a definite appeal to the children, in particular, thru this medium are almost limitless. Take, for instance, the example of one commercial artist who—working in the interests of an ice cream manufacturer—conceived the idea of developing the containers into a series that would unfold a picture story to the kiddies who were fortunate enough to have this cream bought for them. The central figure in these box-dsigns was that of a little girl, with a catchy fictitious name, who served also as the trade-mark for all of the company's products. (There's that idea of the "hitch-up" bobbing up again.)

"Among Those Present"—the Ingredients.

In the picture-story which the carton told, the little girl of the trade-mark proceeded to give a party. And her guests marched across the sides of the box in fantastic procession—the demure peach, the hectic strawberry, the self-important chocolate bar, the perspiring cake of ice, that sour old chap—the lemon, the modest little vanilla bean—all gathered together to give pep and flavor to the occasion. What child wouldn't be thrilled to find all these important personages come to life,—and for the sole purpose of giving him the very best of ice cream?

Then the plan went on (always featuring the trade-marked figure of the little girl, who became the familiar playmate of all the children in the city) to portray each month a new adventure for the little girl and her fantastic companions.

Expense Justified by Results.

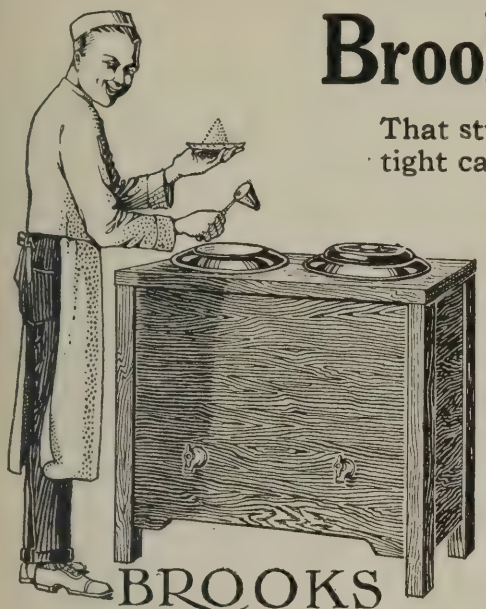
A great additional expense, you may say, to change the design of the carton every month or so. Really not at all great when you consider the amount of salesmaking interest developed thru a field hitherto untouched.

But a container of changing and timely interest without proportionate extra expense for special art work etc., is possible for the enterprising manufacturer who adopts another plan which occurs to the seeker after original advertising possibilities.

This second suggestion takes it for granted that the manufacturer is advertising his cream on outdoor poster-boards, on car-cards, or both. This is a safe assumption to make, inasmuch as nowadays there are few of the really big ice cream men who have not come to realize the value of these particular mediums for picturing their product in all its color and appetite appeal to the greatest number of prospective buyers.

Enter the Poster-Carton.

The idea is to make one or two sides of your box simply a miniature reproduction of the current month's poster and car-card. Inasmuch as the manufacturers are able to secure posters which represent the very highest type of art work, this means that customers will find in these novel and timely cartons an unusual artistic appeal.



There are scores of other possibilities that come to mind once this interesting question of making the ice cream box a selling asset is broached:—such as diagrams showing the children how the colored boxes can be used as blocks to make all sorts of things; or can be cut up as paper dolls; or how the folded boxes can be opened out and fastened together to make a big cardboard doll-house, etc. Doubtless there's no end to the suggestions a professional advertising man would have on such a fertile subject as this.

Hang on to This.

But the big idea—the all-important thing not to be forgotten, whether you change your design once a month or only once a century—is to connect up your carton with your other advertising material, so that the customer recognizes it as an old friend. Distinctive and attention-getting trade-marks are one of the hardest things in the world to create; but once you have one—a figure that is beyond a doubt **yours,** the public symbol of your ice cream and all that stands behind it—once you have this you have the biggest part of your advertising problem solved for all time.

Then all that is necessary is the reiteration of this trade-mark in public attention;—and using it on your carton is simply part of the logical sequence which makes it impossible for your brand to be confused with others in the buyer's mind.

Remember again the Bull Durham bull, the Old Dutch Cleanser sunbonnet lady, and the legion of trade-marked figures that are synonymous with individualized brands; remember the nation-wide reputation for quality chocolate candies which Whitman's Sampler has built up—simply by the advertising of a most unique and desirable box;—remember these things and you will grasp the significance of the distinctive carton in the selling of your ice cream, and of the consistent advertising which makes this distinctive carton "what the public wants."

Lifting the Burden in the Freezer Room

How the Simple Floor Truck Can be Used to Save Time, Labor and Hard Knocks

COMPETITION is becoming so keen among ice cream manufacturers that every possible device that can possibly cut down costs or expedite production is being considered. The keener the competition, the farther this searching for the small leaks in the business goes, and many things ordinarily unthought of or unnoticed are turned up. Some of these losses, however, turn out to be quite large instead of small.

One loss of this type often occurs in the handling of supplies and finished product in the plant. The job was done that way years ago and it keeps right on being done that way. Nobody realizes that it ought to be changed because it looks like only a very small and unimportant detail. Good modern floor trucks will save a lot of time, energy and space in the handling of supplies and ice cream inside the plant.

Trucks are usually made in two, four and six wheeled types, both balance and non-tilting style. The balance type is so named because the trucks balance from the center wheels and the caster wheels at the ends are slightly off the floor. Sueh a truck can be pushed from either end and will turn around in its own length and can be handled very efficiently in narrow aisles and around square corners. They are far preferable for crowded aisles and crowded factories. The non-tilting type has two casters at one end of the truck and two main wheels near the other end, and can only be pushed from the caster end. This type of truck takes a little larger space to turn around in, and is not quite so easily handled as the balance type, but is preferable for use on inclines. Naturally, these platform trucks can be used for handling any article in the creamery from cartons of butter to loaded milk cans or ice cream cans, as well as tubs of butter and any other package article. In the handling of ice cream, either the balance type or the non-tliting type can be used. The illustration of the balance type truck, showing fifteen loaded five gallon cans, gives a good idea of this.

Balance Type of Truck.

Commencing from the time in which the ice cream cans are sterilized, we see them put on the ice cream can and cover truck, with the covers thrown onto the enclosure at the top of the truck. This keeps the cans and covers together at all times and allows them to drain. The cans and covers are kept on this truck, pushed into a corner or any other place that may be desired, and left there until needed in the freezer room.

Can and Cover Truck.

The trucks loaded are then run into the freezer room and the cans taken off at the freezers as desired. This truck acts as a movable rack for storing the cans as well as a truck. As soon as the cans are filled with ice cream, the value of the platform type of truck is seen, because fifteen to twenty-four of these cans can be put on the truck as soon as they are filled. The truck can be run into the hardening or storage room, no matter how far it is from the freezers, and kept there until such a time as a load is wanted at the delivery wagon. The truck, still loaded, is then run out to the delivery platform and the cans transferred in the wagon.

It is evident that a great deal of time is saved in handling by this method as it saves at least two handlings of the ice cream cans empty and at least three to four rehandlings of the filled cans. This saving in labor pays for the investment of the trucks in a very short time. Many plants have found, upon keeping actual figures of these things, that they should consider floor trucks more of an investment than an enpense. The Crescent Creamery Company, who have one of the most modern plants located in St. Paul, Minnesota, are using this method and find it works very profitably indeed.

BRISTOL VIRGINIA

A Valuable Impression

A pleasing impression upon customers is of value. You can create one and at the same time save your goods from damage by spreading sheets of **TANGLEFOOT** in your show windows, especially over Sunday.

TANGLEFOOT will then be at work for you and will not only catch the flies, but attract the attention of people who pass your store to your efforts to keep your stock clean and fresh, and create in them a desire to use **TANGLEFOOT** themselves. This means extra sales to you. For 1922 **TANGLEFOOT** has been reduced 60 cents per case. This will allow you to sell at the old price, two double sheets for 5 cents, and make a profit of 50 per cent.

Remember **TANGLEFOOT** *catches the germ as well as the fly, and that poisons, traps or powders cannot do it.*

"SLIGHT NOT WHAT'S NEAR THROUGH AIMING AT THE FAR."—EURIPIDES.

trucks are valuable in allowing the butter to be piled on them the minute it is packaged and if it is kept in the storage or refrigerator room for any length of time, the material can be left right on the trucks without any handling, because the truck will take up no more room than a shelf would take, holding an equal amount of butter. These trucks can be made with three or four shelves to hold loads anywhere from 750 pounds to 6,000 pounds, which is more than would ordinarily be put on any shelves. The butter is kept on these trucks until shipping time arrives and delivered direct to the packing room or shipping room for crating or delivery direct to the wagon, or trucks.

We are indebted to the Nutting Truck Company, Faribault, Minn., for the cuts. This firm has been in the floor truck business for over thirty years and maintain a department especially for trucks for the dairy industry. Their product has received commendation from ice cream manufacturers, milk dealers, and creamerymen everywhere for its money-saving qualities. A photograph of their Faribault plant is shown.

NEW CONE FACTORY FOR CHICAGO.

The Cone Company of America, head office and plant Long Island City, N. Y., manufacturers of Havacone pure cake ice cream cone have recently taken a large portion of the Central Bag Manufacturing Company's plant located at 6001-6033 So. Western Avenue, Chicago, Ill., where they will manufacture Havacone for their mid-west trade. This plant is a modern sanitary building of the very latest design and suitable in every way for the production of a pure food product.

The men identified with the Cone Company of America have been associated with the manufacture of some of this country's outstanding successes in pure food products for many years and have a reputation to maintain, hence the success of the new enterprise is practically assured.

NEW ICE CREAM PLANT IN HOUSTON.

The Co-operative Dairy Products Company, Houston, Texas, recently purchased the business of the Houston Co-operative Dairy Association. This firm will remodel and equip the plant for the manufacture of butter and ice cream, and will erect an ice and cold storage plant to be devoted entirely to butter and eggs.

The officers of the company are: T. J. McCabe, president; W. P. Magill, vice-president; J. E. Wilson, secretary-treasurer.

This company will get most of its milk from its own herd.

FIRE CONSUMES PART OF CABINET PLANT.

On the 25th of April fire destroyed a part of the plant of the Archie J. Verville Co., Hancock, Michigan. According to report received from Mr. Verville, the fire has put the plant out of commission for a short time but expects to again begin operation on the 15th of May.

They are building the thermos bottle type of ice cream cabinet.

CHANGE OF ADDRESS.

The Russell Stover Co., recently changed its Chicago headquarters from the Mallers bldg. to the Kesner bldg. The company's address is now 5 N. Wabash Avenue, Chicago, Ill.

THROUGH THE MILL IN PENNSYLVANIA.

The Bureau of Foods of the Pennsylvania Department of Agriculture has given a clean bill of health to the chocolate coated ice cream bars sold in Pennsylvania. Since March 10, agents of the Bureau have collected 90 samples sold in thirty cities and towns of the State.

Director Foust's O. K.

These samples were submitted to the six chemists of the Bureau for analyses. Director James Foust of the Bureau announced that the reports of the chemists showed that each of the ninety samples was entirely free of paraffine, cocoanut fat or adulteration of any kind.

Early in the year it was reported that a few dealers were substituting paraffine in the coating of the ice cream bars. A crusade instituted by the Bureau of Foods has resulted in the industry aurning out a first class product.

The annual report of the Bureau of Foods, Pennsylvania Department of Agriculture, submitted by Director James Foust to Secretary of Agriculture Fred Rasmussen, shows the vast amount of work that was required to protect the people of Pennsylvania in 1921 from the dangers of impure foods and beverages.

The report also shows the growth of the Bureau since 1907 when Director Foust assumed charge. One of the features of the report is the fact that a decrease in expenditures in the operation of the Department in 1921 over 1920. is shown.

In 1920 the Bureau expended $102,284.45, while last year the expenditures were reduced to $91,894.73. The report indicates another unusual fact—that each year since the inception of the Bureau of Foods, the number of analyses of the food and drinks of the State have been practically the same. Thus in 1907 there were 7,400 samples analyzed by the Bureau chemists, while last year there were 7,422 samples collected and analyzed.

Last year there were 1,031 cases terminated by agents of the Department, a decrease of just two cases over the number terminated during the previous year. The receipts of the Bureau also fell off somewhat last year, due largely to the fact that a number of firms handling oleamargarine went out of business. The receipts in 1921 were $596,524.01, while during the previous year the receipts amounted to $626,472.25, the largest amount in the history of the Bureau.

In the fifteen years covered by the report, the Bureau of Foods has collected and analyzed 106,656 samples while during the same period the agents have terminated 14,172 cases in the courts of the State and during this time the Bureau received $4,173,441.52 in receipts. The cost of operation of the Bureau during this period was $1,234,467.01.

During the first two years of Mr. Foust's administration the Bureau was not self sustaining; now the receipts are more than three times the amount of the expenditures. The receipts are deposited with the State Treasurer for the use of the Commonwealth and the expenditures are provided for by appropriation.

NEW MILK PRODUCTS COMPANY ORGANIZED IN WELLAND, ONTARIO.

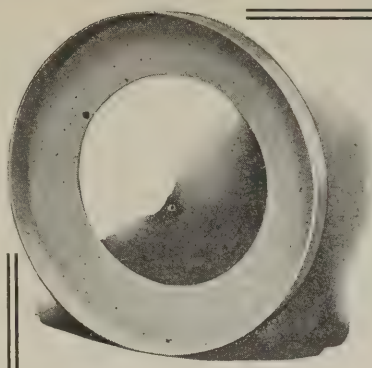
The Martin Milk Products Company, Limited, a $200,000 corporation recently organized at Welland, Ontario, is a business of interest and importance in that part of the country. This company will manufacture a fine quality of bulk and brick ice cream, as well as butter, cream cheese, pasteurized milk, and other products along the dairy line. The Niagara Peninsula can now supply these products to its citizens first hand, instead of being obliged to import such foods from far-away points.

The chief promoters of the company are Martin Brothers, who are pioneers in the pasteurized milk business in Welland, and the reputation of their products, which are acknowledged to be among the finest put up in Canada, speaks well for the products to be turned out by the new firm; it is, practically a guarantee that the goods produced will be of the best quality, thus assuring a success from the start.

The new firm has purchased the plant of the Goodwillie Canning and Preserving Company, and are installing the best up-to-date machinery and cold storage equipment that can be bought. The plant will be a model of sanitation and cleanliness, and if it is possible to make any estimate from the number of ice cream orders now coming in, it will be taxed to its utmost capacity right from the start.

The management of the firm and its directors are as follows: E. L. Martin, dairyman, Welland, president and general manager; J. D. Martin, dairyman, Welland, vice-president. Directors J. E. Martin, dairyman, Welland; Thos. C. Bald, farmer, Thorold township; H. D. Rice, farmer, Thorold township. A. A. Marshall, accountant, Welland, secretary-treasurer.

⚜



NEW HOME FOR "PRIDE O' UTICA" ICE CREAM.

The Pride O' Utica Ice Cream Company has leased a large two-story building for a new plant. The building will be repainted and remodeled throughout immediately, and when the work is completed the company will have one of the finest, most modernly equipped ice cream plants in New York State.

Since starting in business about three years ago, the Pride O' Utica Ice Cream Company, by making an excellent ice cream, and by rendering to its dealers and consumers a service of the most sterling character, has made unusually rapid progress and the need for a better and larger factory to care for its ever increasing business has been keenly felt for some months past. The building they are about to occupy is ideally located, has superb shipping facilities and with adequate floor space the company will have no difficulty in filling their requirements for some time to come.

This firm will spare no effort or expense in making its new home a model ice cream plant. It will be a commodious, well lighted, well ventilated, clean factory embodying every conceivable sanitary feature and every convenience. The latest, most improved machinery for manufacturing and packing ice cream will be installed, which will make it possible for the company to, not only manufacture a still better quality ice cream, but to increase its production.

The Pride O' Utica Ice Cream Company is to be congratulated on their progressiveness. Their success is the result of their ability to manufacture an ice cream that never fails to meet with the approval of discriminating people plus a desire to make friends of their customers by giving at all times prompt, pleasing, courteous service.

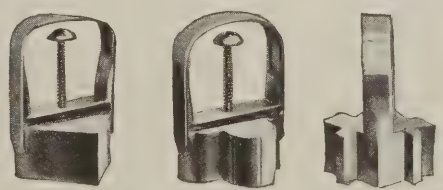
B. L. R. Re-inforcing Tub Bottom Hoops

"Makes Tub Bottoms Last As Long As The Sides"

The weakest part of all tubs (the groove or chime) has always been a source of trouble and responsible for the expenditure of thousands of dollars.

The usual method of repairing tubs by cutting them down, soon renders the tub useless. Three cuttings usually finish the tub.

B. L. R. REINFORCING HOOPS, eliminate all temporary repairs and expense and make the bottoms of ice cream tubs last as long as the sides.



SIZES.

B. L. R. Hoops are furnished in the following sizes: 14½", 14¾", 15", 15¼", 15½", 15¾", 16", 16¼", 16½", 16¾", 17", 17¼", 17½", 17¾", 18", 18¼", 18½".

DETROIT **CLEVELAND**

IT IS EASIER TO GIVE ADVICE THAN TO LEND A HAND.

PACKERS, OR ICE CREAM TUBS.

(Continued from page 80)

Question 14—What is the average life of a tub in your business?

The life of the tub is of course affected by the service required from it. However, average figures show that the life of a good tub with reasanable care is five years. Some few manufacturers find that they last twice as long or longer, but these cases are quite exceptional. The grade of tub used also makes a difference. The Wisconsin manufacturer mentioned in question 12 reports that his tubs last 8 to 10 years.

* * *

Ice Cream Cabinets.

Question 1—Do you loan cabinets or require retailers to buy them?

Of 131 manufacturers who answered this question, 98 loaned the cabinets, 9 required the retailers to buy them, and 24 did not handle cabinets at all, which, of course, made it necessary for dealers to get them elsewhere.

Although most of the manufacturers loan the cabinets to dealers, the majority of them feel that this is a bad practice, and do it only because competition makes it necessary. One man says, "I think there should be a law passed prohibiting ice cream factories from furnishing cabinets. This is a big expense for the manufacturer, and dealers do not take proper care of them." Another says, "Such a practice should not exist, but after it is started it is hard to stop. If the retailers can't get cabinets from me they do from someone else, and I lose a customer."

Since in the long run the dealer in most cases has to pay indirectly for the cabinet anyway, it would seem that it would not be such a great hardship to require him to furnish his own. However, due to competition, it is very difficult for manufacturers to abandon this practice unless it is generally agreed upon.

A few manufacturers sell the cabinets to dealers at cost, either cash or on weekly or monthly payments. Some loan them locally and sell to outside dealers. A few manufacturers require dealers to sign contracts for the loan of the cabinet in which they agree to pay certain stipulated amounts in case less than the required gallonage is sold. These contracts permit the manufacturer to remove the cabinet at any time conditions make it advisable.

Question 2—If you loan cabinets, do you keep them out the year round?

Practically all manufacturers who answered this question kept the cabinets out all year when the dealer did a year-round busines in ice cream. If the customer handled ice cream in the summer only, the cabinets were brought in at the end of tthe season. This was done without exception in the case of resorts and beaches. In some cases where the dealers were known to be reliable they were allowed to keep the cabinets all year provided the condition of the box was satisfactory to them.

In large cities where in most instances the cabinets were in use constantly the manufacturers endeavored to get the cabinets in once a year at least for painting and repairing, in which cases an exchange was made.

Question 3—Do you furnish larger capacity cabinets in summer and smaller in Winter?

Of 110 manufacturers who answered this question, 38 furnished smaller cabinets in winter and 82 did not. A great many who did not make a change in the case of a two or more compartment cabinet, furnished icing service for a reduced number of compartments in winter. In the big cities customers using large quantities of cream used more than one cabinet in summer, and in fall those not needed were taken back.

Question 4—What terms of rental?

In only a very few cases was rental charged for cabinets, and in some of those instances it was charged only when the dealer did not sell the amount of ice cream stipulated in the contract. One manufacturer said that the suggestion of rental would be met with violent protest and probably loss of customers.

An eastern manufacturer who rents cabinets to dealers who sell other brands of ice cream than his own charges at the rate of 25c for a 5-gallon cabinet, 30c for a double 5-gallon size, and 35c for a three compartment 5-gallon size. Other rentals are on a monthly basis ranging from $1 to $2.

Question 5—What size cabinets are most generally used in your community?

The most popular size cabinet, regardless of the size of the city or town, is the two-compartment 5-gallon size. In large cities where a great deal of ice cream was used two of these cabinets were furnished in preference to one of larger size. In some instances where two of these cabinets were furnished, one compartment of one of the cabinets was for brick.

Other popular sizes were the three-compartment 5-gallon cabinets with one compartment for brick and two and three compartment three-gallon size. A great many single compartment 5-gallon cabinets were also in use, particularly at small places which did a cone and dish business.

The 5-gallon cabinets, single, double or triple compartments, sometimes in combination with a compartment for brick, were by far in the greatest demand.

Question 6—Do you charge for icing?

One hundred and twenty-four manufacturers answered this question. Of these, 45 did not give icing service, 28 gave this service and charged for it and 51 gave it without charge.

Of those who gave icing service without making an extra charge, quite a number stated that payment for this service was accounted for in the price of the ice cream. A few manufacturers gave the service without charge when the ice cream used was in excess of a certain number of gallons, and when it was less than this amount a small charge was made.

In the number of those who do not give icing service are included those who pack the cream in ice only for delivery, and do not give packing service beyond this.

One manufacturer who includes the charge for icing in the price of his ice cream makes an allowance of 5 to 10c a gallon when the customer furnishes the ice himself.

One manufacturer speaks his mind very emphatically on the subject of giving free icing service. "The manufacturer who does that," he says, "should pay the dealer's rent and furnish at least one clerk."

Here, as in question 1, it seems that the manufacturer gives this service free because he is forced to by competition. Because of his facilities for chopping and delivering the ice he can do so very satisfactorily, and it would not seem that the customer should object to the small charge it would be necessary to make to cover the cost of this service. However, in localities where competition is keen, it may be readily seen that it would be impractical for one manufacturer to eliminate this free service unless the others did also.

Question 7—If so, on what basis?

Most manufacturers base their charges for icing on he number of gallons of ice cream purchased, averaging 0c a gallon. Others base their charges on the amount f ice that is used in excess of what is necessary for acking in delivery. The amount ranges from 10c a ucket to 40c a hundred pounds. Some charge a flat eekly rate for this service averaging $1.

Question 8—How often do you overhaul and paint cabinets?

With only a few exceptions, all manufacturers answering this question overhauled and repainted their abinets each year. Some found it necessary oftener, nd others not so often, but, judging from the number vho made it an annual practice, this seems to be adisable and profitable.

Question 9—What is the average life of a cabinet?

Answers to this question showed quite a diversity, anging in time from 2 to 15 years. The general average or an all wood cabinet of a good grade which is given easonable care is 5 years. The life of a cabinet depends o a great extent upon the care given it by the customer, nd an inferior cabinet which is well cared for may last lmost as long as a good cabinet which is given careless reatment. However, cases of extreme carelessness on he part of the customer are the exception rather than he rule, therefore most manufacturers find that it pays o get a good cabinet.

Manufacturers using metal lined cabinets find that t is necessary to reline them once every second season, r oftener. One manufacturer states that a 22 gauge alvanized iron lining will last in the average cabinet bout four years if painted each winter.

* * *

Containers.

Question 1—What percentage of your gallonage is sold in bulk?

Of 133 manufacturers who answered this question, eplies were received as follows: 5 sold 98 per cent in ulk; 20 sold 95 per cent in bulk; 39 sold 90 per cent; sold 85 per cent; 25 sold 80 per cent; 16 sold 75 per ent; 10 sold 70 per cent; 2 each sold 65, 60 and 79 per ent; 1 each sold 100, 99, 96, 92, 89, 78 and 50 per cent.

Question 2—What percentage in brick?

One hundred and twenty-three manufacturers gave eplies to this question. Of these, 24 sold 5% in brick; 30 old 10 per cent in brick; 8 sold 15 per cent; 24 sold 20 er cent; 9 sold 25 per cent; 6 sold 30 per cent; 1 sold 5 per cent; 2 sold 40 per cent; 5 sold 2 per cent; 4 sold per cent; 3 sold 7 per cent; 2 sold 4 per cent; 1 each old 8, 11 and 21 per cent, and 1 sold none in brick.

Question 3—What percentage in other containers?

Only 40 manufacturers sold ice cream in other containers. Of these, 14 sold 5 per cent in this manner, 8 old 10 per cent, 3 sold 15 per cent, and the others sold arious percentages ranging from 50 to 1 per cent. hese figures can give only an approximate idea of what ercentage is sold in special containers, for quite a few anufacturers included their chocolate coated ice cream ar sales in this percentage. The average for ice cream old in special molds and other containers, as far as we re able to estimate averages 3 per cent.

Question 4—Do you use a packaging machine?

One hundred and seventeen manufacturers replied to his question. Of these 6 used a packaging machine and he rest did not. One manufacturer who did not use a

The "STAY-ON" is made right by men who know how, and have studied the requirements of the Ice Cream manufacturer and shipper.

Thats why the "Stay-On" today is the biggest seller, and enjoys the widest distribution.

"Save the Bottom and you Save All"

When the bottom hoop goes and the staves begin to spread, the particular tub in this condition is "on its last legs." Another trip and only an empty shell remains.

Use The Frick Bottom Hoop

and your tubs will start life all over again.

With this hoop you can replace bottoms that are out, or repair weak bottoms. Making them stronger than when new. In either case, your tubs if equipped with Frick Hoops will last two or three times longer than a new tub of the present type.

This is not a cheap repair job but a permanent improvement. We use heavy rust-resisting metal and hot galvanized after hoop is made complete.

Note: Our hoops are riveted to the staves far enough up in the wood to make them absolutely secure.

Write us today for further details and prices.

Frick Hoop Company

Corsicana, Texas

machine filled the Sealright containers directly from the freezer, which process seems to be satisfactory in his case.

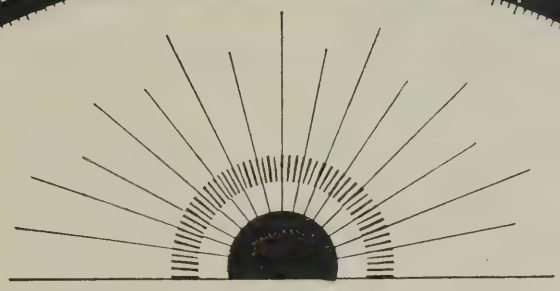
Question 5—If so, is it satisfactory?

Very few manufacturers had had these machines in use long enough to consider that they had been given a fair trial, but none of them expressed dissatisfaction. One man said that the machine was O. K., but it remained to be proved whether or not the sale of the package would be a success. A southern manufacturer had had such excellent success with the packaging and sale of one color cream in containers that he is going to put two flavors in a carton.

Those manufacturers with whom the use of a packaging machine was in the experimental stage were unanimous in stating that they were certain it would be successful.

Question 6—What special effort have you made to encourage the consumer to "Take home a package of ice cream?"

The methods of publicity to encourage the sale of package goods were for the most part the use of general newspaper advertising, window strips and billboards. A few manufacturers most of them in smaller towns and cities, used movie slides to push these sales. Week-end specials were strongly advertised by quite a number of manufacturers with good results.



Altogether too great a number of manufacturers made no effort of any kind to encourage the sale of ice cream to home trade. It seems that the field of developing the habot of home consumption of ice cream offers sufficiently rich possibilities to the average manufacturer to make it well worth his while to cultivate it.

One manufacturer sums up the situation thus: "Make a quality product, sell it at as low a price as you can, let the public know about it, and in time your efforts will bring profitable results."

Question 7. Is the growing tendency to put ice cream in cartons and sanitary containers building up a greater gallonage in your community?

The majority of manufacturers who replied to this question found that this situation did increase their total gallonage, though most of them stated that it had not as yet been given a fair trial. One Indiana manufacturer stated that he noticed a marked increase each year, and had reasons to think this year would surpass all previous records. A few manufacurers said that in the absense of mechanical refrigeration they did not push the sale of package goods, because it was more difficult to pack than bulk.

Most retailers prefer the sale of bulk ice cream because they think it allows them a greater margin of profit, hence they are not pushing the sale of packaged ice cream. One manufacturer who found this to be the case filled the cartons and sold them to the retail trade directly from the factory. The result was that many of the customers passed up the retailer and came to the factory for their cream. This indicates that the sanitary features of packaged ice cream are appreciated by the general public, and if these features are brought to their notice they prefer to buy it this way. In this connection one Illinois manufacturer says, "We feel that the ice cream manufacturer must educate the consumer to buy packages put up by the manufacturer. Ice cream put up in a sanitary package at the factory reaches the consumer in better shape than when dished up by the merchant." If such a plan would be carried

10c

out, it is reasonable to expect that the result would be a generally increased gallonage the year round.

Question 8.—If you pack a special container ready for the customer to carry home, do you experience any trouble in getting the retailer to properly care for it?

Altogether too many manufacturers have difficulties in this respect. One manufacturer had so much trouble that he discontinued packing in such containers. His was the only instance where such an extreme situation prevailed, however. In many cases the trouble was confined to careless dealers.

Some manufacturers feel that if they provide a cabinet and keep it iced their responsibility ends there, and it is not their fault if it is not in a good condition when it reaches the consumer. We feel that in the case of packaged goods it is more important that it should reach the consumer in a good condition than in the case of bulk, for in most instances the manufacturer's name appears on the package, and it would react to his disadvantage to have it delivered to the customer in any but a good condition.

A few manufacurers overcome this difficulty by delivering directly to the consumer. It is difficult to see how this can be made profitable unless engaged in on a big scale, and with proper facilities.

It would not seem that keeping the packaged cream in good condition would offer such difficulties to the average dealer that he coud not overcome them with a little extra care. Many dealers have found that they were well repaid for such effort.

Question 9—Is such a container building a satisfactory trade for you?

With only eight exceptions, manufacturers who answered this question found that it did build a satisfactory trade for them. The main reason why it did not was that it was not pushed hard enough.

One manufacturer says in his reply, "We believe that the consuming public like the non-returnable packages, as they are certain that the package has not been used previously for ice cream or anything else."

The use of a special container which will keep ice cream several hours without ice was found to be satisfactory by several manufacturers who sold directly from the plant, but no retailers were found to handle them.

Question 10—Which business do you prefer, bulk or package?

Of 128 manufacturers who replied to this question, 96 preferred bulk business and 32 preferred package.

Question 11.—Why?

The main reasons given for preferring bulk were that it was less trouble, easier to handle, required less ice per gallon for freezing and packing, was kept in better condition by the retailer, and was more profitable. Bulk ice cream was preferred almose unanimously for shipping trade.

A Pennsylvania manufacturer says that he prefers bulk because package goods requires more attention to keep it in good condition, and is likely to lose it flavor or absorb other flavors.

Another manufacturer said that he preferred bulk, although the sale of brick kept up the winter trade, because it required a great deal of effort to satisfy the public taste in the matter of flavors, as they were constantly expecting something new. Practically all small town manufacturers preferred bulk, because there was little demand for brick and it was hard to keep.

There were a number of what appear to be excellent reasons for preferring brick or package trade. The main reasons were that it was more sanitary, easier for the retailer to handle, and eliminated the expense of supplying tubs. A few manufacturers also found it was more profitable, and quite a number of them expressed the opinion that they believed it would continue to gain in popularity as the public became educated to its advantages. The possibilities of advertising also came it for considerable mention.

A prominent Wisconsin manufacturer says, "Brick is the best from an adevrtising standpoint because our name goes into the house on the carton." An Arizonia manufacturer who prefers package trade seems to have difficulties of an unusual nature in developing this trade, for he says, "We are having our hands full trying to educate our trade to package goods. The inhabitants of this country are about 40% Mexicans who prefer bulk, and the redder the better. Consequently we have a large sale of strawberry." The situaion is not typical, but interesting.

Question 12—Have you tried iceless containers for shiping?

Of 107 manufacturers who answered this question, 12 had tried the iceless containers for shipping.

Question 13—If so, with what success?

The main objection seems to be on the part of the dealer, for by use of this system he does not get ice for packing.

One Wisconsin manufacturer reports that these containers give excellent satisfaction where the dealer has a refrigerating plant. A Missouri manufacturer says that he could ship cram 1000 miles in the hottest weather without repacking by this mehod.

Question 14—Have you tried to increase your sales of package ice cream through grocery of chain stores?

Of 125 manufacturers who answered this question 31 had tried this method and 94 had not.

Question 15—If so, with what success?

The consensus of opinion here was that this business was satisfactory where these stores were located in the outlying residence district, and did not interfere with the business of the regular dealers. One manufacturer reported that all his last year's dealer's were back, and with them several others.

The main reasons for finding this business unsatisfactory were that the gallonage was not sufficient to make it pay, and that the dealer was usually not equipped for handling this business. Also,, in many cases these stores undersell the regular dealers, which causes dissatisfaction. In almost all instances it was found to be only a summer business.

Here as in other instances, the dealer who takes active steps to push the sale of ice cream as a general thing makes a succes of it. Pushing of course takes the form of advertising of some kind. In fact, it is safe to say that the sale of ice cream in general will increase in proportoin to the amount of intelligent, well directed advertising it receives, particularly in the direction of increasing home consumption of this commodity. It is assumed that this advertising will be backed up by quality and a fair price.

PACKAGING MACHINE PAYS.

The Corbett Ice Cream Company of Denver, Colorado, advise that thru the recent installation of the Mojonnier Bros. Co. ice cream packaging machine, they were enabled to turn out 13,000 pint bricks of different flavors. One of their dealers, the Scholtz Mutual Drug Company put on a special sale for one day selling pint bricks at 10 cents. They sold over 11,000 in one day.

Packaged Ice Cream and Service

YOUR first consideration of Service is the time element. Good telephone service is a call completed quickly. Good retail service is a transaction completed promptly.

Brick ice cream can be served much quicker than bulk ice cream. This item of time means much to the busy retailer, and it means much to the consumer. Most of us think we are in a hurry, whether we really are or not.

Packaged ice cream means more than the time element of service. It is clean, sanitary and is always exact measure. A few days ago four traveling men were eating lunch at a prominent hotel. The sugar was individually wrapped. In the sugar bowl were two cubes not wrapped. Not one of the four selected the unwrapped sugar. It didn't mean much except that all of them **preferred** the packaged sugar. No doubt it **was** cleaner—and all of them, either consciously or unconsciously appreciated it.

Sooner or later the public will realize the advantages of brick ice cream. The brick sales of most plants are increasing. In several cities the retailers are refusing service of bulk ice cream. This is due to the time required to serve and the uncertain quantity of bulk cream required to fill a quart pail.

Vanilla cream is seldom packaged, yet it is most in demand. The brick has always meant an assortment of flavors. When the public realize they can buy vanilla bricks they will buy them. Already most dealers charge ten cents per quart more for bulk than brick cream. This is a step in the right direction. The public will recognize the advantages of an ice cream brick, especially at a less price.

It is human nature to do things the easiest way. Heretofore it has been easier to handle bulk cream in the factory. The making of bricks meant a large expenditure of labor. The manufacturer passed the labor of packaging the ice cream to the dispenser. Many dispensers are today refusing to accept this added burden and very shortly the manufacturers of ice cream will be compelled to package ice cream.

Modern machinery has eliminated most of the labor. The brick box costs but slightly more than the pail. The labor required to package the ice cream in the factory is not ten per cent of that required to achieve the same results at the fountain. Any unnecessary labor is a waste, and the customer must pay for it one way or another.

You are urged to try plain vanilla bricks—packaged vanilla ice cream. Let the consumer know he can purchase the same good old-fashioned vanilla ice cream in a fresh, clean, sanitary package.

Rogers Brick Maker in Operation in General Ice Cream Co. Plant in Detroit.

SMITH & CLARK CO. PURCHASES NEW PLANT.

The Smith & Clark Company, makers of the famous Smith's Ice Craem, well known throughout all of northeastern Pennsylvania, have purchased the Scheffield Farm Dairies plant at Middletown, N. Y. The plant will serve as a distributing and manufacturing center for the territory of which Middletown is the center.

The Scheffield Farm Dairies plant is considered one of the finest of its kind in New York State, and is tiled throughout. The work of installing additional equipment is nearly completed.

The Smith & Clark Company have also opened a large station at a large station at Port Jervis, New York, which will serve as a destributing center for that territory. The purchase of a large plant at Newburgh, N. Y., is the final link in the great chain which links the Hudson River section with the home plant at Wilkes-Barre, Pa. It is no uncommon sight now to witness the pilgrimage of large fleets of orange-colored trucks over the Allegheny mountains in the direction of the Hudson river.

The Smith & Clark Company now have stations and plants at Wilkes-Barre, Scranton, Hazleton and Stroudsburg, Pennsylvania; Middletown, Port Jervis and Newburgh, N. Y.

The new $250,000 plant under construction at Scranton, Pa., is nearing completion and will be one of the finest ice cream factories in the East. It will be three stories high, of fireproof materials. It will more than double the present capacity of the company, and place them in a class among the leading ice cream manufacturers of the United States.

ANDERSON, IND., April 25, 1922.

The Marion Ice & Cold Storage Co.,
Marion, Indiana.

Gentlemen:—In reference to your letter of inquiry as to our opinion of the merits of the Four C cutting machine which has been in use in our plant some time, we are glad to state that we have found the machine to be practical, efficient and a labor saving device in the cutting of Eskimo Pies.

The machine as you know is made right here in Anderson at the plant of the Computing Cheese Cutter Company. We have had one of the first machines which they built, and from the practical operation in our plant they have had an opportunity to make some changes to increase the efficiency of the machine. This is true, with reference to the interchangeable head by which all operations were performed on the one unit cutter, necessitating the removing of one cutter for the quart brick and substituting the cutter for the 8 small pieces. This has been done away with, by the two units separately and increasing the operating the two units separately and increasing the speed in operation. We cut our bricks in the cooler outside of the hardening room, and return the pieces to the hardening room, dipping them the following day. In this way the machine can be used at any time during the day that the ice cream maker can use to best advantage. It does not therefore require an extra employee for the operation of this machine.

Yours very truly,

Superintendent.

If you are having trouble cutting Eskimo Pies, — if your cutting is taking up too much of your time, if it is costing a lot in labor

Investigate the "FOUR C" Eskimo Pie Cutter

It computes the slabs into pints and then cuts the pints into pie size. (any size you want) 12,000 to 15,000 pies per day can easily be cut.

AGENTS OR SALES AGENCIES WANTED—WIRE FOR TERRITORY

WASHINGTON—MAINE

News From Far and Near

CALIFORNIA—FLORIDA

Conway, Ark.—A. H. White has purchased some property and is having a brick building erected there to house his ice cream manufacturing plant.

Bakersfield, Cal.—The Meadowland Creamery will install an ice cream department. Mr. Nelson is manager of the plant.

Hayward, Cal.—The Hayward Ice Cream Company recently moved into their new two-story brick building. The building is modern in every respect and large enough to allow for greater expansion of the firm. It was erected at a cost of $14,000. This firm began business about a year ago and in less than six months after starting, they were crowded for room on account of the growth of their business.

Huntington, Cal.—The Consumers Quality Ice Cream Company has been organized here with capital of $50,000. H. E. Wayland, Natalie B. and Emma Gould, all of Los Angeles, are the incorporators.

Los Angeles, Cal.—The Globe Ice Cream Company is the new corporation, with Will E. Keller as president; A. A. Comey, vice president and general manager; Marco Hellman, treasurer; J. M. O'Brien, secretary; these with C. A. Fellows and Carl Leonardt forming the directorate.

By June 1 of the present year the new company will be manufacturing ice, ice cream and sherbets in an entirely new and modern $400,000 plant.

Mr. Comey, the general manager, on whose initiative the new ice cream company was formed is a trained expert; and he is the cause of having incorporated in the new plant and its distribution methods all the improvements that have suggested themselves to him during his years in the business.

Special attention has been given to the perfection of all measures for sanitatíon in the plant and the exterior will be parked and gardened so that the total effect will be in harmony with the land of sunshine and flowers. It is proposed to make a feature of inviting the public to inspect the plant and guides are to be provided for this purpose.

As soon as the ice cream and ice plants are producing, Mr. Comey states, an additional catering plant for a general catering service will be built on the same location.

Redlands, Cal.—H. Hoffman, of the Model Creamery, has just established here a large ice cream factory, which will be devoted to making ice cream in quantities for wholesale distribution to this section, including the various mountain resorts. The latest type of machinery has been installed and it is planned by the middle of the summer to have an output of several hundred gallons per day.

Richmond, Cal.—Barikas Brothers, B. J. Clark and Frank Clark announce the purchase of the plant of the Polar Ice Cream Company.

San Francisco, Cal.—Announcement of the reorganization and incorporation of the Miller Ice Cream Company of Oakland was made recently by F. E. Miller, formerly sole owner of the company. Miller was elected vice-president and general manager of the new company, with Will E. Keller of Los Angeles as president and A. S. Hopwood of Oakland as secretary.

Under the new incorporation the company will have a capitalization of $500,000.

During the last 16 years that the Miller Company has operated in Oakland there has been a rapidly growing expansion of its business, according to Miller, last year's output of some 400,000 gallons promising to be increased this year to about 700,000 gallons.

Santa Rosa, Cal.—S. Harrison, assistant manager of the Acme Ice Cream Company, San Francisco, states that his firm is contemplating building a plant here.

Tulare, Cal.—The Armour Company, manufacturers of ice cream, has sold its business to Clarence Shirk, a local business man. The latter took possession recently.

Washington, D. C.—The Chapin-Sacks Corporation will open branch ice cream plants at Winston-Salem, Greensboro, and High Point, North Carolina, in the near future.

West Palm Beach, Fla.—The Palm Beach Creamery Co. has purchased property here on which to build an ice cream plant and milk depot. Mr. Alf. R. Nielson is president of the concern.

Rome, Ga.—Donald C. Hancock has purchased an interest in the Purity Ice Cream & Creamery Co. and it is announced that he will become general manager of the business.

Mr. Hancock is well known in Rome, where he was engaged in the ice manufacturing business. Recently he bought a large ice plant at Canton. It is understood that he will have complete control of the ice cream and creamery business here and will make extensive expansion especially in promotion of the creamery business.

Chicago, Ill.—The Armick Ice Cream Company of this city has been dissolved.

Collinsville, Ill.—The Champion Milk and Ice Cream Company have remodeled a building here and began the manufacture of ice cream recently. They will also deal in other dairy products and have a very modern plant.

Clinton, Ill.—The new two-story brick building with full basement to be erected by the Clinton Ice Cream Company, was commenced recently.

East St. Louis, Ill.—The Highland Ice Cream Co. is building three additions to their plant at a total estimated cost of $75,000. Mr. A. Range is president of the concern.

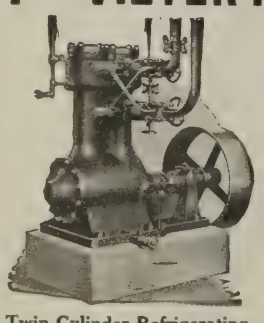
Galena, Ill.—The Galena Citizens Ice Co. opened its new ice cream department recently. This is a very well equipped ice cream plant. It is strictly sanitary in every way, with cement floors, all the wood work white enameled and the machinery is enameled or nickel plated over copper. The plant has a complete laboratory for making every test.

The capacity is 600 gallons per day. L. H. Barrett is the manager of this department and with his experience in this line will make it a successful venture.

Hillsboro, Ill.—S. W. Andrews, of Greenville, was in Hillsboro recently arranging with L. L. Walcher to open their ice cream factory at Hillsboro, which they hope to have ready for business on April 1st.

This firm expects to buy milk and manufacture ice cream exclusively. At a later date they expect to enlarge their plant and take up other dairy work.

Streator, Ill.—M. C. Coppin's ice cream plant is almost finished.



Elkhart, Ind.—The Elders Ice Cream Company will open branch plants at Goshen and Warsaw.

A new ice cream plant will be started here by the Goshen Ice Cream Company.

Fort Wayne, Ind.—The Muldoon Dairy Company is building an ice cream plant. Andrew Muldoon is general manager of the plant.

Wallas, Ind.—Messrs. Jones and Buell have opened a retail ice cream plant. They will make their own ice cream.

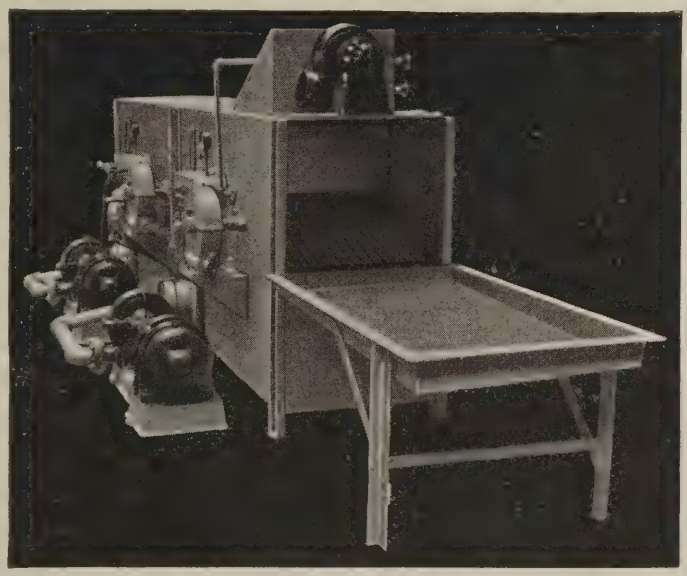
Progress Pressure Ice Cream Can Washer



MADE IN TWO SIZES

Here is a machine which will wash, rinse and sterilize ice cream cans and covers. All sizes may be fed into the machine, just as they come in on the wagons. You simply dump them onto the platform, at the receiving end (to the left in the picture), and the automatic feed carries them through the machine in a satisfactory manner for a thorough cleaning.

Capacity—The two-compartment washer, as shown in the illustration, has a capacity of ten cans and covers per minute on high speed, and six cans and covers per minute on low speed. The larger size has three compartments and three pumping units. It will handle fifteen cans and covers per minute on high speed, and ten cans and covers per minute on low speed.

Compartments — In the two-compartment machine, the first is for washing with solution; the second is for rinsing and sterilizing. In the three-compartment washer, the first is for washing with solution; the second for rinsing; and the third for a second rinsing and sterilizing.

Floor Space—The Number One machine consists of two six-foot sections. It requires a floor space five feet five inches wide, by eighteen feet long. The Number Three machine is the same width, but requires an additional six feet in length to cover the third compartment.

Strong, Substantial Construction

Being constructed in sections, the Number One machine can be easily converted into a Number Two machine at any time, by simply adding the extra section.

Construction of Tanks—The tanks are 3/16 inch rustless boiler steel, with all seams riveted and calked. The bottoms are pitched so as to readily drain to suitable three-inch perfection gate outlet.

Pumps — One pump is required for each compartment. These are of the split-shell type. Each pump has a capacity of one hundred gallons, with a nozzle pressure of 25 to 30 pounds.

Motors—Each pump is direct connected to a General Electric 1800 R. P. M. 50 degree motor, with flexible coupling. Both pump and motor are mounted on suitable cast iron sub-base. No extra motor is required to operate the machine, as transmission for the same is direct by belt drive from the motor on the solution compartment.

Covers—Each compartment is fitted with removable cover. If desired, the sterilizing department may be equipped with motor blower for removing the exhaust steam.

Special Features — Complete explanation along with the detail plan drawings and any additional information you are interested in having can easily be secured by addressing our nearest sales office.

IT IS EASIER TO GIVE ADVICE THAN TO LEND A HAND.

Arlington, Ia.—The Hutchinson Ice Cream Co. of Cedar Rapids recently opened a factory here. The local plant will be under the management of John Rupert of Cedar Rapids, who has had considerable previous experience in the Cedar Rapids plant. Mr. Hutchinson, president of the company, also made arrangements for the building of an ice house in connection with their plant here. The company is planning on serving a much larger territory from their plant at this place this year than was handled last year.

Charlton, Ia.—L. P. Douglas, who for some years has been at the head of the local home office of the Douglas Ice Cream Company, with houses in several neighboring county seat towns, has accepted a position as sales manager of the Vital Products Co., Des Moines.

The Douglas Company here will be under the management of Ray Adams, who has for about a year been actively associated with the firm. Mr. Douglas will continue to hold an interest in the plant.

Dexter, Ia.—Dexter made ice cream will soon be for sale due to the recent purchase by the Blohm cafe of a new ice cream machine. This machine will make it possible for them to manufacture all the ice cream used in their cafe. They have purchased the machine with the idea of using it for their own use and unless they change their plans they will manufacture exclusively for their own trade.

Eddyville, Ia.—Frank Reed, who for several years has been employed at Shadeland farm, is engaging in business for himself. Mr. Reed has rented and remodeled a building, making it sanitary and convenient.

Mr. Reed is an energetic worker; he has the hearty support of the trade, and with the co-operation of the cream producers he can create a worth while industry.

Fairfield, Ia.—The Hartman Ice Cream Company has just finished the installation of the most approved and efficient machinery for making frozen dainties.

The entire plant has been rebuilt, new floors laid, a new condenser and brine tanks installed and the new brine freezer is on its way.

There also is a new refrigerator in the front office where ice cream and sherbets are kept for the retail trade, and all the interior is to be finished in white enamel.

Cleanliness and sanitation are the keynote throughout the factory.

The factory will have ample capacity to take care of the local trade and also to supply a branch house which is just being established at Eldon from which shipments will be made to local points there.

Humboldt, Iowa.—The Humboldt Creamery Company has been making extensive improvements to their plant, planning to make an expenditure of over $2,000 for this purpose. They will install a viscolizer, a two hundred gallon holding vat and a two hundred gallon mixing vat in their ice cream department.

In addition to the ice cream department, this company has a creamery and a poultry and egg department.

Maquoketa, Ia.—The new ice cream plant which is being built by Kirchoff Brothers is nearly completed.

Newell, Ia.—Newell Creamery Company is having plans drawn for a handsome two story brick building to be put up in the business section of town.

Webster City, Ia.—The Webster City Ice Cream Company is to engage in business here.

H. C. Forrester, state dairy inspector, who will manage the concern, is now upon the ground supervising the work of remodeling a building. A concrete floor has been laid on the first floor and sewer connections are being made. In the basement will be placed the ice crusher and boiler.

On the first floor will be located the churn, the ice cream freezer and the wrapping room. The front part of the building will be used for an office.

It will be probably thirty days before the machinery will be in order and the place ready to run. It is proposed to turn out 2,500 gallons of ice cream per day. Butter will also be manufactured. The cream from the surrounding country, it is hoped, will supply the butter, but that for the ice cream will all be shipped from Waterloo to the ice cream factory here for the making of ice cream.

Winfield, Ia.—Doyle Shy has bought an up-to-date ice cream making outfit for his own use. Mr. Shy feels that he can give his large trade a better article with his new undertaking, and also protect himself in supply and demand. Whether he will undertake to supply other confectioners with cream and ices is not known at present.

Cherryvale, Kan.—The Bennett Ice Cream Co. was incorporated here recently with capital stock of $13,000.

Colby, Kan.—The ice cream factory will soon be ready to start.

Hutchinson, Kan.—The Cloverdale Dairy and Ice Cream Co. is installing a new ice cream machine to take care of the increase in the ice cream business.

Pittsburg, Kan.—With the purchase of the Gerhard ice cream plant, part of which will be moved to Pittsburg, and the addition of new and modern equipment, the Pittsburg Candy Company will have one of the most modern and best equipped ice cream plants in the southwest.

Stratford, Ky.—Howard Newland, proprietor of The Princess, is now making ice cream wholesale and capable judges say it is the finest ever. He has put in a plant with a capacity of 100 gallons daily and is ready to supply the merchants and others of Lincoln and adjoining counties.

Alma, Mich.—An ice cream plant is to be opened here by the Connor's Ice Cream Company of Owosso.

Bay City, Mich.—A branch of the Freeman Dairy Company of Flint has been established here.

Coldwater, Mich.—Clisbe and Brown have opened a wholesale ice cream plant here.

Grand Rapids, Mich.—The Hookstra Ice Cream Company is installing a new hardening room.

Jackson, Mich.—The Fleming Ice Cream was recently incorporated here with capital stock of $100,000. The incorporators are R. E. Fleming, Jay C. Fleming and Mrs. K. E. Fleming.

Kalamazoo, Mich.—The Beatty Ice Cream Company has opened a plant in the building formerly occupied by the Blue Ribbon Ice Cream Company.

Norway, Mich.—A new 60x80 one story brick and tile building is being constructed here to house the growing business of the Asselin Creamery Company. The new building will be equipped with all that is new and modern in creamery machinery, including a high-grade refrigerating plant of large capacity. The old plant will also remain in use, and both plants, together, will have a daily capacity of 2,000 gallons of ice cream and 6,000 pounds of butter.

Mr. Asselin states that the erection of the new building was necessitated by the growth of the business. In 1919, when Mr. Asselin secured control of the plant of the Norway Creamery Company, the yearly output of the plant was 50,000 pounds of butter and 25,000 gallons of ice cream. Under his management this output was increased in 1921 to 250,000 pounds of butter and 25,000 gallons of ice cream. During 1922 he plans to increase the output twenty-five per cent. The present daily output is 500 gallons of ice cream and 4,000 pounds of butter.

The butterfat used represents the product of about 4,000 cows.

Saranac, Mich.—The Saranac Ice Cream Company recently began the manufacture of ice cream.

Bemidji, Minn.—A meeting of ice cream makers of Minnesota was held here recently.

St. James, Minn.—The Purity Ice Cream & Dairy Co., one of the most progressive concerns of this city, are installing a larger churn for their butter business, and are also planning to enlarge their building by an addition to the rear, so as to enable them to install an eight-ton icing machine in place of their old three-ton machine, which is too small for their needs.

New Albany, Miss.—The ice cream plant now occupies a new building and have added more modern machinery.

Jackson, Miss.—New 300 gallon vats have been installed in ice cream plants at Macon, Lexington, Columbus, Aberdeen, and Kosciusko, Mississippi, and new churns have been installed in the last three of these plants. Columbus also has a new homogenizer. A 500 gallon vat was installed in the plant at Laurel.

Tupelo, Miss.—The McLeran Ice Cream Company has installed a new 500 gallon vat.

West Point, Miss.—The King Ice Cream and Creamery

If You Make ESKIMO PIES

you can increase your output—increase your profits make better Pies by using

The ECONOMY Ice Cream Cutter

Simple to operate—Durable — Saves time and labor—Cuts quart bricks into 16 equal parts for Eskimo Pies and 8 equal parts for Parties and Banquets.

Compresses edges, cuts a nice smooth surface and saves Chocolate.

Machine is made of Aluminum and Brass. Easy to keep clean.

We have so much confidence that this is the cutter you want we will ship to any point in the U. S. A., on ten days trial C. O. D. or on receipt of price $85.00 F. O. B. Salina, Kansas.

Company have remodeled and repainted their plant, and have ordered a new churn.

Meridian, Miss.—The Sealle-Lilly Ice Cream Co. have purchased a building here and are remodeling it for an ice cream plant.

Brashear, Mo.—Fervid and John Scott have started an ice cream factory here. They are using electrically driven power freezers, and expect to put out a first class product.

Kansas City, Mo.—The erection of a one million dollar dairy products plant in Kansas City, Kansas, this summer is being contemplated by the Co-operative Dairy Association, an organization embracing a membership of 1380 milk producers in territory surrounding Greater Kansas City. The association will manufacture ice cream as a part of its business.

St. Joseph, Mo.—The Green Ice Cream Co. recently completed preparations and began operating their plant. Mr. O. D. Miller is manager of the new plant.

Marshall, Mo.—Contract has been let and work begun on the building for the Missouri Ice Cream Company, recently organized. The principal investors are W. A. Sparks and Thomas Rumans.

With the building completed and fully equipped ready for business this enterprise will represent an investment of approximately $15,000.

St. Louis, Mo.—Dorr and Zeller have opened a large modern factory here. Half of the building will be used for manufacturing ice cream and the balance as a catering shop.

West Plains, Mo.—The Coca Cola Bottling Company will soon start an ice cream plant here. S. W. Paris is the manager.

David City, Neb.—J. L. Case, of David City, is preparing to open a wholesale business for the manufacture of ice cream at Wymore.

McCook, Nebr.—McCarty Brothers have sold their ice cream plant here to Claude Miller, who has taken possession.

Norfolk, Neb.—The Lewis Ice Cream Company has opened a factory at Norfolk for the manufacture of ice cream exclusively. This plant will have a capacity of 1,000 gallons a day. It is owned by Lewis Bros. Thomas Lewis is the manager.

In the fall the company intends to erect a new brick building and install a modern plant to take care of their product.

H. O. WILBUR & SONS INC.,
Philadelphia, Pa.

Auburn, N. Y.—The Dairymen's League Co-operative Association has opened its first ice cream plant here.

Cortland, N. Y.—The Cortland Ice Cream Company have begun the erection of an addition to their plant.

Jamestown, N. Y.—Peterson, Tibbett and Bufton have started an ice cream plant here. All three men were formerly in the employ of Harris Bros.

Middleton, N. Y.—Smith & Clark of Wilkes-Barre, Pa., have merged with the ice cream plant of Chas. Brunkhurst of Middletown.

New York, N. Y.—The Eskimo Manufacturing Company has been incorporated here with capital stock of $20,000. H. H. Rudloff, A. A. Stading and L. Friedland are the incorporators.

New York, N. Y.—The Manhattan Victory Ice Cream Corporation has been incorporated here with capital stock of $10,000. M. Napoli, L. Kotok, and I. Rindone are the incorporators.

Niagara Falls, N. Y.—The Grambo Ice Cream Company, Inc., is erecting a new two-story addition to its present plant, at an estimated cost of $30,000.

Norwich, N. Y.—The Norwich Ice Cream Co. has increased its capital stock from $50,000 to $100,000.

Utica, N. Y.—Joseph Zimbero will conduct an ice cream plant here under the name of the Sunshine Ice Cream Company.

Yonkers, N. Y.—The Westchester Ice Cream Company intend to remodel their plant and install new equipment.

Whitesboro, N. Y.—M. C. Copeland has sold his ice cream business to the Ideal Ice Cream Company.

Ahoskie, N. C.—Z. V. Bellamy will soon begin the operation of an ice cream plant to supply the counter trade in his drug store; he also expects to branch out into wholesale work.

Mebane, N. C.—W. S. Crawford, secretary of the chamber of commerce, is interested in establishing an ice cream, creamery, and ice plant here.

Minot, N. D.—O. A. Amundson, manager of the Bridgman-Russell Creamery at Jamestown and president of the Jamestown Chamber of Commerce, was elected president of the ice cream dealers' branch of the North Dakota Dairymen's Association which closed its three day session at Minot recently. The other officers of the ice cream branch of the association are: Vice president, S. J. La Due, Minot; secretary-treasurer, G. B. Caraway, Fargo. The executive committee consists of R. F. Bridgeman of Grand Forks and N. O. Hefte of Devils Lake, and the officers.

Velva, N. D.—A. F. Lange has sold the Velva Creamery to C. Hinkle of Athens, Wis., who expects to arrive here soon. Mr. Hinkle intends to operate an ice cream factory in connection.

Cleveland, O.—The Frizzell Ice Cream Company was recently incorporated here with capital stock of $10,000. Ralph E. Frizzell and Robert E. Kershaw are the incorporators.

Cleveland, O.—The Peerless Ice Cream Co., newly incorporated, recently began the manufacture and distribution of ice cream in Cleveland.

The plant has a capacity of 6,000 gallons a day. The product is to be distributed through retail stores and by delivery to homes.

Isadore Budin is president; Albert Joseph is secretary and treasurer, and Harry D. Zirker sales manager.

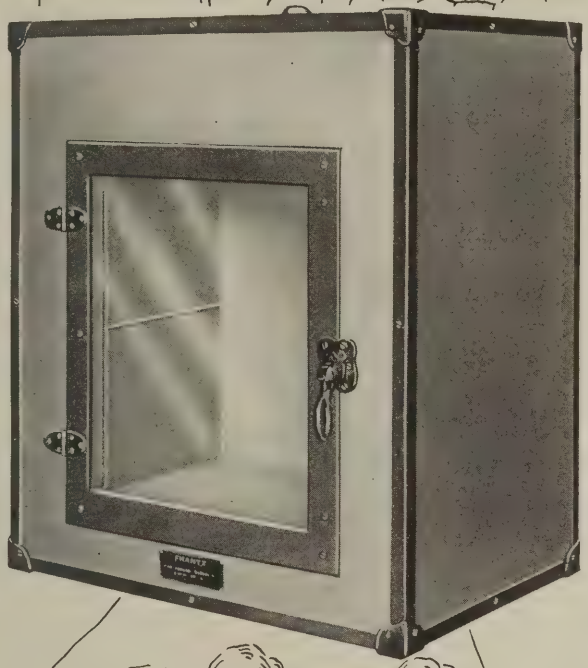
Hamilton, O.—The Ohio Ice Cream Company, of Hamilton, is opening a plant at Anderson, Indiana, under the name of the Anderson Ice Cream Co.

Hamilton, O.—A new plant will be opened here shortly under the name of the McGregor Ice Cream and Cold Storage Company.

Johnston, O.—James St. John states that he has completed the placing of the machinery in his new ice cream plant at his farm, and has begun to make ice cream. He has a very complete and modern plant, and will use the cream from his own dairy for making his cream.

McConnelsville, O.—L. D. Eveland, proprietor of the Eveland restaurant, expects to engage in the manufacture of ice cream for retail and wholesale trade in the county. Mr. Eveland has done considerable experimenting in the making of cream and has succeeded in producing a high grade quality.

Norwalk, O.—The Norwalk Dairy Co. is installing a modern ice cream freezing department. Under the new system the cream will be frozen through the use of brine instead of cracked ice. This with the installation of a modern storage room for ice cream, will put the local plant on a level with the best plants of larger cities.



Youngstown, O.—The Isely Dairy Company is opening branches in Salem, Warren and Sharon, Pa.

Muskogee, Okla.—The Muskogee Ice Cream Company has increased its capital stock from $50,000 to $75,000.

Muskogee, Okla.—The Toasted Alaska Corporation of

WHY HIDE YOUR PRODUCT *behind your dealer's counter?*

YOU spend a lot of money on cartons to attract the consumer of ice cream; you spend still more money, for advertising, to influence him to find his way to your dealer's. And then you HIDE your product in those attractive packages behind your dealer's counter!

Think of the people that make daily trips to your dealer's store who could be easily influenced to take home a package of your ice cream if the product were in full view as other purchases are being made.

The Frantz Ice Cream Counter Display Case

(Patented Feb. 1922)

now makes it possible to display an inviting array of package ice cream or chocolate coated ice cream bars, right on your dealer's counter, retaining the original temperature of the cream for 48 hours without re-icing.

The Frantz Ice Cream Counter Display Case operates on the same principle as our low temperature household refrigerating system and was developed at the request of several ice cream manufacturers who realized the tremendous advantage of constantly displaying their product instead of burying it in the old-fashioned, unsanitary and inaccessible cabinet.

Display your product— and sell more

FRANTZ REFRIGERATION CO., Inc.

406-16 N. Front St. FRANTZ International Refrigeration **READING PA.**

America was organized here recently. The incorporators are Wm. L. Lindbard, Chas. A. Berry, and Oliver E. Cramer.

Welectka, Okla.—Prothro & Son have opened an ice cream factory here.

Guelph, Ont.—Yates and Thomas are completing a large modern wholesale ice cream plant here.

Blairsville, Pa.—The Nelson Ice Cream Company, with plants at Portage and Newport News, has leased the packing plant of T. C. Brown here, and when necessary alterations are made, will make their main plant here. Machinery will be installed within the next few weeks, and when operations are begun in full the plant will have a capacity of one thousand gallons a day. The big factory will use all the surplus cream in this community, and because of the excellent shipping facilities here it will be the center of shipping for the Nelson company in this district.

Danville, Pa.—The McClow Ice Cream Company of Shamokin has purchased a former brewery plant here and will convert it into an ice cream plant.

Bradford, Pa.—The Walter Noilly Ice Cream Company is enlarging its plant.

DuBois, Pa.—Smith Brothers are planning on building a new ice cream plant.

Harrisburg, Pa.—Improvements are being made at the plant of the Hershey Creamery Company to take care of the increased demand for ice cream which, Hershey said, almost reached the summer sales record during a week of warm weather.

Larger ice cream freezers are being installed and the refrigerating facilities are being almost doubled. The improvements are to be completed in about sixty days.

Harrisburg, Pa.—Vast improvements are being made at the plant of the Hershey Creamery Company to take care of the increased demand for ice cream which, Hershey said recently, almost reached the summer sales record.

Larger ice cream freezers are being installed and the refrigerating facilities are being almost doubled. This makes possible a larger output of ice cream and the refrigerating and storage rooms have been enlarged to take care of this increased production. The improvements are to be completed in about sixty days.

Honesdale, Pa.—Gammell & Kimble will erect a two story brick building, construction to begin at once, to enable them to take care of their fast growing ice cream business. The new place will have a capacity of 500 gallons of ice cream a day and with additional equipment double that amount will be handled easily.

The ice cream will be manufactured on the first floor while the second will be used for salt and material storage. Convenient arrangements will enable the enterprising concern to make their product with minimum amount of labor.

Middleton, Pa.—Ardel Light, formerly of this place, but a recent resident of Elizabethtown, recently purchased the ice cream manufacturing machinery of Stype and Cain.

Light will remodel a building here and expects to be open for business shortly.

Clymer, Pa.—The Clymer Dairy Products Company was recently organized here with capital stock of $15,000. The firm is putting up a new building which will be completed in about three weeks. This company will make butter and ice cream and handle dairy products generally. A dairy plant is a new undertaking in this community, but the prospects look good, and the promoters are enthusiastic about the business.

Pottstown, Pa.—Ground was broken here recently for a $60,000 addition to Burdan Bros. ice cream plant.

St. Marys, Pa.—The Shaffer Ice Cream Company, which recently purchased the plant and good will of Hedberg and Co., is growing rapidly.

A number of alterations have been made by the new manager. A new refrigerating machine has been installed. A new 100 gallon mixer, and the added freezing facilities gives the plant a capacity of 500 gallons of ice cream a day.

Mr. Shaffer has had 15 years' experience in the ice cream business, and knows the business from both ends. Later on in the season he expects to institute family service, When ice cream will be delivered to families in any part of the town.

Scranton, Pa.—The plant of the famous Sheffield Farms Dairy at Middletown, N. Y., has been acquired by the Smith & Clark Company, of Scranton and Wilkes-Barre, manufacturers of Smith's ice cream.

Shamrock, Pa.—Breyer's Ice Cream Co., of Philedelphia, will erect an $80,000 milk station and ice cream plant here.

Stroudsburg, Pa.—Smith and Clark of Wilkes-Barre, Pa., have taken over the White Ice Cream Company and are making extensive alterations on the plant.

Washington, Pa.—The Carothers Dairy Company has established a branch or service station in Waynesburg, from which all of Greene County will be served with the Carothers ice cream and ices. The new branch will be in charge of Thomas Griffin, who has been in the employ of the Carothers company in Washington for the past three years.

The Carothers Dairy Company has enlarged considerably during the past year, and its products are sold over a large area. Last year a service station was established in Carnegie, which has been very successful. This, with the Waynesburg station, makes an area of about 50 miles that is covered.

Williamsport, Pa.—Mr. Chris. Frey, proprietor of a small ice cream plant here, is remodeling an adjacent building and will use it in his business.

Wilkes-Barre, Pa.—The M. & G. Ice Cream Company of Allentown, was granted a permit to erect a service station on Scott Street, East End. It is to cost $11,000.

Youngsville, Pa.—The Miller Ice Cream Company, of which Tony Miller is proprietor, is building an addition to the present plant.

Providence, R. I.—The Kelley Ice Cream Company is building a new one-story brick plant.

Chester, S. C.—The Gastonia Ice Cream Company have purchased an 8-ton belt driven York refrigerating machine.

Memphis, Tenn.—W. H. Fortune, manager of Fortune's Ice Cream Plant, is going to install a 12-ton York belt driven refrigerating machine.

Nashville, Tenn.—Union Ice Cream Co. are having plans prepared for a three story, brick and reinforced concrete factory to cost approximately $200,000.

Sweetwater, Tenn.—Machinery has been installed in the cold storage building of Chapin-Sacks Corporation, recently completed, and the firm is now manufacturing ice cream.

Austin, Tex.—The Meyer Dairy Company is to establish an ice cream plant here which will be in operation in about six weeks. Mr. Meyer, founder of the Meyer Dairy Company, was formerly with the Austin Ice Cream Company.

Corpus Christi, Tex.—The Cloverdale Ice Cream Company has increased its capital stock from $25,000 to $50,000.

Lubbock, Tex.—The Lubbock Creamery is beginning the remodeling of the building at the corner of 1st Avenue and 14th Street, in which place they expect to install one of the most modern ice cream factories and cold storage plants in this part of the state.

PROF. BAER'S INQUIRY DEPARTMENT.

(Continued from page 56)

Dear Sir:—I obtained a formula recently, which I would like to have you pass on, if you will be kind enough.

For a 30-gallon ice cream mix: Thoroughly dissolve 13½ pounds powdered skimmilk in 25 gallons 12 per cent cream (place powder on top of cream and whip in with bakers' whip). Then add 33¾ pounds sugar and 2 pounds gelatine dissolved in seven-eighth gallon water. Flavor and freeze.

Will this test out 9.5 per cent butterfat and 33.5 per cent total solids. A. I. C. CO.

Reply: I am giving you below in Table No. 1 my analysis of this mix. You will notice that the final result of the per cent of all ingredients is very nearly what you expected it would be.

Table No. 1.

Ingredients	Fat	Serum Solids	Total Solids
25 gal. 12% cream, 210.0 lbs.	25.2	16.47	41.67
Skimmilk powder, 13.5 lbs.	....	12.82	12.82
Sugar, 33.75 lbs.	....	.....	32.06
Gelatine, 2.00 lbs.	....	.....	1.90
Water, 7.30 lbs.	....	.....	.....
266.55 lbs.	25.2	29.29	88.45
Per cent	9.47	11.0	33.2

* * *

Dear Sir:—Below is the formula for mix we are using now. Our ice cream has a good body and holds up well with this exception. When not kept perfectly hard, becomes sort of sticky. In transferring or dishing it sticks more or less to anything used in the operation.

Ingredients	Fat	Serum Solids	Total Solids
125 lbs. sugar	....	.....	118.7
8 lbs. gelatine	....	.....	6.0
600 lbs. milk 3%	18.0	52.4	60.4
109 lbs. butter 84%	92.0	.....	92.0
50 lbs. milk powder	....	48.0	48.0
108 lbs. water	....	.....	.....
1,000 lbs.	110.0	100.0	325.1
Per cent	11.0	10	32.5

We use a viscolizer, run it at 1,300 pounds after having been heated to 145 degrees and held 30 minutes. We run gelatine and all through the viscolizer. Would that make any difference?

If you can suggest any change in this would appreciate your doing so. C. & A.

Reply: I have your letter of November 9th and I am glad to advise that on looking over your mix I am of the opinion that you are using too large an amount of gelatine. This large amount of gelatine is what makes the ice cream "sticky." You are now using, according to your formula, .8 per cent. You undoubtedly have a grade of gelatine which would produce good results if you used from .4 to .5 of one per cent.

I suggest that you try cutting down the gelatine and see whether your trouble is not eliminated.

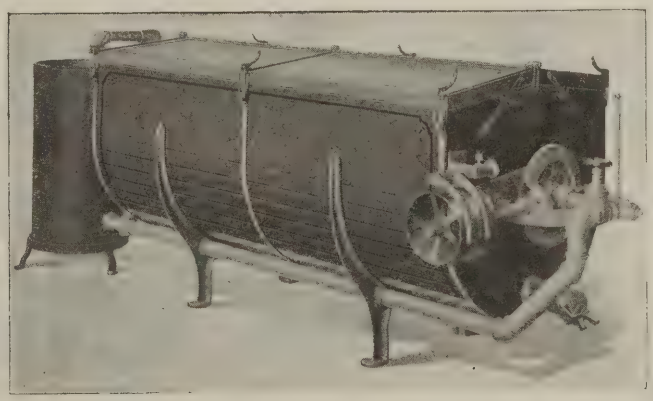
* * *

Dear Sir:—A customer in trouble writes that he has been making ice cream using a formula of 5½ gallons, 25% butterfat cream, 7 lbs. sugar and vanilla to flavor, making a ten gallon batch. He finds this too expensive and, while his product is extremely rich, he believes he could get more customers if it were not quite so rich.

He would like to try about a 10% product. While we are not entirely familiar with the requirements it would seem that a 10% product would be pretty low in butterfat. We would be very gland to have you give us a little knowledge along this line, also give us formula

The Covers Are Insulated

There is absolutely no waste of heat or cold in the Manning Batch Mixer. Even the covers are insulated with heavy linofelt.



This feature, found only on vats of Manning construction, is just one of the many details that go far to make the Manning the most perfectly built vat on the market.

Ice cream manufacturers, everywhere, have found that they can depend upon the Manning.

MANNING EQUIPMENT

MANNING MANUFACTURING COMPANY

Rutland, Vermont U. S. A.

The First Cost,— Low as it is,— Is Practically the Last!

which would comply with requirements in the state of ——. W. K. J. Co.

Reply: If your customer is making ice cream entirely from 25% cream, sugar and flavor he is making a product which will test about 18 to 20% butterfat. Your customer must be a small manufacturer of ice cream, as I know of no large manufacturing concern which would make ice cream of that composition. The law of —— requires 8 per cent butterfat and most of the large manufacturers make an 8 per cent article.

I would suggest the formula for a 10% ice cream, but it probably would not be satisfactory to your customer unless he is familiar with the manufacture of a 10% product. It might be well to write to him and ask him whether, if the butterfat content is reduced to 10% he would want to increase the milk serum solids in the products. This would make it necessary to not only reduce his 25% cream with milk or skimmilk but also to use skimmilk powder or condensed milk to break up the serum solids. You might suggest to your customer that he write to me direct giving more detailed information, and I am sure that I can help him out in a satisfactory manner.

* * *

Dear Sir:—Will you please give me the following formulas for making a 14% butterfat ice cream, 35% solids, using the following ingredients: sweet butter, 189 pounds; skim milk powder, water and sweetened condensed skim milk containing 28 to 30% milk solids and 40% cane sugar.?

We use 7 lbs. of sugar to 5½ gallons of mix, 6 oz. of Purity ice cream powder and 1 oz. of gum and 3 oz. vanilla. We wish to use gelatine instead of gum.

We use a homogenizer and run the entire mix thru at 2,500 lbs. pressure at 160 degreese F.

The reason for giving the amount of butter at 189 lbs. is it is three tubs and that is all we can mix at a time as our mix is small.

We hold from 24 to 48 hours in the holding vat at from 40 to 45 degrees above zero.

Also please give us a formula to make a 14% ice cream, 35% solids, using 189 lbs. butter, skim milk powder, water and sweetened skim condensed milk, 32% solids and 44% sugar. The only difference in the first and second formulas is in the sweetened skim condensed milk. J. R. D.

Reply: You will find below in Table No. 1 the ice cream which you gave in your letter analyzed the best I could from the information which you gave me. I am also suggesting in Table No. 2 a similar formula made up with a different kind of sweetened condensed milk and skim milk powder.

Table No. 1.

Ingredients	Fat	Serum Sol.	Total Sol.
81.2 lbs. sugar	.....	.....	67.60
5.0 lbs. gelatine	.....	.....	4.70
200.0 lbs. sweet condensed	.....	56.00	136.00
189.0 lbs. 80% butter	151.20	.....	151.20
21.0 lbs. skimmilk powder	.....	20.00	20.00
593.8 lbs. water	.....	.....	.....
1080.0 lbs.	151.20	76.00	379.50
Per cent	14.0	7.0	35.0

Per cent sugar, 14.0.

Table No. 2.

Ingredients	Fat	Serum Sol.	Total Sol.
80.8 lbs. sugar	.....	.....	76.70
5.0 lbs. gelatine	.....	.....	4.70
160.0 lbs. sweet condensed	.....	51.20	121.60
189.0 lbs. 80% butter	151.20	.....	151.20
26.0 lbs. skimmilk powder	.....	24.80	24.80
619.2 lbs. water	.....	.....	.....
1080.0 lbs.	151.20	76.00	379.00
Per cent	14.0	7.0	35.0

* * *

Dear Sir:—Could you kindly advise me what the trouble is with my cream? My ice cream mix turns stringy when I add the gelatine.

I use a mix that tests about 20% butterfat. I add 9 lbs. sugar to a 10 gallon mix, finished, and ½ pound gelatine and 4 oz. vanilla. What do you think about this mix? I use nothing but sweet milk for reducing my cream, which tests about 35%. P. M.

Reply: The reason why your ice cream turns "stringy" when you add the gelatine is because the gelatine is not incorporated into the mix. You are trying to incorporate hot gelatine into a cold mix without having the gelatine hot enough and without giving sufficient agitation while you stir it into the mix.

You are undoubtedly making ice cream from raw materials without pasteurization for you would not have the trouble with "stringy" mix if you pasteurized it.

I suggest that you heat your gelatine a little hotter and then stir it into a part of the mix first so that it will not congela or become stringy and then add it to the remainder of the mix.

* * *

Dear Sir:—Do you consider that I would get as good an ice cream by using cream and skim milk powder, as by using a mix consisting of cream, milk, condensed milk and skim milk, as I find so many plants do?

W. D. D.

Reply: We have hundreds of factories that are using skimmilk powder instead of condensed milk and I know that they are having good results. It must be remembered, however, that the skimmilk powder should be the perfectly soluble product and have no "off" flavors.

"Price is a relative term—quality always a concrete fact."

A NEW PRICE BUYING BASIS

Among the new Standards set by Delft—aside from Purity and Freedom from Bacteria—is **UNIFORMITY.**

With **100 per cent** UNIFORMITY, the Buyer has a **guarantee** against loss and worry. Having this, we can figure the actual usage necessary and, at the price for a grade, give the actual per unit MIX. This proves that the **highest** grades are the **cheapest.**
Buyers should **forget** the **first** cost and buy the grade, which, at amount used, figures the cheapest.

We have scores of the wisest buyers now buying on this **new** price basis. It's a **revelation** to buyers—and it saves money for them.

MEMBER

Harold A. Sinclair

We have experimented quite a bit along this matter and we find that we get less flavor imparted to our ice cream by using powder than by using condensed milk.

* * *

Dear Sir:—Your letter and analysis at hand and greatly appreciated. In reply wish to say that we wish to have our fat and sugar run at 14% each. Last season we run our mix (80 gal.) as formula No. 1, as given below, but were advised we were low in fats and solids so we changed to No. 2, but this wasn't satisfactory so we appeal to you for your valued correction:

Table No. 1.	Table No. 2.
20 gal. 40% cream.	30 gal. 40% cream.
20 gal. 8% condensed milk.	30 gal. 8% condensed milk.
40 gal. 3.5% milk.	10 gal. 3.5% milk.
1½ gal. water.	1½ gal. water.
3 lbs. gelatine.	3 lbs. gelatine.
100 lbs. sugar.	100 lbs. sugar.
32 oz. flavor.	32 oz. flavor.

F. V. H.

Reply: I have your letter relative to your two ice cream mixes which you desire to have analyzed. I am glad to show you below in Table No. 1 and Table No. 2 the analysis of your two mixes:

Table No. 1.

Ingredients	Fat	Serum Sol.	Total Sol.
20 gal. or 158 lbs. 40% cream	63.20	8.46	71.66
20 gal. or 180 lbs. 8% condensed	14.40	32.40	46.80
40 gal. or 344 lbs. 3.5% milk.	12.04	29.55	41.59
1½ gal, or 12.5 lbs. water	.....	.....	.....
3.0 lbs. gelatine	.....	.....	2.95
100 lbs. sugar	.....	.....	95.00
2 lbs. vanilla	.....	.....	.30
799.5 lbs.	89.64	70.41	258.30
Per cent	11.2	8.8	32.28

Per cent sugar, 12.5.

Table No. 2.

Ingredients	Fat	Serum Sol.	Total Sol.
30 gal. or 237 lbs. 40% cream.	94.80	12.64	107.44
30 gal. or 270 lbs. 8% condensed	21.60	48.60	70.20
10 gal. or 86 lbs. 3.5% milk.	3.01	7.39	10.40
12.5 lbs. water	.....	.....	.....
3 lbs. gelatine	.....	.....	2.95
100 lbs. sugar	.....	.....	95.00
2 lbs. vanilla	.....	.....	.30
710.5 lbs.	119.41	68.63	286.29
Per cent	16.8	9.66	39.7

Per cent sugar, 14.08.

You will notice that your first mix tested 11.2% fat, about 32% total solids, a percent of sugar of about 12.5%. Your formula number two you will notice figures out almost 17% fat showing 14% sugar, and nearly 40% total solids. I notice that your formula number two contains 700 lb.mix. I am indicating in Table No. 3 a formula for 100 lb. of mix which I believe is balanced just about right for 14% butterfat and 14% sugar. In order to make up 700 lbs. similar to your mix in Table No. 2, all you will have to do is to multiply the ingredients by seven, or, if you wanted your total 800 lbs., as in Table No. 1, multiply by eight.

Table No. 3.

Ingredients	Fat	Serum Sol.	Total Sol.
14.0 lbs. sugar	.....	.....	13.30
.5 lbs. gelatine	.....	.....	.475
25.0 lbs. 8% condensed	2.00	4.50	6.50
27.2 lbs. 40% cream	10.88	1.45	12.33
33.3 lbs. 3.5% milk	1.16	2.90	4.06
100.0 lbs.	14.04	8.85	36.665

To make up 700 pounds, as per your Table No. 2, multiply all ingredients by 7—or for your Table No. 1, to get 800 pounds, multply by 8.

I trust that with this assistance you will have no trouble in keeping your mix exactly 14% fat, as you expect to have it. You understand, of course, that you will not have 40% cream every day nor will your milk test 3.5% continually. This will mean that you will have to vary the amount of cream and milk in order to give you 12 lbs. of butterfat which, added to the 2 lbs. which you have in your 25 lbs. of condensed, will make the 14 pounrs of fat.

If you continue to figure your mix on the 100 lb. basis you will notice that it tests 14% if you have 14 lbs. pounds of fat.

⚜

PORT ANGELES CREAMERY TO MOVE INTO NEW BUILDING.

About a year ago the Angeles Co-operative Creamery purchased from G. H. Ustler the business which he conducted under the name of the Port Angeles Dairy, and since that time has been operating the two plants separately. In their building, which is expected to be ready for occupation about June first, the two plants will be combined under one roof. This building is a 50 by 140 foot frame structure, with a concrete floor.

The capital invested, not including the building, is about $20,000. Directors are Albert Eacrett, president; John Winters, secretary-treasurer; R. H. Kidd, Frank Fisher and W. T. McFall. G. H. Ustler is manager.

The company will deal in milk, cream, butter and ice cream.

⚜

You'll make better ice cream if you get the "Ice Cream Review."

California and Southwestern States Ice Cream Mfrs' Ass'n

Proceedings of Seventh Annual Convention, Held in Stockton, California

THE California and Southwestern States Ice Cream Manufacturers' Association held its seventh annual convention in conjunction with the Pacific Slope Dairy Products Show in Stockton, on Dec. 5 and 6, 1921. The attendance was the largest ever known and the meeting was interesting from every standpoint.

Ice Cream Exhibit.

There were 24 samples of ice cream on exhibition and the gold medal was won by William Dreyer, Visalia, with a score of 95½, the silver medal went to Robert J. Dryden, Oakland, with a score of 95, and the bronze medal was captured by E. W. Chism, Reno, Nevada, with a score of 94 points, based on the following:

Ice Cream Score Card.

(Approved by Dairy Division, University of California)

Items—	Possible Score Pct.	Amount Allowed (1)	(2)	(3)
Flavor and palatability	50	46½	45½	45
Texture and body	25	24	24½	24
Appearance (color)	10	10	10	10
"A" Butterfat	5	5	5	5
"B" total solids	10	10	10	10
Total	100	95½	95	94
ANALYSIS.				
Butterfat, per cent		11.3	11.14	11.37
Total solids, per cent		36.0	36.3	40.03

"A"—A perfect score shall be allowed ice cream containing 10 to 12 per cent butterfat, inclusive. Deduct 1 point for each one-half per cent above 12 per cent. Less than 10 per cent score is zero.

"B"—A perfect score shall be allowed ice cream containing 36 per cent total solids or above. For each per cent less than 36 per cent deduct 2 points.

When the directors held an executive meeting at the close of the last regular session the following officers were elected:

President—L. W. Wilson, Fresno, manager Benham's Ice Cream Co.

Vice-President—C. J. Alfred, Los Angeles, manager Alfred Ice Cream Co.

Secretary-Treasurer—R. J. Dryden, Oakland, manager Kream of Kream Ice Cream Co.

* * *

CRITIC'S REPORT OF SCORING.

Last year there was some doubt in the minds of some of the ice cream manufacturers as to the value of a competition ice cream scoring contest, and as a result only fourteen manufacturers had entries. This year there exists a much different feeling, and twenty-four manufacturers made entries of their stock cream. Three gallons of stock vanilla constituted an exhibit. The ice cream was scored by C. J. Alfred, of Los Angeles, and S. L. Denning, of Oakland, and G. D. Turnbow, University of California, Davis, the same judges that scored the cream last year, and it is the general opinion of these judges that there was a very marked increase in the quality of the ice cream and there was also a very good indication that practically every sample of cream was stock cream.

The value of such a contest does not rest with simply the placing of the ice cream in this contest as it is conducted, in that as soon as the official scoring has been done, a score card with the criticisms is placed above each entry, and the manufacturers go over the ice cream in detail, and here they have a chance to compare their ice cream (if they are able to recognize it) with that of other manufacturers. This I consider to be the most valuable part of the contest. In one case that I know of, one manufacturer that had been cut a half a point on high color went over the ice cream and remarked that this ice cream should have been cut more because of its high color. He did not know at that time that he was criticising his own ice cream. This simply goes to show that we are not always absolutely sure of the product that we are making, and it is questionable whether your own product is always so outstanding as we sometimes think. I feel that the ice cream manufacturers have confidence in the value of such a contest and there is no doubt in my mind that if properly conducted in future it will be one of the interesting and important features at the ice cream convention, as well as accomplishing one

FIRST SESSION.

President S. A. W. Carver, Presiding, Called to Order at 2:30 P. M.

The President: Ladies and Gentlemen, the seventh annual convention of the California and Southwestern States Ice Cream Manufacturers' Association is now in session. From appearances I believe we are the beginning of the biggest, best and most beneficial convention of ice cream people that has been held in the southwest. Before we go on with the formal program of the afternoon, we have with us Mr. Green, the head of the state dairy council, and it is of very great interest to us, as well as of importance, that he make a few statements and announcements regarding what is before us for the entire week in the grouping of all the different branches of the dairy industry in the several conventions that succeed each other in connection with the state dairy show, and the exhibits, all of which is largely under the direction of the state dairy bureau. I will now call on Mr. Green for a few statements.

Mr. Sam H. Green: Mr. President and members of the California and Southwestern States Ice Cream Manufacturers' Association,—you notice I have to stop and take a breath—I advise your committee to shorten up that title one of these days.

As a temporaneous resident of Stockton I have been directed by the mayor to represent him and extend the hand of greeting of the city of Stockton to the members of this organization. The people here, I call tell you from a personal standpoint, are glad to have you here, and they have done a lot of things to make your convention a pleasant one and you yourselves will, of course, make it profitable.

On behalf of the California Dairy Council, and the First Annual Pacific Slope Dairy Products Show, which the Dairy Council has sponsored, I also bid you welcome, and in doing that I want to extend the thanks of the board of directors of the California Dairy Council to this organization for this splendid evidence of your generous co-operation by deciding to hold your seventh annual convention here, in conjunction with the Dairy Products Show. If you had not done that the show would have been lop-sided. I am only sorry that you are not holding your convention out there in Convention hall, which adjoins the exhibit hall, instead of holding it here, for I want you all to feel that you are a part of that show, and perhaps the word "show" is not exactly proper to use for it is more than "show," it is an attempt to visualize to ourselves and for others the comprehensiveness of the various branches of the dairy industry.

Now that is a small affair out there from the standpoint of size, but I believe you will agree with me when you see it that it is pretty fairly complete—pretty fairly complete and quite a creditable show to have for the first effort. You will find out there a splendid exhibit of the dairy division of the United States department of agriculture, a portion of the great one which they had at the national dairy show in Minneapolis in October, and which was brought from there to Portland. You will find exhibits of the state department of agriculture, of the University of California, of the California Dairy Council and of the several counties that are adjacent to this city, as well as the exhibits of all manufacturers of dairy products.

You all know of the scoring contests that were set up for milk, cream, butter, cheese and ice cream, and you will find the winning entries all on exhibit there.

Your convention occupies today and tomorrow. On Wednesday, in the Convention hall there will be held the first annual convention of the State Milk Distributors' Association. On Thursday will be the second annual convention of the California Dairy Council and on Friday will be the twenty-third annual convention of California Creamery Operators' Association, which runs over into Saturday. In conjunction with the second annual convention of California butter, cheese and ice cream makers will be held so you see there will be conventions every day this week, and like yourselves, each one of these other organizations has a very interesting educational program; some of the foremost men in the industry on the Pacific coast are here or will be here.

Now, the show opens to the public at noon tomorrow and will be officially opened at 8 o'clock tomorrow evening with an address by Dr. David P. Barrows, president of the University of California. There will be good music there every evening and many special numbers so that you will find it entertaining to be there at any time.

I have looked over your program and I see that it is a very full one. It is going to occupy a great deal of your time, and yet I want to urge upon you to find time to get out there and become acquainted with all the other men that you will meet there who are in the various branches of the industry. I do not want you to think that this little show out here was just a thought of the moment, because it is not a small one. You might easily make that mistake, but this little affair is based

upon constructive thought and a good deal of consultation. Looking far ahead. There are men who see the time when the Pacific slope will be the great dairying section of this nation, and that now is the time to begin to prepare for that and head it up, and looking forward to that time we know that we must have an annual gathering of all the branches of the industry, and the only way we get that annual gathering is to have a dairy show, and so, one of these days, if everything goes well, you will find that word "products" eliminated from the title, and then you will have the name, "Pacific Slope Dairy Show," and I want to make this request of you, Mr. President, that when the time comes for you to take up the special business of your organization, that you appoint a committee of—three I think—who shall serve with similar committees from the other organizations, and that a committee of the exhibitors there, to handle another show next year. It is not the work of the Dairy Council to give dairy shows. We have given this one as a demonstration, just as we have done a number of different things to demonstrate the work of the Dairy Council to promote the very best interest of the industry, and in so doing we consider this show one of the best acts we have performed, but we must not be expected to continue to operate these. Our work is in another field and until a regular show association shall be formed, the only practicable way that comes to my mind for the handling of this business is to have it handled by committees of the organizations that are interested, and of the exhibitors who make the show a success, so I repeat what I said in the beginning, that you are welcomed here at the hands of the officials of the city of Stockton; you are welcomed here at the hands of the Dairy Council and of the Pacific Slope Dairy Show, and I hope you will have a successful convention and a royal good time. Thank you.

The President: On behalf of the ladies' reception committee, at the suggestion of Mrs. Miller, I wish to announce that she wishes the announcement made that visiting ladies will be entertained at noon luncheon tomorrow at the Hotel Stockton as the guests of the ladies' reception committee. All visiting ladies please remember this, and I am sure it will be a very pleasant occasion and one that the local reception committee are extending to you and would enjoy with you very much.

The secretary has some announcements to make also:

The Secretary: We have a letter here from Mr. Robb, president of the Pacific Ice Cream Manufacturers' Association, which I will read: (Reading)

PACIFIC ICE CREAM MANUFACTURERS' ASSOCIATION,
OFFICE OF THE PRESIDENT.

Seattle, Wash., Nov. 30, 1921.

Mr. S. A. W. Carver, President,
California & Southwestern States Ice Cream
Manufacturers' Association,
Stockton, California.
Dear Sir:

I regret that I am unable to extend personally to you and the members of your association our greetings on the occasion of your annual convention. We are sending to you, however, two of our officers, Mr. J. E. Dunne, past president, and Mr. Bert Walker, our genial secretary. In these men you will find typified the aggressive and constructive spirit of the Pacific Ice Cream Manufacturers' Association, since it has been through the untiring efforts of men such as these that our association has achieved its present standing.

If I were asked to name the feature of our recent convention that made the deepest impression upon me, I would unhesitatingly say that it was the attendance of the strong California delegation, and I wish to take this occasion to extend our thanks to these men, who helped so greatly to make our meeting a success.

I cannot too strongly urge the importance of the closest relationship between our associations, and wish to assure you that we shall always undertake to further it. We are

looking forward to the time in the not far distant future when it may be propitious to hold a joint convention with the California association.

With all good wishes for the success of your convention, and for a happy and prosperous New Year for your association and its members, I am

Sincerely yours,
W. V. S. ROBB, President.

The Secretary: We also have a telegram here from Mr. Dunne, of Portland.

Portland, Ore., Dec. 5, 1921.

Mr. Dryden, Secretary,
California and Southwestern Ice Cream
Manufacturers' Association,
Hotel Stockton, Stockton, Calif.

Sorry cannot be with you today. Circumstances beyond my control has compelled me to cancel my reservations on Saturday and again Sunday, rendering my presence there even late impossible. Stop, you haven't the slightest idea how badly I feel about my enforced absence. I had planned on having the best time of my life and to have it all knocked in the head, well, to say the least, is mighty disgusting. They won't accept my profanity by wire and language fails me as I write.

JOE DUNNE

The President: The next on the order of business will be the report of the secretary-treasurer.

Secretary-Treasurer: Why, the report of the secretary-treasurer is confined to the balance statement of our assets and liabilities, and we are rather pleased to report that we have one hundred and fifty-seven members, an increase of about eighty-five or ninety members. We have in our treasury $2,268.41. We purchased some equipment amounting to $162.00. We have unpaid memberships of $250.00, or a total asset of $2,680.76. Our liabilities are accounts unpaid, $392.00. It is hard to close our books because some bills were created for our convention here. Memberships received during

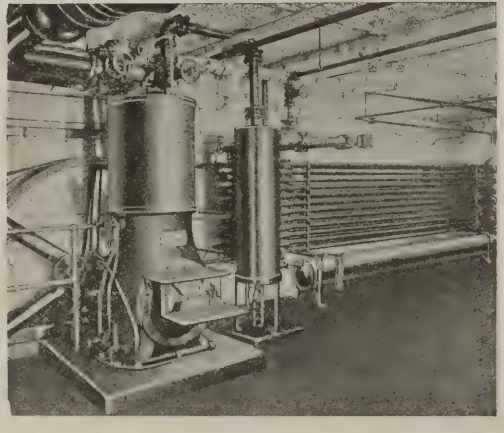
Baker Refrigeration

Making ice cream profitably is a problem of refrigeration—the efficiency and economy of your refrigerating system is all-important.



Baker Refrigerating Engineers understand the needs of the ice cream industry —they know how to design refrigerating equipment for greater efficiency, greater economy and dependability.

With a Baker System especially designed to meet their individual requirements, many smaller ice cream plants have developed big plant methods—low refrigerating costs and increased production has made them bigger. Big plants have grown bigger, too, with Baker refrigeration.

Baker Refrigerating Engineers are at your service—they can solve your problem be it great or small.

the year were $2,140.00, balance carried over from last year, $1,748.00. In my report I have an itemized list of the expenses for the year, which I would refer to the auditing committee. That constitutes my report

Mr. Christopher: I move that the report of the secretary-treasurer be accepted. Motion seconded from the house and carried.

The President: Has the convention any instructions in regard to the usual custom of an auditing committee in connection with accepting the report. If not the motion is that the report be received and placed on file and I think I shall take the liberty, pursuant to the usual precedent of naming the auditing committee to run over it and report later in the convention so that the record will show that it is O. K. in every respect. All in favor, say "AYE." (Passed). I will announce that committee a little later.

The President: A proper matter of form would be that the minutes of the last annual convention should be read. It is a little too long a record to stop in the midst of a convention to read those, so that the usual practice is either a motion that the reading of the minutes be dispensed with, and that they be placed on file, or that they be referred to a committee to examine and report briefly of them. I think it is too long a record to read. What is your pleasure?

Mr. K. L. Carver: I make a motion that the reading of the minutes of the last annual meeting be dispensed with. Seconded from the floor.

The President: It is moved and seconded that the reading of the minutes of the last annual meeting be dispensed with. All in favor make the usual sign. (Passed). The motion prevails.

The President: Ladies and Gentlemen, the next item on the program is a few remarks by the President. I am not in very good physical condition. I really ought not to be here, so I may be disturbed and interrupted a little during the course of the reading of the few remarks that I have to make. I have a pretty bad cold, a persistent cough, but I will do the best I can.

The few remarks I wish to make are along the line of a subject that is attracting a good deal of attention in the last few years in business circles — both official and in business channels, namely, trade associations, and then many aspects of the functions of trade associations which I will briefly touch upon.

Trade Associations.

Trade associations and conventions are becoming almost the universal order of the day in every line of business.

It may safely be taken as a sure index of progressive prosperity, or the opposite, to observe whether or not any man or any firm is actively interested in some live trade organization representing his or its particular line of business. In spite of public suspicion, criticism and legislation that was rampant a few years ago, there is manifest everywhere to-day a rapidly increasing recognition of the fact that these associations are not only a necessity, but that they are a positive public benefit.

Secretary Hoover, in a recent address, said: "All are agreed that the purposes and actions of the vast majority of trade associations are a constructive contribution to public welfare. Their activity in promotion of better business practices, advancement of technical processes, simplification of production, standardization of uality, extension of trade, commercial arbitration, etc., all make for more efficient industry and business. Many of them collect information as to production, stocks of raw and other material, percentage of industry in active operation, total orders in hand,—all of which, when available to the public, contribute both to stability and

the increasing efficiency of industry, and to the protection both of the smaller manufacturer and the consumer."

This statement by Mr. Hoover is so concise, comprehensive and yet pertinent, that it affords me a good text for discussing and enlarging upon several of the association functions which he mentions. Trade associations are coming rapidly to see and appreciate the importance of these channels of activity and are developing some real constructive policies and showing some real beneficial results.

Standards and Quality.

The ice cream industry is insisting upon the recognition and classification of ice cream as a dairy food, and as a dairy product of equal importance and food value with milk, cream, butter and cheese; but in the past we have not always been open-minded and frank with the public or honest with ourselves when it came to the test of quality or the manufacture of the goods, or to the framing of definitions and standards.

The spirit of commercialism and greed is still too prevalent in the industry, and the ice cream makers in too many cases insists on making his goods in his own way according to his own formula, which he may have learned twenty years ago. There are hundreds of these formulas, all more or less different. Too much attention is given to making the goods as cheaply as possible and so that they will stand as much abuse and neglect as possible while being marketed. This is a poor substitute for the service we owe the public in the way of better quality and better care of the goods while in distribution. As a result we have not gained the confidence and endorsement of the public and the health officials as fully

ACCURATE AND INSTANTANEOUS TESTING OF OVERRUN IS THE RESULT OF A GOOD TESTER.

as we should. In all such matters I believe we should take the lead. In a spirit of service and education, to help perfect and improve and stabilize our standards and quality, and to more worthily inspire the confidence of the public in our product and in its dependible and superlative value as a food. If we expect adequately to increase the consumption of ice cream, we must not be actuated by the spirit of cheap commercialism in matters of quality and standards. Too often we show an unwillingness to face the limelight of public scrutiny, when we should be inviting it. A few examples of what I refer to will illustrate my meaning.

In one definition of ice cream, or of the standard of ingredients for same, it is prohibited to use "any ingredient which is known to be unwholesome." Can you imagine anything more ridiculous? How could it be proven that the manufacturer know the ingredient was unwholesome? The use of any ingredients that is unsanitary, impure, or unwholesome should be prohibited, whether the manufacturer knew it or not. It is his business to know it before he uses it. Another definition and standard that is very objectionable, because too long, too involved, uncertain and indefinite, and because it dwells too much on the possibilities of filth and infection in the goods, reads, in part, as follows:

"Ice cream is a frozen product, varied as to kind and proportion of ingredients, within the limits established by custom and usage. It consists chiefly of a sweetened and flavored mixture of cream, or cream and milk, or milk with or without added milk fat in the form of sound, sweet butter; or as contained in condensed, evaporated or concentrated milk, or in milk powder, and with or without added milk solids not fat in the form of skim milk powder or as contained in milk powder or in condensed, evaporated or concentrated skim milk; or of a sweetened and flavored homogenized or emulsified mixture of a sound sweet butter, milk powder or skim milk powder and water, with the addition of gelatine, vegetable gum or other wholesome stabilizer. It will be considered adulterated if it contains any added poisonous or other added deleterious ingredients which may render such ice cream injurious to health; or if it consists in whole or in part of any filthy or decomposed substance which may render such ice cream injurious to health, or is otherwise so contaminated that such ice cream is injurious to health."

You would be surprised, ladies and gentlemen, if I told you the sources from which I have taken these two illustration, and I have copied them from standard high up in the industry, but for the good of the industry I will not mention the sources from which I have taken them. Why can't our definitions of standard be plain, simple, definite and brief, yet clear and comprehensive, the same as in other food products. By doing so I am sure we would incur less criticism and would enjoy the larger confidence, co-operation and support of the health officials.

More foresight and statesmanship regarding these matters has been shown by the milk dealers of the country than by the ice cream dealers: and as a result the milk dealers are enjoying better confidence and co-operation from the health authorities of the country. A very gratifying indication of the present policy of the national associations, representing both the milk dealers and the ice cream manufacturers, is the move on their part jointly to establish and maintain a national dairy research laboratory, devoted entirely to the service of these two branches of the dairy industry, with the biggest and best man the country affords at its head.

More and more each year are the several ice cream associations, both state and national, devoting large attention to the problem of improving and standardizing the quality of ice cream. One of the best means of awakening the interest of all dealers in the subject of quality is the scoring contest. Add to this the equipment exhibit and the grouping of conventions of the different branches of the dairy industry, as we are now doing, and the opportunities for benefit to every tradesman attending our conventions are so numerous as to insure success and benefit beyond question.

Operating Costs.

During the last few years it has been quite noticeable at our national conventions, and also to some extent in our state conventions, that more attention is being given to possible improvements in the technical processes of manufacture, and also to the problems of better business organization, better operating and marketing methods, better efficiency, and lower operating costs. The interest that any firm takes in all these problems is directly and definitely reflected in its system of cost accounting. Any firm that is not maintaining a complete up-to-date system of segregated unit cost accounting, covering every step in its operations, is not adequately interested in those problems, and is not abreast of the times, and is not accomplishing what it should or growing as it might. Many ice cream men do not really know their actual costs per gallon, especially their costs per gallon of selling, delivery, overhead, and depreciation. You will always find that the firm which maintains the most complete system of unit cost accounting is also the one which tenaciously maintains the most uniform and stable prices. There is more price cutting due to ignorance of real costs than to anything else. Our annual

conventions can and should do much to stimulate interest in these matters.

Business Ethics.

Another commendable undertaking of our National Association was its determination, at each of the last two conventions, to prepare and adopt a definite code of Business Ethics. This can only be interpreted to mean that there was manifest need of it in our industry, the same as in other industries; for most other trade associations have already adopted similar codes.

The ice cream and dairy supply men have adopted a very comprehensive and definite code of business ethics and fair practices. In general outline, the following are the chief points, which have been covered so far by the code of business ethics adopted by our National Ice Cream Association. These principles are regarded everywhere as sound and indispensable to the proper conduct of any line of business.

Fundamentals.

a. Tell the truth under all circumstances.

b. Do nothing secretely or under cover that you would not do openly and with the knowledge of your competitor.

c. Speak no ill of your competitor. Talk your own goods, not his.

d. Maintain uniform quality of goods and uniform prices.

Upon these fundamentals rest all the ethics of business.

By way of application of these fundamentals, the following acts are defined as unfair:

1. Any untrue statement made in any advertisement, or on any label or sign, or in any written or printed matter, or in any form of oral trade soliciting, concerning any of the materials or ingredients used by you in the manufacture of ice cream, or concerning its quality or its method or place of manufacture, or concerning the ingredients or the quality of a competitor's ice cream, or concerning a competitor's character, habits, place of business, financial standing, methods, or service.

2. Using any ingredients in the manufacture of ice cream which is not known to be wholesome.

3. Selling food, or a food product, which for any reason violates a local, state or federal ordinance, or law.

4. Secret promises, understandings, gifts, prices, discounts, commissions, rebates, bonuses, or other benefits of any kind offered to any customer of a competitor, or to any prospective new customer, or to any employe of a competitor.

5. Commercial inducements or benefits of any kind to a customer by secret, confidential, or personal rebates, by long term credits, by excessive entertaining, or otherwise, which gives one or more customers preferences that are not given to every customer under like conditions, or selling or offering to sell at less than a fair profit, or at a less price than is quoted or is given to all other customers under like conditions, or giving away of goods or supplies, or samples, in such quantities as to have the effect of rebates.

6. Trade boycotts, or combinations of ice cream manufacturers to prevent buyers from obtaining goods through customary channels, or to divide territory or allot customers.

7. Distribution of samples of a better grade than the product they are supposed to represent.

8. Inducing or attempting to induce a competitor's employe to quit his employ.

9. Procuring visitors to represent to a customer that a demand exists for a certain make of goods.

10. Threatening to sue a competitor or to put him out of business, or making threats of any kind against a competitor, or threats to withdraw advertising unless competitor's advertising is excluded, or unless certain discriminatory favors are granted, or threatening to withdraw patronage from a firm supplying material if the same materials are sold to competitors.

Competition,

One of the greatest accomplishments of trade associations during the last few years has been their stabilizing effect on trade practices and on prices. The ambition for trade expansion and sales increase is commendible, but modern business is more and more coming to realize that price cutting is more often a hindrance than a help in trade building. Any lout can cut prices, but he will find it difficult to increase or build up his business by that means. It requires quality, service and salesmanship to increase business at a sustained and uniform price. One of the best business articles I have seen of late is by Dr. Frank Crane, on "How to Handle Your Competitor." It reads as follows:

"It is a mistake to suppose that you have to fight your competitors. Nothing was ever permanently gained by fighting. For fighting of any kind is pure destruction.

"Your competitor does not have to be your enemy He can be your friend.

"Competition does not kill trade; it builds trade, stimulates trade, and makes new trade.

"This is based on the natural law that no one person can suit everybody. No man can get all the possi-

ble business in any community. His personality attracts some and repels others. Wherever there is a lot of business for one man there is business for somebody else.

"This is proved by the fact that in any big city business houses in the same line group together. We find most of the piano houses in one part of the town. Most of the automobile concerns are strung along a certain section. The silk merchants, the hat manufacturers, and so on, each have their district. This proves that in the practical working out of business it pays a man to locate in the neighborhood of his competitors.

"It is not true that there is just so much business to be had, and that a rival cuts your trade in half. As a rule the more tradesmen, the more trade. A good lively competitor will increase your custom.

"Two groceries in the same block will do more business than if there were only one, and if the other grocery is good, it is a more valuable competitor to you than a poor one.

" 'Where the carrion is there the eagles are gathered together.'

"So run the proverb. And where no eagles hover there is slim picking.

"Don't hate your competitor. Hate is always expensive. Get acquainted with him. You may learn something.

"Don't knock your competitor. It sounds bad, and it is bad. Be a good sport. Play the game. Keep good natured.

"Beat your competitor if you can, but remember that the surest way to beat him is to sell better goods and give prompter service and have more courteous work people. Don't fight by cutting prices. Keep your margin of profit fair.

"If your competitor lies about you, or uses underhand methods to harm you, don't worry. He is cutting off his nose to spite his face. He cannot fool all the people all the time. Straight business and good nature win out always in the long run.

"Your competitor will do you a great deal of good if you keep your eyes open. He will keep you from slumping. He will make you energetic, careful, more attentive to business, and altogether will be a good tonic for you, if you know how to use him.

"There is business enough for both of you. Go after it."

You are all more or less familiar with the propaganda that has been rampant throughout California during the last several years seeking to secure the adoption of a weight standard for ice cream; and you are also no doubt familiar with the way in which the issue has been met and handled. On several different occasions we have believed the question was settled in California satisfactorily to all concerned, but like the seven headed dragon by Mythology, when subdued in one place it has unexpectedly raised its head in new form in some other unexpected place.

Resolution of California Municipal League.

During the last week in September, there met in annual convention at Los Angeles, an organization of city commissions and officials known as the California Municipal League, one of the divisions of which was made up of health officers and milk inspectors. Many papers were read and much discussion had on various subjects relating to milk products. During the last hours of the convention, without any intimation that such a move was contemplated and with no representative of the ice cream industry present, a resolution was offered and unanimously adopted that the organization as a whole should request the next California Legislature to adopt a law requiring all ice cream to be sold by weight.

This incident is mentioned to show that the subject is in the air everywhere and is being frequently discussed by the retailers and by women's clubs and civic organizations in every part of the country. Our Ice Cream Trade Associations should recognize it as one of the most momentous issues now confronting the industry, and should at once formulate their plans and organize their methods of handling the issue in every state where the question may arise or become an acute issue.

Like the irrepressible conflict of old, I do not believe it will ever be settled until it is settled right. But the question—what is right—is the crux of the whole issue. The right solution is certainly not to be found in the extreme view of either side, but somewhere in between those two extremes. We have been working for years to make ice cream our national dish, and it is gratifying to observe that we are succeeding to a considerable degree. But until the industry itself can eliminate some of the evils I have pointed out, and stabilize our standards of quality and our trade practices uniformly over the whole country, I do not hope for the final solution or settlement of the weight question. We cannot deny that the public has some rights in the matter, and that it is aware of some of the abuses which we ourselves should correct.

Before closing I wish to say that I have been asked to make a statement regarding the growth of the business of the Crescent Creamery Co., and how we did it. But I think I have said enough. The only answer I can make is that we have tried in our humble way to live up to the principles here discussed as far as we could, and

"SNEAKIN' ONE OVER"

It's the unpainted tub or can that is so easy to sneak away with. The "sneaker" runs too great a risk to try it with the painted ones. Your standard color on the tub or can is certain to give him away.

For good Ice Cream Cabinets — Ask us about the Arctic Steel Ice Cream Cabinets

to be everlastingly on the job. You can judge as well as we how far we have succeeded in doing so. I thank you. (Loud applause.)

* * *

The President: We will now listen to Mr. Hosking on the subject, "Dry Storage Cabinet Trucks." Mr. Hosking, of the Peerless Ice Cream Co., Sacramento.

DRY STORAGE CABINET TRUCKS.

Address by Mr. W. A. Hosking, Peerless Ice Cream Co., Sacramento.

This is unexpected—the secretary called me up one night and said I will have to tell about Dry Storage. I don't think I should tell you about it. The Union Construction Company should tell you all about it.

Anyway, I am going to tell you what we did with regards to our two trucks—dry storage—we bought from the Anheuser Bush Company, put them to work about the first of May. Those cabinets have so far turned out very good. We carried 380 gallons of cream, five 125 pound sacks of salt and sixteen 300 pound blocks of ice. We have demonstrated to ourselves it kept our cream in fine condition. We kept one time for six days a five gallon can of strawberry cream. At the end of that time it proved to be very good, but we cannot recommend it for brick. Our costs on those wagons are very normal. We ice them every twenty-four hours, 200 pounds of ice, and about 45 or 50 pounds of salt. The ice costs about sixty cents and the salt about thirty-five.

I don't know what more to tell you about it. I think the Union Construction Company ought to do that. He can tell you more than I can. As far as the Peerless Ice Cream Company is concerned, we are very well satisfied with the dry storage system on trucks.

The President: Gentlemen, this is a very practical question, one that I know you are interested in because I have heard it mentioned frequently and I want to see some real discussion on this subject now, and there are two or three gentlemen here I think who would welcome the opportunity to have some questions asked about them.

Mr. Dreyer: I would like to ask what style of cabinet he has. From the two styles, one is the one with the brine running through the coils and the other is just an ice box on the truck?

Mr. Hosking: In this cabinet of ours, it has a brine tank above and there are two compartments, one is where the brine circulates around the coils and the coils back into the other compartment and flushes over on the brine side again.

Mr. Dreyer: I think Mr. Baird has a different style—maybe an altogether different style. It has no coils in it at all. The ice box is sufficient to hold the ice cream hard and it is a question which one of the two would be the best to use. Both are efficient. I would like to hear from Mr. Baird.

Mr. Baird: I cannot just answer that question. We have only the one truck in use at the present time and it is the system as explained by Mr. Dreyer. Knowing nothing about the system used by Mr. Hosking, I could not tell which was the best. He should try both of them out and see for himself.

Mr. Hosking: Our cabinet wagons are very good. We put the ice on top. Our brine never runs away until we let it out in the drain. Our pipes are right above our dry box above our cream.

Mr. Dreyer: What is the temperature?

Mr. Hosking: Demonstrating in May, after opening the door sixty-three times, we had temperatures when we got back to the plant between twelve and thirteen above zero. I have seen it down as low as two above.

Mr. Dreyer: You had it in about eight hours?

Mr. Hosking: We leave the plant at six o'clock, are back at lunch about 11:30 and get out again at 1:30 and get back at 3:30. In freezing these cabinet wagons, we take the cream out and defrost by turning the water in and then ice up and go around the block—two or three blocks probably. We come back and find our temperature from 42 down as low as 28. We take our cream out of the hardening room and make our bricks, and we have seen it at 9 o'clock at night 2 above zero. I am willing to answer any questions about the two wagons we have, but I believe Mr. Lindley, of the Union Construction Company, is here, and I think he will be more than pleased to tell everybody here regarding the construction of these wagons. We have two wagons of ours. At the present time we are icing every other day, 200 pounds of ice. In the summer time we ice every day, every twenty-four hours, but we go forty-eight hours now on 100 to 125 pounds of ice.

Mr. Goehler: I have the same kind as Mr. Hosking, but the brick I have to take out every night. We are saving between six and nine hundred pounds of ice a day.

Mr. Hosking: I will say about brick ice cream—they are unsatisfactory for brick cream. They are all right in the morning for a few hours. Bulk cream holds together in very good condition. Six days we had a five

Mr. Dreyer: I have been told by Mr. Lindley of the Union Construction Company that they have perfected a wagon to carry brick as well as bulk.

The President: I understand Mr. Wilson has had some experience—

Mr. Hosking: Mr. Wilson has two or three and Mr. Christopher has a cracker-jack.

The President: Mr. Wilson is called first. We will hear from him.

Mr. Wilson: The trucks that we have have worked out very successfully, in fact, Mr. Hosking copied all his ideas from our truck (laughter). He made a trip down there, looked ours over and built some just like it. We have both types, one, the first truck we purchased was the "A B C" type, and later we built in our own shop three of the Meyer's type of truck. That is, following out the Meyer plan as nearly as possible from looking at their catalogues and illustrations. That type simply consists of building a box with two compartments, one for ice and the other for ice cream. It is a body on a gasoline truck. We have also one on an electric truck. We use about four inches of cork with an inch of redwood on each side of the cork. We simply build a tank in the top of the ice cream compartment about eleven inches in depth connecting a quarter-inch pipe coil over that tank, bringing the brine down through those coils, down on one side and take it across and up on the other side and out. We found considerable complaint this summer from the new commissioner of public works in Fresno that we were allowing brine to drop on the pavements, so we put a valve on the end of the drip pipe, and gave our driver instructions to draw out some brine every hour or two whenever it was convenient. We found it worked perfectly and never had any trouble at all. Our trucks come in about three in the afternoon. The driver loads his ice cream for the next day and never touches—after recharging the ice compartment—he never touches that again until he gets in the next day at 3 o'clock in the afternoon.

The President: How does your ice consumption compare with the figures given by Mr. Hosking?

Mr. Wilson: We use practically about that amount of ice that he mentioned. From six to nine hundred pounds of ice a day. That is the minimum. Under the old method of re-icing and packing the cream in ice and salt—

The President: Did I understand you to say your bodies use from six to nine hundred pounds of ice?

Mr. Wilson: No, our bodies used 125 pounds of ice a day and 30 pounds of salt. We are running our Meyer body with 125 to 150 pounds of ice a day and 30 to 40 pounds of salt.

The President: Are those Meyer features patented?

Mr. Wilson: No, no patents except simply a brine tank on the top with a coil and drip running out of the bottom.

The President: Is the A B C patented?

Mr. Wilson: The A B C is patented and if you use it you will have to pay a royalty. We have found one feature about our trucks that is very vital and that is the partition in the center of the ice cream compartment with a door on each side of the truck so that in opening the door we do not let in all of the warm air. We save half of it. We do not admit heat into the entire compartment but just one side of it at the time and we think that is a benefit. I might also add that we are now rebuilding all of our old style bodies and we are going to try and experiment. We are going to try and get along without coils, just the tank in the top and see if that gives enough refrigeration.

Mr. Hosking: We have two doors on each side which makes four doors and we get along very nicely.

Mr. K. L. Carver: Mr. Chapman is here and he can explain it.

The President: Glad to hear from Mr. Chapman.

Mr. Chapman: Mr. President, Gentlemen, we have at the present time one A B C refrigerator body. It takes about 200 pounds of ice, as Mr. Hosking has said, about the same amount of salt, but when our truck turns in at night we do not re-ice. We load in the morning and charge it with ice in the morning. In the evening we drain the brine off and put it in the garage and then re-charge in the morning as we load the cream so we have had no trouble with our brick up to this time. The brick is kept in very good shape and certainly our tests have run up about six above zero. That is what it averaged all last summer.

Mr. C. O. Swanberg: Are the cans just put right in as usual?

Mr. Chapman: The cans are put in as usual but with no ice. The ice is above.

Mr. Swanberg: And then you take these cans and carry them in to the customers?

Mr. Chapman: In to the customers, perfectly dry and clean.

Mr. Swanberg: Then you put them down on ice in the customer's cabinet?

Mr. Chapman: Yes.

Mr. Swanberg: Thank you.

The President: Mr. Alfred's name was mentioned. Mr. Alfred, have you had some experience?

Mr. Alfred: Some. We only had a very small body.

FOR A

Smoother, Firmer Ice Cream
Fruit Frost or Water Ice

USE

Rippey's Powdered Foamoline

No Heat Required

Simply mix Rippey's Powdered Foamoline with the dry sugar add your cream or milk and it is ready for the freezer.

Send for a trial package and book of formulas.

For a limited time we will send postpaid a full half pound package on receipt of 25c, together with our formulas for making ice creams, sherbets, etc.

Rippey's Powdered Foamoline is packed in one pound boxes with registered trade-mark and signature of William Rippey on every box. Never sold in bulk.

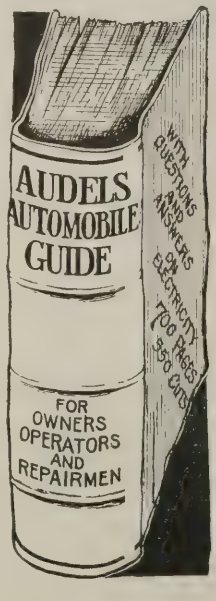
I think it was too small. It did not give good satisfaction. However, I have paid for the bodies and ordered more, the A B C. I cannot say anything more now until next season.

Mr. Hosking: Mr. Chambers might give you a little idea about his.



Mr. Chambers: Mr. Crane, who has been there some time, can give you a better one.

Mr. Crane: It is a little unexpected to say a word about this. I will say this much that the question of refrigeration has not been very satisfactory because it was built under circumstances that were not good. Our manager took an idea after looking at the A. B. C. and everything else like that and it did not quite come up to expectations. Well, we found, I think, that things are going to come better for us—at least we hope to have them that way—we are going to change that system because with our system it keeps dripping on the street all the time, dripping out of the cabinet wagons, and we do not hold the temperature enough. I think if we can keep that circulation going all the time—there is one thing I have noticed in my observation, it has been that if we could get a little pump pumping the brine some way to keep forcing it through, your refrigeration would be a lot better. I think that is more important than anything else when it comes right down to refrigeration, if yau can get that circulation keeping going all the time. Of course, as I say, it is unexpected on my part and I cannot tell you much more than that, but I thank you just the same.

Mr. Hughes: Mr. Wilson, in rebuilding the tubs do you put cork on the outside?

Mr. Wilson: The old trucks have two inches of cork and they are covered with sheet iron.

The President: Any further discussion of this subject before we leave it? None.

The next order on the program of the afternoon is the appointment of standing committees. It is usually done early in the convention to give opportunity of doing committee work that might be wanted during the convention.

The first committee I will name will be the committee along the line of what Mr. Green had to say, a committee of the ice cream industry to co-operate with other like committees of other branches of the dairy industry to handle the next year's dairy show, and in matters that need attention or handling in connection with this dairy show the remaining days of the week. On a committee of three I will name:

D. M. Dorman, Los Angeles; A. S. Goode, Bakersfield; L. W. Wilson, Fresno.

The committee on legislation: Robert J. Dryden, Chairman; F. E. Miller, L. W. Wilson, Harry Peacock, Larry Hughes.

The committee on quality and standards: Prof. G. D. Turnbow, Chairman; T. E. Chapman, C. J. Alfred, Geo. H. Ball, R. J. Dryden.

The committee on sales promotion. It seems that there should be a good deal of educational work along lines of that character: K. L. Carver, Chairman; J. H. Seba, W. T. Valberg, Geo. H. Platt, W. B. Hage.

The committee on business ethics: C. J. Alfred, Chairman; Harry Peacock, Mr. Sperry, C. F. Heil, D. M. Dorman.

The auditing committee: Mr. Chapman, Mr. Wilson, Mr. Hightower.

* * *

The President: I would like to extend to Mrs. Miller an opportunity to say a few words. We have a little spare time this afternoon.

"SHALL THE 'SILENT PARTNER' KEEP SILENCE?"

Address by Mrs. F. E. Miller, Oakland.

Mrs. Miller: Mr. President, Gentlemen and Ladies, I have been looking that program over pretty carefully and I have not seen my name on that and I cannot understand why I should be called, but this year I have been making with my daughter a few talks on milk and ice cream in Oakland, and Mr. Dunne, the president of the Pacific Northwest Association was in San Francisco when some one handed him a paper with my name on it. He met my husband at the Palace hotel and he told him—he says, "I would like for you to tell your wife that she is going to be asked to speak at the convention in Seattle." He did not ask me, he just asked my husband. My husband came home and undressed, got ready for bed, and just as he went to turn the light out he told me I was to be on the program. I did not sleep any for several nights because I am not accustomed to address conventions, but probably I can say something this afternoon of the same talk I gave up there.

(Mrs. Miller's address was published in connection with Pacific Ice Cream Manufacturers Association Proceedings, Page 114, April, 1922, issue.)

* * *

Mr. Swanberg: Ladies and gentlemen, having such a partner, or call it silent partner, as Mr. Miller has, I think that he is invincible. I thank you for listening. That is my opinion.

The President: Mr. Dreyer, who is on the program for tomorrow, is with us this afternoon, and as the program for tomorrow is pretty full, and we have several

A Contract for Foil Wrappers is Protection

WITH the coming of warm weather the demand for chocolate coated ice cream pie grows daily. You may not know at this moment whether you will need 50,000 wrappers or 500,000—but the way to be perfectly safe is to protect your supply by placing contract with us for Master Metal foil wrappers.

When hundreds of purchasing agents start scouring for foil wrappers, as they may have to do, some will not get the quick service they are sure of today. Contract customers of the U. S. Foil Co. will have first consideration and will not be embarrassed by delays.

We can design, print and ship to you quickly the most attractive foil wrappers on the market. Samples sent on request.

vacancies—minus numbers—on today's program, we will call on Mr. Dreyer to present his paper this afternoon instead of tomorrow.

"HARDENING ICE CREAM."
Address by William Dreyer, Visalia.

Mr. Dreyer: Ladies and gentlemen, it is rather short notice that I get to give my talk, but I have it all down on paper. My wife tells me that the important thing is to make my paper short. A talk to be made at a convention should be like a lady's dress, "long enough to cover the subject, and short enough to be interesting!"

I heard a man speak before a convention once who was pretty good. He said, "I don't know what to talk about, ladies and gentlemen," so one man says, "Speak about a minute, pretty soon we will have them all going." He spoke a minute and sent me a-going out of the door, so I have tried to make my paper short, and hope you will appreciate it in the spirit in which it is given.

Sometime ago I received a letter from our worthy secretary, Mr. R. J. Dryden, stating that he had chosen for me the subject of "Hardening Ice Cream."

In order to speak upon this subject I must necessarily go into the art of refrigeration; because refrigeration has a direct relation to the hardening of ice cream.

An ice or refrigerating machine is simply an ingenious contrivance for the transference of heat from one object to another. In our ice cream business, for instance, the heat of the ice cream to be frozen, is transferred to the water of the condensing coils.

Anhydrous ammonia is the medium by which this transference is affected. Ammonia boils at a temperature of 28 6-10 degrees below zero, at atmospheric pressure. By reason of its low boiling point, it is used as the absorbent of heat, and the heat thus taken from the ice cream and storage room is transferred to the ammonia (the latter having become vaporized by the heat absorbed from the ice cream), is compressed and conducted to the condensing coils. Here, its excess heat is transferred to the cooling water of the coils, and the ammonia, having been robbed of its heat is thereby liquified, going to the receiver; and then, is again sent on its journey to take up more heat from the ice cream and again have this transferred to the water of the condensor. In this manner the desired temperature in the hardening room is obtained, which, I think, should be 5 degrees below zero, for ice cream.

Having produced such low temperature, it behooves us to imprison it, and therefore construct ice boxes with sufficient cork insulation to stop any heat from stealing in, or from cooling the ground on which the storage room is built.

Insulation is an investment for which the returns should be based on the savings affected by the lower operating cost. Heat will always rise to the top. The lowest temperature is on the floor of the hardening room, and for this reason the large size cans should be on the lower section, also the bricks, unless there is a special space (with coils just far enough apart to allow a brick pan to slide in between) prepared for them.

There are various systems of hardening rooms, namely:

The still air.

Air circulation, or blast system.

Bunker system.

I presume we all know them, but I would like to tell you about a system installed in an ice cream factory in Portland. They have the bunker type of hardening room, over each set of coils they have a spray coil; when defrosting they just turn on the calcium brine, allow it to run over the coils, catch the brine in a large pan and while defrosting, cool the room at the same time.

It is very necessary to maintain a uniform temperature in the hardening room.

Ice cream which has to withstand an uneven temperature cannot be good. It loses its body and texture rapidly. The quicker it is frozen the better body and texture, for slow hardening allows ice crystals to form. Invert sugar corn syrup and thorough pasteurization are found effective in preventing crystalization and sandiness, and should be beneficial, especially where you have to work with higher temperatures.

Five-gallon can should be frozen hard in 12 hours.

Three-gallon can in 10 hours.

Two-gallon can in 8 hours.

The matter of coloring ice cream is a serious one, as during the hardening it darkens considerably. Deep colors are objectionable. Loganberry, raspberry, and grape juice ice cream should be kept in small quantities only, as they will turn to a bluish purple as they grow old, presumably by the action of the fruit acid against the tin.

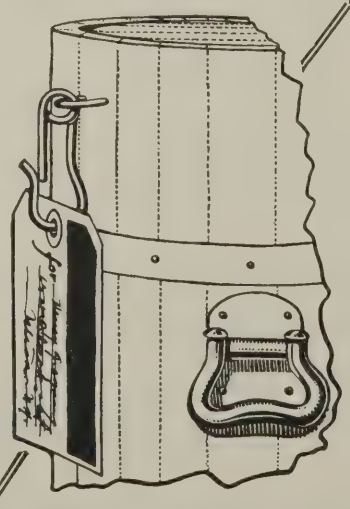
Ice cream loses its first flavor after a week's stand.

I would recommend to date each freeze. I, for instance, date the can tops with colored chalk, indicating the flavor at the same time.

White chalk date indicates vanilla, red, strawberry, brown for chocolate, orange for orange, and tan chalk indicates maple nut.

All specials are dated with white chalk, the flavor indicated by a printed paper slip lying clamped between lid and parchment circle. The cans are then set on the shelves according to date, one following the other.

Just a word on sliced bricks. I find that wrapping a two-gallon pan of sliced bricks at one operation is not



TAG HOOKS
Save Dollars

Why use expensive, untidy, time-losing strings or wires while tagging your tubs or pails of ice cream?

SNAP 'EM ON
and use our rust-proof tag hooks.

SAVE TIME—Figure the cost of strings or wires. Then think of the value of a man's time while tying the tags on your tubs.

PACKAGING MACHINES HAVE REVOLUTIONIZED THE PACKAGE ICE CREAM BUSINESS.

efficient as the slices soften easily and are often pressed out of shape when put in the boxes. I slice and wrap them—put the slices on boards and return them to the storage room to harden. Later, upon packing them in the boxes, I have a better looking brick with nice sharp edges. Bricks taken out of a storage room at a temperature of 5 degrees below zero should keep hard one hour.

In conclusion, I wish to say that I have been delighted to have the honor of speaking before such a distinguished gathering and sincerely hope that my little address be accepted in the spirit it is given, namely: To help make ice cream better. I thank you.

* * *

The President: We have time for some discussion of this paper while the speaker remains in front to answer questions. This is a very important practical subject in connection with the industry. If any one has any questions to ask or any discussion, let us have it.

Mr. Swanberg: Have you practiced at the Acme what you have preached here?

Mr. Dreyer: Quite a little.

Mr. Swanberg: Thank you very much. I thought possibly you might not have done so.

Mr. Dreyer: I always practice what I preach.

The President: I would like also to mention, or request, rather, any member who would like to hear any discussion or like to see consideration given to any question, or any phase of the business, if it is not on the program, don't forget, just make a little note of it and pass it into the secretary between now and tomorrow noon, or early afternoon previous to the time indicated on the program for the round table, beginning at 2:30 tomorrow afternoon. We usually get as much good out of the round table hour, or two hours, as we get out of the whole convention besides, because it is purely informal. We just sit down together in a sort of family circle with no formality of the convention, to take up matters of practical interest and concern, and where we can have an informal family talk. This round table is limited to active members only and we usually enjoy a quiet couple of hours and can talk some of the inside things of our business in a way that our members generally feel with more freedom than if it was a long public meeting. At any rate we have often experienced that we get more real good out of the one or two hours of the round table portion of the exercise than we get out of the whole convention. If any of you think of any subject you would like to hear discussed, and would like to get the views of anyone else just make a note of it on a slip of paper and pass it into the secretary between now and 2 o'clock tomorrow afternoon.

We have finished the regular program of the afternoon but before we adjourn, I want to give an opportunity if there is anything special that anyone wishes to bring up, we have still a little time and there is no order of exercises that will stand in the way of taking up any subject if anyone has anything to propose.

Are there any announcements that the supply men would like to make regarding their functions and activities and so forth. I do not know what "and so forth" means, but if so, maybe they had better make that announcement.

Is Charlie Lee in the room?

Mr. Lee: I haven't anything to say. I think everything is all set for a good time. Those who haven't their tickets should get them. I believe everybody has been taken care of.

Dinner will be served at 7 o'clock and the show starts at 8:00, and as far as I learn so far there is going to be no closing time. Everything is to be held here in the hotel downstairs. That is all I have to say.

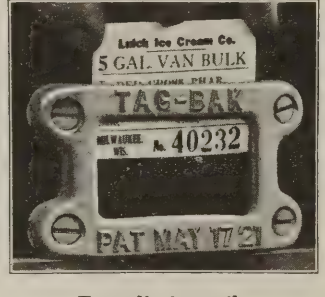
Mr. Dryden: The supply men are giving this. It is all free at 7 o'clock in the main banquet room. There is going to be a dance and that is about as far as they will talk.

Mr. Swanberg: When will the dance commence.

Mr. Dryden: When they eat, 7 o'clock, it is a complimentary entertainment on the part of the supply men to the manufacturers. They have planned a mighty fine program from what I can hear.

The President: Don't confuse the banquet this evening with the banquet that the association is to give tomorrow evening. They will both be banquets but they will be different; and the association is being entertained this evening. The association will be giving the banquet tomorrow to all its members, associate, active and all.

Mr. Dryden: The difference will be three dollars.



The President: If there are no further announcements we will stand adjourned until tomorrow morning at 9 o'clock.

Adjourned at 4:30 P. M.

* * *

Monday Evening.

On Monday evening the supply men acted as hosts and entertained the visitors and members in attendance. Mr. A. C. Baldemann, Maugus Fruit Products Co., San Francisco, acted as toastmaster during the banquet, which was held in the main dining hall of Hotel Stockton. The cabaret supper and dance proved to be a jolly good time. A three-act vaudeville was very interesting and several songs were indulged in, some of them being composed for the occasion. The gathering

What They Sang.

Tune of "Jada."

Father, father, take a brick home every day
You'd better, you'd better, or there sure'll be hell to pay;
Sister will be waiting, mother, too,
Baby will be crying, and they'll blame it all on you;
So father, father, take a brick home every day.

Tune of "Liza Jane."

I gotta girl an' you got none—
I bought ice cream;
I gotta a girl an' you got none—
She eats ice cream.
Oh, get wiser ! Buy her ice cream!
Oh, get wiser ! Buy her ice cream!
Some like a dish, some like a cone—
So it's ice cream.
When you get home, step to the phone,
Whisper, ice cream.
Oh, get wiser! Buy her ice cream!
Oh, get wiser! Buy her ice cream!

Tune of "Over There."

Here or there ! Here or there!
They will scream for ice cream, here or there!
Oh, the girls all eat it; the boys all beat it
To soda fountains everywhere.
Grease your hubs; fill your tubs;
Don't make room for the gloom or the dubs.
While chicks are roosting, just keep on a-boosting,
And we'll sell ice cream when it's snowing
Here or there

Tune of "Let the Rest of the World Go By."

They've prohibition, too,
In Stockton by the slough;
We'd like to leave it all behind
And go and find
A place that's new
For us alone,
Just a place to brew our own,
We'll boil up the hops
Far away from the cops;
W. C. T. U., good-bye;
We'll build a little still
Up yonder in the hill
And let the rest of the world go dry.

Pacific Coast Yell.

Are we right? Are we right?
Ice cream men are always right.
Are we right? Well I should smile,
We've been right for a hell of a while.

Tune of "Smiles."

There's ice cream that makes us happy,
There's ice cream that makes us blue,
There's ice cream that's made for "cut price" buyers
Just to "shave the cost" a cent or two,
There's ice cream that's peddled by the gallon,
There's ice cream that's sold in war taxed cones;
But the cream they make in California
Is the cream that goes to our homes.

Tune of "Tramp, Tramp, the Boys Are Marching."

Pack, pack, pack your tubs with ice cream,
Enough to last a season through,
And let prohibition be dammed,
While your pocketbooks are jammed,
In the summer time of 1922.

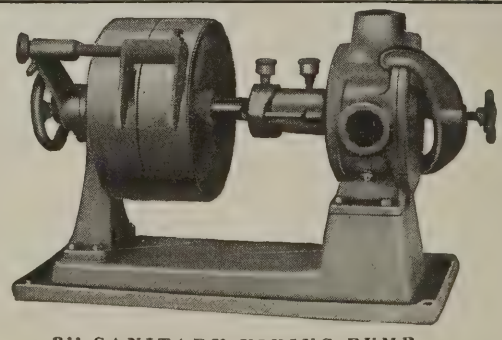
Tune of "On Trail of a Lonesome Pine."

Oh, the gang's come to Central California,
On the banks of the Stockton slough,
Where the cows are seen, in grass that's green,
Giving lots of cream for me and you;
Oh, soon, in the month of June,
Our tubs we'll fill by the light of the moon;
If we all join hands in Stockton's balmy clime,
We'll give them hell in the summertime.

Tune of "In the Shade of an Old Apple Tree."

In the shade of an old battle tree,
It's a freezer of "Gloria" for me;
With Wilson and Ames
And two or three games,
Ain't we got fun? Oh, gee!
There'll be Christopher and Miller and the bunch
To join us in eating the lunch;
And to end up just right,
We won't quarrel or fight
In the shade of the old battle tree.

Tune of "Where Do We Go From Here."



Ice cream, ice cream, where do you go from here?
Where e're you roam, in every home,
You'll find it, never fear.
Just boost like hell—'twill kill the smell
Of jackass booze and beer.
Ice cream, ice cream, we know where you'll go from here.

Tune of "My Sunny California."

There is cream that they dream of in Chicago,
There is cream that they dream of in Maine,
There are cones and brick galore
To be found from shore to shore;
Sure, they feed it to the matadors in Spain.
There are cones that they feed to the baby,
There are bricks that they feed to dad,
But the cream of all ice cream
That will make the whole world beam
Is made in Sunny California.

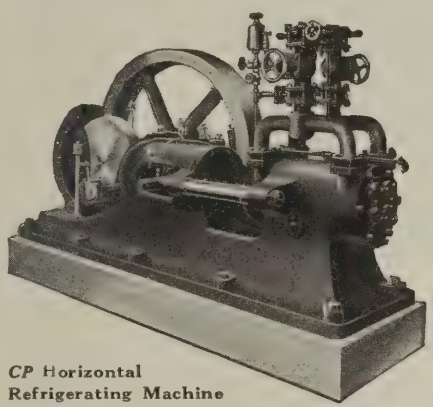
CP Mechanical Refrigeration



The Modern Method of Maintaining Uniform Temperature

For Ice Cream Freezing, Hardening and Storage

IN NO other field does ***CP*** Mechanical Refrigeration prove more valuable. It is more economical than natural ice for it requires less space and fewer men about the plant. Ice can be made on the premises with the ***CP*** System for icing tubs, cabinets, etc., at very low cost.

The ***CP*** Mechanical Refrigeration plant is strictly sanitary as dirt is confined to the boiler room and slop to the wash room away from the rooms where cream is frozen, hardened and stored.

CP Horizontal Refrigerating Machine

CP Refrigerating Systems can be supplied in all sizes ranging from ¾-ton up with either horizontal or vertical compressors and driven by belt, direct motor drive or direct Corliss engine drive as desired. Send for free ***CP*** Refrigerating Machine catalogue.

Tune of "My Old Kentucky Home."

The sun shines bright in the middle of the street,
'Tis summer, the family is gay,
For dad is in the cellar, the drys he's going to cheat
With the hops that he's gathered all the day.
The neighbors roll on the little parlor floor,
All merry, all happy and bright;
By'n bye comes a cop—a knocking at the door;
Then my little old home brew—good-night!

CHORUS.

Weep no more, my baby, oh, weap no more alone;
We will see you through, tho' you've lost your old home brew,
Dad will bring you home an ice cream cone.

NUTS TO THE NUTTY.

The old lady wished to buy some pecans, the clerks were all busy and paid absolutely no attention. Finally she could stand it no longer:

"Well, I must say this is a fine kind of a store. Isn't there anyone around here to wait on the nuts?"

—Inklings.

FREDERICK C. MATHEWS ORGANIZATION EXPANDING.

Frederick C. Mathews Company, Detroit, announce as an addition to their organization, J. W. T. Knox, well known sales and advertising authority, who has resigned and concluded his interests with the firm of Nelson, Baker & Company to join the Mathews organization.

J. W. T. KNOX.

Mr. Knox, an early president of the Adcraft Club, has for the past ten years acted as Sales Promotion Manager for Nelson-Baker in their marketing of the Penslar line, and guided Penslar advertising as well.

His wide knowledge of the retail trade is to be utilized in the interests of Frederick C. Mathews' clients in rounding out their organization group, which now includes Dr. H. A. Harding, C. W. Esmond, A. R. Fernald, C. H. Arnold, H. H. McIntyre, J. T. Alton and other authorities well known in the field, all of whom are devoting their entire time and energies to Mathews' plans.

$100,000 CREAMERY MERGER.

The Wells-Chief Creamery Company, a $100,000 corporation, has been formed as a result of the consolidation of the C. O. Wells Creamery Company of Crestline, Ohio, and the Wells Dairy Company of Upper Sandusky. This consolidated company will be operated without a change in management or personnel of stockholders. The consolidation will result in a more efficient organization, with the advantages that come as a result of conducting the business as one company.

The purchasing and selling departments will be located at the home office, which will be at Upper Sandusky.

Send news items and personal notices to the "Review" and see how well they look in print.

ANNOUNCEMENT

ICE CREAM MIX

from us

READY TO FREEZE

Write for prices

PERRY PACKING CO. Perry, Iowa

At present low prices for retinning Ice Cream Cans you can make a very decided savings over the purchase of new cans.

Take advantage of this service, have your rusty cans retinned instead of junking them and buying new cans.

Our price for retinning a five gallon Ice Cream Can is seventy-five cents and ten cents for Covers—about one third the cost of a new can.

Use your old crates in shipping us your rusty cans. Just mark your tags—

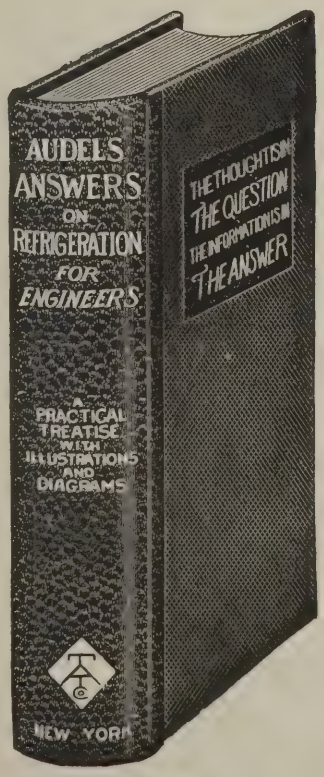
MANITOWOC PLATING WORKS

MANITOWOC, WIS.

We will do a most satisfactory job and get your cans back to you promptly.

FLAVOR YOUR ICE CREAM WITH

Cremilla



"CREMILLA" is better, smoother, creamier and of richer flavor than the finest grade of pure vanilla; and it's more economical.

"CREMILLA" is so concentrated as to make it the best flavor to use with homogenized cream; one-third to one-half oz. flavors perfectly 10 gallons of cream (one to one and a half pints for 500 gallons.)

Trial gallon by express on request. After fair trial, if you don't like it, send back what's left and pay us nothing.

SELECT QUALITY FOR SERVICEABILITY IN TUB COVERS.

PACIFIC ASSOCIATION OF ICE CREAM MANUFACTURERS.

(Continued from page 46)

Now, if compound or imitation of pure vanilla flavor are so good, why is it in all the years that vanilla extract has been manufactured, there is not a national sole brand of imitation or compound vanillas in the United States? You can find pure vanillas from Rockland, Maine, to San Diego, California. You can find pure vanillas from Bellingham, Washington, to Key West, Florida. In other words, pure extracts are nationally sold.

All manufacturers of flavors today are manufacturing imitation and compound extract. Why do they do it? To take care of an insistent demand, but there is no imitation that was ever manufactured that will bring repeat business that pure vanilla will as a silent salesman in ice cream.

People will tell you that pure vanilla will freeze up. If you have enough pure vanilla in your batch it won't freeze out. You don't send a five-year-old boy to bring a ten-gallon freezer of ice cream—you send a man after it. You don't ask a one-ton truck to carry five tons. Therefore, when you are making pure vanilla ice cream, put enough pure vanilla in it. Bakers will tell you pure vanilla will bake out; yet we have manufacturers of crackers and biscuits who make exclusively dry doughs, who are using pure vanilla. If they can't bake it out, how are you going to freeze at out? Some people will tell you the vanillin in a pure vanilla will crystallize. If vanillin from pure vanilla will crystallize, get some one to explain to you, and I want to hear it, what keeps chemical vanillin from crystallizing.

Taking into consideration a formula for making ice cream, I have found that invariably no matter whether a concern is using 20 per cent cream, whether they are using an excessive amount of gelatine, an increased amount of condensed or dry milk, you will find formulas reading about the same when it comes to that silent salesman flavor. Honest, they never give him a chance. I was going over a number of formulas the other day for making ice cream, and although they changed every formula, increased the total amount of solids to be flavored, still that poor silent flavor stayed at 4 oz. for every batch.

(To be continucd in June issue)

BRANCH PLANT AT HARLAN, KENTUCKY.

The Middlesboro Creamery Company of Middlesboro, Ky., recently begun operations in their branch plant at Harlan, Ky. This is a new modern plant and was constructed and epuipped at a cost of about $30,000 It has a capacity of 500 gallons of ice cream per day. The buiding is a frame structure which is to be brick veneered. The floors are all of six- inch concrete. The plant is using electric power, but has a steam engine installed and can change to steam very quickly in case of emergency. The hardening room has a capacity of 1000 gallons of ice cream and is kept at a temperature of about 20 degrees below zero.. Two wagons and an automobile truck are used for delivering.

The ice cream mix is made at Middlesboro and shipped to the Harlan plant; it is, however, pasteurized at the Harlan plant before being frozen and later it is expected that the mix will be made in the plant. The plant manufacturers "Quality" ice cream and "Sweet Bite" chocolate coated bars. They will also sell ice which likewise comes from the Middlesboro plant.

M. H. Thompson, a very successful man in the ice cream business, is general manager of both plants; W. C. Bowers is manager of the new Harlan plant, and A. L. Parish, of Decatur, Ala., who has had eleven years as an ice cream maker, is maker in both plants.

Above is a picture of the Sapulpa Ice Cream Company, Sapulpa, Okla., one of the most convenient and up-to-the-minute plants in the southwest. Mr. L. K. Jones, a hustler, a firm believer in advertising, and a man who sells all the Eskimo Pies he can produce, is manager of this plant.

M. & G. ICE CREAM COMPANY ERECTS SERVICE STATION.

The M. & G. Ice Cream Company of Allentown, Pa., are erecting a service station at Wilkes-Barre. Several freezers have been installed, and a hardening room has been erected which will hold 20,000 gallons of ice cream. The mix will be shipped from the new Allentown plant, and frozen at Wilkes-Barre, to be distributed in that city and Scranton.

This is the third service station this company has erected this year, in addition to building the half million dollar plant at Allentown.

The directors of this company are John G. Mealy, H. H. Farr, Carl D. Bauer, Fred J. Weaver, Joseph F. Gorman, John I. Goade, George LeRoy Walker, Oscar G. Tallman, Jacob Maurer and John A. Nallin. Mr. Mealy is in charge of the development of the business.

PROFESSOR LOCKWOOD IS PERMANENT SECRETARY.

Prof. W. P. B. Lockwood, of the New England Dairy & Food Council, has been named permanent Secretary for the New England Association of Ice Cream Manufacturers. Headquarters have been established in Room 401, 51-Cornhill, Boston, Mass.

Professor Lockwood is going to give a great deal of his time to this work and assures the New England Association and their members that they are going to get full value out of their membership in the New England Association.

PERSONAL.

Mr. R. G. Martin, representing the Elite Chocolate Coated Baseball Company, El Paso, Texas, called at the Review Office a short time ago. Mr. Martin explained a system by which they are going to give away some baseballs bearing the signature, Babe Ruth. See their advertisement in the next issue for details.

DEPRECIATION.

By Benjamin Levitas, Public Accountant, New York City.

In common with other manufacturers, ice cream concerns are giving closer attention to costs. As it has been pointed out in these columns, the wear and tear depreciation on machinery, delivery equipment and buildings forms an important part of the total cost of a gallon of ice cream.

In a recent issue, it was suggested by one who has completely studied the matter, that the proper depreciation rate for buildings used in this business is 7%. As a public accountant connected with the ice cream business, I gave this some thought, after it was brought to my attention.

In supporting a 7% rate, it was stated that an ice cream building because of its construction, would have to be disposed of at a sacrifice, should it become necessary to sell. If, however, the selling price of assets is to be considered, it would be necessary to charge off about 33% on all machinery the first year.

The fact that it is difficult to sell buildings and equipment used in ice cream manufacturing, makes it a risky business. Therefore, the profits should be larger than in a more staple business, where the possibilities of loss are smaller. Possible large losses because of the specialized nature of the business, should be compensated by a larger percentage of profit, after actual depreciation has been taken. Depreciation is however, and must be treated as, a real cost item, and not as a reserve for contingencies. Some allowance for obsolescence should be included with depreciation, to provide for the replacement of assets in good running condition, whose continued operation is no longer desirable, because of more rapid and labor saving improvements that have come on the market.

Depreciation is figured as a going concern, on the basis of how long the asset will last, and not on how much it will bring, if sold because of some necessity. A building and lot may sometimes bring more than their cost after long use, but this does not affect depreciation. The changes due to market conditions have nothing to do with depreciation, which is based entirely on the original cost.

Certain very unfavorable and destructive conditions make depreciation on ice cream buildings high. Since these do not affect a separate structure as a garage or stable, the rate on these will ordinarily be lower than 7%. The rate varies with the construction.

Each concern must decide for itself, after considering the experience of others, what the proper depreciation rates are in its individual case.

CRESCENT CREAMERY OPENS ICE CREAM DEPARTMENT.

An ice cream department with a capacity of 1,200 gallons a day has been opened in their new plant by the Crescent Ice Cream Company, of Sioux Falls, South Dakota. This new plant is modern in every respect, and equipped with the latest types of machinery.

This company is co-operating with the dealers by putting on a campaign to help them sell more ice cream. In addition to other publicity, dealers are supplied with tempting display material such as illustrated posters and hangers to attract people to the store.

Chocolate coated ice cream bars are also manufactured by this company.

That's the One!

Ask any ice cream plant employee who has ever worn and worked in an Akron Heavy-Service Rubber Apron and note how quickly he will reply, "that's the one you will like the best and be most satisfied with."

Akron Apron & Rubber Sales Co.
20 E. Miller Avenue Akron, Ohio

ASHTABULA, OHIO, HAS NEW ICE CREAM MANUFACTURER.

The completion of the new plant of the Ashtabula Pure Milk Company, at Ashtabula, Ohio, gives that city one of the most complete and finest creamery plants in that section of the state. The plant is fully outfitted with the very latest type of equipment, built especially with a view to creating absolutely sanitary conditions, with resultant purity of the product.

Construction of the new building was started last fall. The flooring throughout all the departments is of special construction. A red finish has been laid over the concrete flooring, which will make it impossible for greases and fats to accumulate in the crevices on the floor. Every precaution has been taken in the construction of the new plant to insure cleanliness.

One of the best and most modern additions which have been made to the plant is the ice cream manufacturing department. This department is thoroughly equipped with the most modern machinery known to the trade. Arthur Shaw, who has had several years' experience in the manufacture of ice cream, is in charge of the department. The ice cream made at the plant will be known as "Reynold's Ice Cream."

The plant is equipped with an ice machine which has a daily capacity of 22 tons of ice. The refrigeration room is kept at a constant temperature of 35 degrees, and the chocolate coated ice cream bar department is located in this room. The hardening room, which has a capacity of 1,200 gallons of ice cream, is kept at a temperature ranging as low as 14 degrees below zero. All of the rooms which are constantly kept at low temperatures, and also the ice freezing tank, are insulated with cork.

Charles J. Reynolds, who is the sole proprietor of the business, bought out Frank Eastman, June 1, 1921. Previous to coming to Ashtabula, Mr. Reynolds had seven years of valuable experience as owner of the largest independent milk distributing business in Erie, Pa.

SPARTAN CREAMERY EQUIPS MODERN PLANT.

The Spartan Creamery, located at Spartanburg, S. C., has recently installed a modern plant for the purpose of handling market milk, butter and ice cream. The plant has a 10-ton refrigeration capacity, is equipped to handle an unlimited supply of market milk, and can make 750 gallons of ice cream a day.

Experts have agreed that this plant is one of the most up-to-date plants in the South. Mr. W. J. Nickles is the president and general manager, and has the hearty co-operation of the local Chamber of Commerce in building up a dairy business to "beat the boll weevil."

STUDENTS' DAIRY PRODUCTS JUDGING CONTEST.

At the National Dairy Show this fall there will be held a contest for the judging of Dairy products for students enrolled in Agricultural colleges.

A gold medal awarded by the International Milk Dealers' Association will be given to the student doing the best work in the judging of Milk. A gold medal by the American Creamery Butter Manufacture Association will be given to the man doing the best work in butter. A gold medal by the J. L. Kraft Brothers Company will be given for the man doing the best work in cheese. The National Dairy Show will give a silver medal for the second highest man in each class and a bronze medal for the third highest man in each class. The National Dairy Show will also give a gold medal for the man having the highest average in all classes.

The team doing the best work in milk will receive a cup to be held for one year donated by the J. B. Ford Company. The team doing the best work in butter will receive a cup donated by the J. G. Cherry Company to be held for one year and the team doing the best work in cheese will receive a cup to be held for one year donated by the Hoards Dairyman.

Rules governing this contest have been changed materially from those governing it in the past, and copies can be had by writing Professor J. H. Frandsen, Lincoln, Neb.

A COMBINATION BRICK-BAR CABINET.

Because of the possibility that an interchangeable cabinet may be required, the Brooks Cabinet Company, of Norfolk, Virginia, is making a "Counter Cabinet" which serves to hold either chocolate coated or brick ice cream.

This new design in ice cream cabinets can be placed on a soda counter or a stand or any convenient place, or can be taken to fairs or entertainments. It will hold either chocolate coated or brick cream, or both, at the same time. The cabinet is made in a white enamel finish and with a galvanized iron container that has a tapering top to allow complete icing and a false bottom to prevent moisture. It has a pure cork board insulation and all of the features which have gained for Brooks' Cabinets an enviable reputation for refrigerating qualities and durability.

The addition of the "Counter Cabinet" to the tub, metal lined, brick and combination cabinets makes the Brooks assortment complete.

VANILLA IN THE MIX

STANDARD VANILLA AND BLENDS

IN many ways flavor is perhaps the most important component of the mix. Without it the mix is flat and makes no appeal to the senses. Even the least discerning person will readily detect the want of it. Objectionable milk flavors may go unnoticed—but the lack of added flavor brings a flood of protest.

The average person is so readily attracted by an excellent flavor that the Vanilla used often establishes the popularity of the product. There is no golden rule to follow in the selection of the proper Vanilla Flavor. The taste requirement of your patronage, your personal choice on a basis of quality, economy and confidence in the manufacturer and his product point the way.

STANDARD VANILLA AND BLENDS

May we assist you in the selection of your flavor through our field representatives?

G. R. Ryan Manufacturing Company
INCORPORATED
Rochester, New York

ICE CREAM PLANT TO BE OPENED BY FORMER ASSISTANT DAIRY AND FOOD COMMISSIONER.

H. E. Forrester, who for eleven years has served as assistant Dairy and Food Commissioner of the State of Iowa, resigned his position May 1st, at which time he went into the butter and ice cream manufacturing business at Webster City, Iowa. The name of his plant is the Webster City Cream Company. The output will include both butter and ice cream.

Mr. Forrester's son Paul, who is at present with the Iowa City Produce Company at Iowa City, will be in charge of the ice cream department, while Mr. Forrester personally will look after the butter making end of the business.

A building, which has been leased for five years, is at present being remodeled to house this plant. It is 76 by 22 feet, and is two stories high, with a basement under the entire plant. Cement floors are being put in throughout. The equipment will include an 800 pound churn, 300 gallon ripener, a 200 gallon ice cream mixing vat, a direct drive 60 quart freezer, 10-ton ice machine, 12 horse power horizontal boiler, and all the smaller equipment that is necessary in a plant of this kind. The hardening room will have a capacity of 2,000 gallons of ice cream.

This plant will be ready for operation in a very short time.

WEST PALM BEACH TO HAVE NEW ICE CREAM PLANT.

The Palm Beach Creamery Company has bought a tract of land as a site for its ice cream plant and milk supply depot. The tract is adjacent to city terminals and the canal basin in the western part of the city. The building will be 41x53 feet with a height of two stories, in part. A fine garage will also be built.

The company is adequately financed, only 30 shares of the $100 shares of the $25,000 corporation being unsold. Dairymen at Lake Worth and Delray, originally associated with a project for a creamery in the south part of the county, have taken stock in the West Palm Beach creamery and their action is expected to lead to a consolidation of the two projects.

The West Palm Beach Creamery Company's plant will be in operation by June 1, Alf. R. Nielsen, president of the company, said recently. It can run economically on as small a quantity of milk as 300 gallons a day and an ice cream production of 100 gallons a day; it has a maximum capacity, however, of 2,000 gallons of milk and 300 gallons of ice cream. The plant will be constructed in units, so that capacity can be increased without changes in equipment. Stockholders of the company have a milk production of upward of 400 gallons of milk a day now.

Manufacture of butter will not be undertaken until the summer of 1923, the first use of the plant being as an ice cream factory and milk depot.

A UNIQUE PROCESSED FRUIT SERVICE.

An unusual feature of the processed fruit department of the Puyallup & Sumner Fruit Growers Canning Co., of Washington State, is the offer to responsible inquirers of a demonstration package of six 10-ounce samples of crushed fruits, confectioners' fruits, etc. Dr. W. S. Beekman, head of the department, says that the idea is to give prospective users samples worth while, large enough to allow them an opportunity of really testing the quality of the goods.

Dr. Beekman is one of the pioneers of the fountain fruit business and was the first to perfect American-made marachino cherries for the soda fountain trade. In his association with the Puyallup & Sumner organization he has a remarkable scope for his abilities, that organization having behind it 1800 organized growers whose ranches surround the plant in what is described as the finest bush fruit area in the world.

"There are no other berries like the berries from The Valley of the Mountain," Dr. Beekman writes. "The geographical situation and climatic conditions here are unique. The valley has the widest distribution for its products of all the fruit areas of the continent and can guarantee users a steady supply of the finest quality. It is quite within the mark to say that we have on hand right now the largest stock of processed fruit in the world, especially of maraschino cherries."

NEW ICE CREAM PLANT IN LONDON, ONT.

The Ontario Creameries, Limited, under the management of Charles Johnstone, has installed one of the most up-to-date ice cream plants in London, at a cost of approximately $50,000.

Last year the company manufactured three-quarters of a million pounds of "Marigold" butter, and this year expect to surpass that figure, as well as to manufacture ice cream, which will be sold under the same name as the butter.

The plant installed is of the latest type in the ice cream manufacturing trade. Five large refrigerators have been built.

The whole department is under expert supervision and special care has been taken to manufacture the company's product under the most sanitary conditions.

GOOD TIN FOIL MAKES THE COATED ICE CREAM BAR DISTINCTIVE AND ATTRACTIVE.

What Causes a Hollow Space in Cans of Ice Cream?

Question Asked by a Subscriber and Suggestions for Prevention

THE baker can sell holes in doughnuts and not ruin his business, but when the ice cream manufacturer sells a packer of ice cream it must not contain a hole in the center if he is to get the repeat orders which are the delight of every business man.

Some time ago we received a letter from a reader in which he told of complaints from dealers to the effect that a hollow space appeared in the middle of the ice cream can after a few customers had been served. We forwarded a copy of his letter to several ice cream manufacturers and asked them to suggest a remedy. The question and a number of the replies follow:

Question:—We have had a number of complaints recently from several of our customers in regard to our cans not being full. They say the cans appear to be filled to capacity upon arrival, but after serving a few customers they find a hollow space in the middle of the can which varies from one-half to two gallon shortage in a five gallon can.

Our mix is 9.00 fat, 34.50 total solids, and we get 100 per cent overrun and great pains are taken in drawing the cream from the freezer to see that it is not drawn too fast which might cause air pockets in cans. Are there any causes other than too low solids, too much overrun or carelessness in drawing cream from freezer that would tend to make hollow cream. Please give us all the information possible.

* * *

Raise Total Solids.

Reply:—I believe he is apparently not getting a cool enough temperature on the cream when drawing it from the freezers. The cream should be 25 degrees above zero or less when drawn from the freezer. Also, I would suggest that he check his overrun very carefully inasmuch as it is barely possible that his total net results on a vat of mix when frozen would net 100 per cent. However, if he operates several freezers it is possible that he may only be securing 80 per cent overrun on one freezer whereas he will get 120% overrun on the other and unless he measures very carefully the raw mix he puts in each individual freezer and also checks the amount of ice cream that comes out of the freezers individually, he cannot be sure of his overrun. I would also suggest very strongly that if his mix contains only 9 per cent butterfat and 34.50 total solids that he raise his total solids to be something like 37 or 38 per cent. This will improve his quality very much. Try an overrun or 90 or lower. One hundred per cent is too high.

* * *

Too Much Overrun.

Reply:—We have come through this difficulty and found it apparently was caused by two much overrun.

This man can not entirely depend upon his overrun tester but should balance the amount of gallons of his mix with the total gallons frozen. He should also use an overrun tester and he should not take an overrun to exceed 90 per cent. If he will not allow his overrun to get over 90 or 92 or 93, he will not have any troubles of this kind. He can take an overrun of 100 but is always in danger.

* * *

Don't Pull While the Batch is Swelling.

Reply:—We had a similar experience to the one outlined during the early summer of 1921, and I am thankful to say that we were able to successfully overcome it after many trials and tribulations.

I do not believe that I can give you all the information necessary for getting rid of this trouble without additional facts, as it is my guess that despite the 9 per cent fat and 34.50 total solids, there is something in his mix that is not properly balanced. If you will get this mix and send me the formula, I shall be glad to give information to the best of my ability.

My suspicion is that the person operating the freezer is not thoroughly familiar with just what takes place, and is probably in a hurry to get through with his work. In this case, he no doubt watches his batch closely, testing when he thinks he has 100 per cent, and draws as soon as he has it. Drawing the ice cream slowly at this stage of the game is dangerous, as the batch is still swelling, and the last of the batch will be so light that it will test about 150 per cent. We found this in actual practice.

With this light ice cream on top of the can, it is placed in the hardening room, where the outside hardens. The inside settles leaving the hollow space.

How to overcome it? Let the operator try this: Turn on the brine immediately upon filling the freezer, letting the batch freeze as it will. You will note in the sketch (See Fig. 1) that under normal conditions, the overrun will exceed 100 per cent at some stage of the freezing process. It is our policy to freeze past the peak, running down to where the overrun shows about 60 to 70 per cent; then shut off the brine, whipping until 100 per cent is obtained by tester, then drawing as rapidly as possible. We assume that the operator has full control over brine temperature. It is hard to hold down the overrun with high brine.

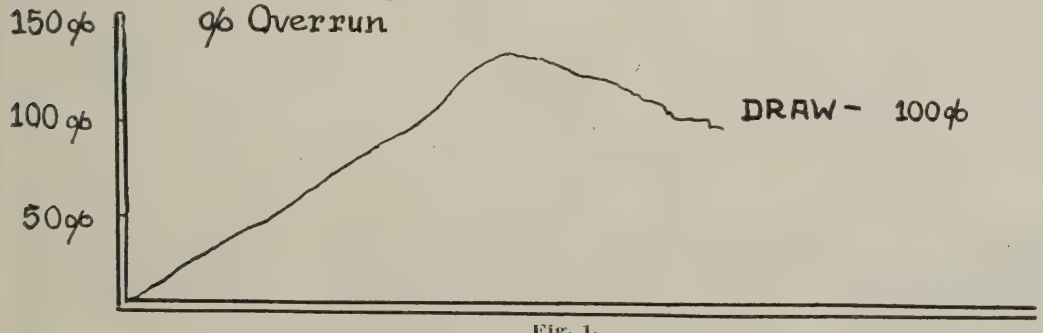

Fig. 1.

I wish you would advise me how the people come out on this, and if you will send me this formula I shall be glad to give you such further advice as I can.

* * *

Harden Quickly and Long.

Reply:—We have never had the experience that your subscriber describes.

We have always believed that 100% overrun was too much, as it is a detriment to the ice cream and if allowed to become soft, the air will escape and the mix will settle.

We believe his trouble is due to not hardening quick enough or long enough, as it settles in the middle and not all over. He should get a very nice ice cream with 9% fat and 34.50 solids.

You probably know of the old trick of drivers taking one gallon out of each can and then standing can on head and hardening, which would show a full can on opening and would gradually settle down and not be noticed. There is a nigger in the woodpile somewhere.

* * *

Overrun too High; Solids too Low.

Reply:—In looking over his letter, I notice that he is running 9% fat and 34½% total solids and from this mix is getting 100% overrun. I think this statement explains the whole difficulty, as I do not think it possible to get 100% overrun with such a low percentage of fat and solids, as we are running 12% fat and between 38 and 39% total solids and find that we cannot make satisfactory ice cream unless we pull a little less than 100%, so with the mix he is putting out, I don't see how it is possible to get so much overrun and still expect the cream to stand up. Possibly by using a great deal of gelatine to the detriment of his ice cream he might be able to make it stand up better than

NEWS ABOUT SUGAR

Items of Interest for the Ice Cream Manufacturer

WAREHOUSEMEN'S FUNCTION GROWING IN IMPORTANCE.

Distribution of sugars through warehouse consignments, says "Facts About Sugar," a practice which had been virtually suspended during the time when the Sugar Equalization Board was in control and subsequently while prices were at high levels, has now come into extensive use again and it is estimated by men familiar with distribution that refiners are now using fully one hundred warehouses scattered at different points throughout the country.

Methods Brought Up to Date.

While this system of distribution in the past presented many difficulties, owing to the inadequate protection furnished by the old style warehouses and the lax business methods of some of the proprietors, the modern warehouseman, according to traffic authorities in the sugar section, has applied thoroughly modern and up-to-date methods to his business and has increased its efficiency in a remarkable manner.

Accurate check is kept of shipments received and their condition, the interests of the refiner as against the transportation companies being fully safeguarded. Similarly the buyer of sugar is protected by the accuracy of the shipments made from warehouses, no goods being allowed to leave that are in any way damaged, and orders being accurately filled, conditions which are the reverse of the old-time wooden shed warehouse period.

In some markets the use of warehouses enables refiners to obtain through rates to destinations from the original shipping points, thereby effecting a considerable saving.

Some of the refinery trade have not yet adopted this means of distribution, preferring to keep their sugars on hand at the refining points. In the recent past, however, the refiner who has had stocks available in various parts of the country to take immediate advantage of the erratic buying movements which have developed from time to time has had considerable advantage over his competitors in the matter of distribution and has succeeded in moving an appreciably larger volume of sugar.

Advantages of Warehouse System.

Some of the advantages of the modern warehouse system are brought out in the following summary of the situation, prepared by a sugar man whose experience in this line has been unusually extensive:

It has been customary for many years for refiners to carry stocks of sugar in the larger cities of the country, such as Baltimore, Cincinnati, Pittsburgh, Cleveland, Chicago, Milwaukee and St. Louis, the reason being that because of competition it was impossible to sell over direct movement; hence, the only way to hold the trade was to have a stock on hand. This practice increased until at one time sugar was carried in a very large number of markets, and it was carried so far that finally the matter reached a state of negotiation and the number of consignment markets was very largely reduced.

The delivery of sugar in this manner necessitated shipping through public warehouses and naturally this required a kind of service that could be performed only by men understanding the business and meeting the requirements both of the refiner and the dealer, as, without care and diligence, it would be very easy for mistakes to occur, and to a certain extent the refinery leans upon the warehouseman to protect his interest in case of loss or damage and to see that proper record is made at time of arrival of the car. Many warehousemen have reached such a degree of efficiency that they have acquired a recognized reputation for careful handling so as to avoid friction in any way with either dealer or refiner. In addition to this, local service warehouses have become useful in reconsignment.

Important Service Rendered.

In many of these markets sugars are reconsigned in the area, say, of one hundred miles, on the basis of the through rate. This service requires on the part of the warehouseman a knowledge of the reconsignment tariff of the railroad handling the details, so that the through rate may be protected. He must also see that packages go out in perfect condition, that cars are properly loaded and properly billed. Unless these details are handled properly such movement does not become attractive either to the buyer or to the refiner. In some sections of the country this reconsignment feature is very pronounced, the trade for the surrounding country buying in carload lots, depending largely on delivery from reconsignment points. Hence it is of the utmost importance that this service should be performed carefully, with due regard to the interests concerned.

WE GUARANTEE TO SHOW YOU A SAVING

There have sprung up in the past few years many warehouses in the different parts of the country that make a specialty of carrying sugars — warehouses of large capacity, of fire-proof construction and with every facility to permit of unloading, storing and rehandling in a first class manner. In some parts of the country this method of delivery is more valuable than in others. The movement from New Orleans today is to a large extent by water and the sugar is carried to various central points, such as Memphis, Cairo and St. Louis, then put in a warehouse built for this special purpose, handled by those who understand the requirements, and ordered out on a reconsignment basis within a reasonable area. On account of the delay in movement by water, it is natural that the buyers would prefer delivery from these points. So far as Southern trade is concerned, therefore, this feature is likely to be a permanent one, and a necessary one, in order to hold business.

* * *

FUTURES MARKET SHOWS RAPID GROWTH IN TRADING.

From being a neglected and unimportant sideshow to the commodity market the sugar futures market of the New York Coffee and Sugar Exchange has advanced in the past few months to a position where its transactions are of large volume and where it appears to be fulfilling its anticipated function as a real barometer of trade conditions and prospects according to "Facts About Sugar." This change has come about so rapidly that its significance is not yet fully appreciated by many members of the sugar trade, although it is recognized that the futures market has recently attracted many more traders than ever before participated in it.

Operations Forecast Price Trends.

While opinions differ sharply as to the extent of its influence, a study of exchange transactions and quotations indicates that thus far this year they have been a more accurate index of the price trend and of approaching trade conditions than have the purchases of refiners in the commodity market.

From the first of January to the 26th of April, something over 1,200,000 tons of sugar have been sold on the floor of the Exchange, a quantity equal to roughly one-third of the entire Cuban crop. Sales by months in round figures have been as follows: January, 200,000 tons; February, 262,000 tons; March, 386,000 tons; April (to April 26), 325,000 tons. It is possible that the total for April may reach a higher figure than March, which broke all previous records for volume of trading on the exchange.

In the opinion of some of the best informed sugar men the growth of exchange business means that a radical change in marketing methods, so far as raw sugar is concerned, is gradually developing. They do not hesitate to predict that if the refiners are to retain their position in the making of the market they will be forced in the near future to become active exchange operators, or as an alternative will have to accept the values established by the exchange.

Opinion Not Unanimous.

This opinion, it is worth while pointing out, is by no means unanimous. There is a considerable body of opinion, particularly in refining circles, which holds that circumstances of a temporary nature particularly favorable to exchange trading have been responsible for the recent widening of the exchange's influence. They admit that producers are becoming more encouraged to dispose of

Variation in Flavor Sells More Bars

Do not wear out customers' liking for ice cream bars by giving them the same flavor day after day.

The public demands variation, and the manufacturer who gives his trade novelty in the way of flavor experiences the best demand for his bars.

Mapleine

Mapleine Bars appeal to the trade because Mapleine Ice Cream is keenly liked and because its smooth, rich, maply flavor blends so deliciously with the chocolate coating.

Mapleine also makes an attractive combining flavor in the Neapolitan Bars manufacturers are finding popular.

Give Mapleine Bars a try-out.

Order Mapleine of your supply man or send us $3.00 for a quart tri al bottle.

CRESCENT MANUFACTURING CO.

Seattle, Washington

their sugars, in part at least, through the exchange, but this, they contend, will eventually result in depressing prices unless the increase in refiners' purchasing through this agency keeps pace with the increase in sellers.

In line with this argument is the contention that the sugars which have been bought by operators must be considered as a potential depressing factor in the market until they have passed into the hands of refiners.

Past experience does not seem to bear this out. During the declining market of last year the exchange apparently sensed the weakness in the situation and registered it in its quotations sooner than did the refiners.

On the rising market of this year the exchange again apparently showed its collective judgment to be more accurate than that of the individual refiners. Almost without exception the exchange prices this year have been appreciably higher than those governing the actual market. Operators who bought actual sugars as a hedge against their exchange transactions found no difficulty in reselling to refiners when the sugars arrived, the actual market having risen to the levels earlier indicated by exchange transactions.

Still another objection to exchange trading appears to have gone by the board. Refiners formerly contended, and some still do, that the exchange did not furnish a broad enough market in which to operate, and that an attempt to buy 10,000 tons of sugar, for instance, would be followed by severe price fluctuations.

If the figures for the volume of tradeing were not sufficient to offset this argument, other recent occurrences can be pointed out as doing so. In one day recently no less than 40,000 tons of sugar were traded in on the exchange with only two points variation in prices. Still more recently, within the past ten days, on one occasion 140 lots, representing about 17,000 tons of sugar, were traded in for October, which is considered in exchange circles as comparatively a "dead" month, without any fluctuation in price whatever being recorded.

* * *

NEW RULING ON SUGAR IMPORTS.

Collectors of customs at ports of the United States have been advised by the Treasury Department that certificates of origin will no longer be required in connection with imports of sugar, as information received by the department indicates that no foreign country is at present paying an export bounty on this commodity.

The Treasury Department has, at the same time, advised the State Department that consular officers, in certifying invoices, should note for the collector of customs in this country any information he may have regarding the payment of bounty on sugar covered by the invoices, either in the raw or the refined state. Whenever such payment is reported or indicated the facts are to be reported by the collector to the Treasury Department for investigation and instructions.

* * *

THE SUPPLY.

There is and there will be at the end of the year a considerable surplus of sugar available for use in this country, declares Federal Sugar Refining Company in a close statistical survey of the world sugar situation, and any rumors to the contrary are for the speculative purpose of raising prices. Any extended increase in raw sugar prices is unjustifiable in view of the adequate supplies and every time attempts have been made to raise them the hollowness of the boom has been quickly demonstrated by collapse. If manufacturers and consumers using sugar will bear in mind the facts, buying will be sensible and prices will be kept down at reasonable levels, insists President Claus A. Spreckels of the Federal Sugar Refining Company.

There will be 1,246,947 tons of sugar in excess of our needs in this country and Cuba on October 1, and on Jan. 1, 1923, there will be 1,396,947 tons surplus sugar here and in Cuba, according to itemized estimates of stocks, consumption and production prepared by the Federal statisticians. A total of 4,171,947 tons of refined sugar will be available before the new domestic crops come to market. This includes 300,000 tons balance of 1921-22 beet crop and 3,871,947 tons refined sugar produced from 4,163,384 tons raw sugar. The raw sugar aggregate includes 916,770 tons stocks at Cuban shipping ports March 25, 2,005,358 tons balance of Cuban crop, 75,000 tons Cuban sugar afloat to U. S., 269,255 tons refiners' and importers' stocks and 314,000 tons, 378,000 tons, 160,000 tons, 5,000 tons and 40,000 tons as balance of receipts from Porto Rico, Hawaii, Philippines, Virgin Islands and outside sources respectively. Allowing 625,000 tons for exports from Cuba or the U. S. during the rest of the year, the balance available for domestic requirements is 3,546,947 tons. With the consumption up to October 1 amounting to 2,300,000 tons, the indicated surplus is 1,246,947 tons on that date. At this time the domestic beet and cane sugar crop, which should equal last year's amount of 1,100,000 tons, will be pressing on the market. Placing consumption for the last quarter of the year at 950,000 tons, the carry-over on Jan. 1, 1923, should be, conservatively 1,396,947 tons.

Cuba's crop this year will amount to 3,580,571 tons, according to the first detailed estimates to reach this country, those from the Federal representative on the island. Every year at this season there are rumors of poor crops but the indications are this year that the final result will be above rather than below the estimate. A number of centrals may register a shortage, some holding part of the cane for next year. On the whole, the eastern half of the island will more than make up for any shortage in the other half, the eastern part, for the first time in Cuban history, producing more than the "six ports". While the cane fires this year have been numerous and serious, the final effect on the crop will not be considerable and has been allowed for in the estimate. On the other hand, the yield of sugar is in many cases unusually high, some centrals reporting as high as 14 per cent in some of their runs.

Over a million tons more sugar have been shipped from Cuba since the beginning of the year than in the corresponding period of last year. Record shipments have been leaving the islands in recent weeks. It is obvious, however, that this rate will not be maintained.

Relations between the United States and Cuba on sugar are by no means settled. Cuba has strenuously resisted all efforts to limit production or to limit exports to the United States. The probable approval of the permanent tariff of 1.60 cents per pound on Cuban sugar may lead to the island passing retaliatory measures against goods from this country.

Europe's sugar industry is regaining its pre-war production. Preparations are now being made for the next crop and it is expected that France will have more than its last crop of 300,000 tons, and Germany will exceed its last output of 1,320,000 tons. English refiners are making vigorous efforts to reach their maximium capacity and this competition is likely to affect American refined sugar. There is a good possibility that there will be strong competition for European business with Cuba by sugar from other sources. It is believed that never before has Java sold so little of its new crop as this year.

A. E. DIXON.

You just can't keep a good man down. Mr. A. E. Dixon, Fayetteville, North Carolina, and known to Review readers best as the hustling secretary of the North Carolina Ice Cream Manufacturers' Association, has had new honors thrust upon him. He is now president of the North Carolina Ice Exchange, which recently held a very successful convention at Winston-Salem and Dixon was the unanimous choice for the highest office in the organization. Those ice men know a good thing when they see it. Mr. Dixon's work in the ice cream organization field is attracting much favorable attention and shows what a real live wire can do.

A. E. DIXON.

NEW DAIRY PLANT AT FULTON, MISSOURI.

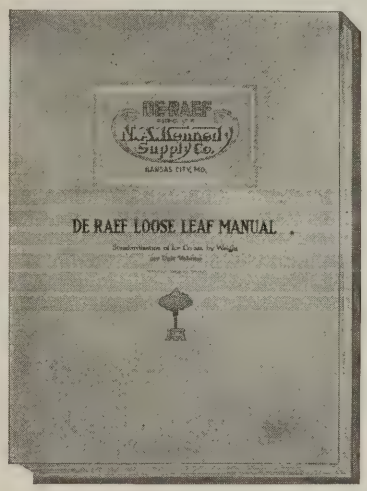
The White Eagle Dairy Company of Columbia, Missouri, engaged in the wholesale and retail milk, butter, cheese and ice cream business, and capitalized at $75,000.00, recently established a branch plant at Fulton, Missouri.

The Fulton plant will handle the cream of the farmers in the surrounding territory, buying direct from the farmers. The firm does not operate cream buying stations.

The new plant is equipped with a horizontal freezer, a pasteurizer, mixer, 500 pound churn, one ton truck, and miscellaneous small equipment. It expects to supply the ice cream and butter for dealers in Fulton and vicinity.

The White Eagle Dairy Company had a total output last year of $160,000, and, at the Missouri State Fair last year, won first prize on pasteurized milk, pasteurized cream, and cottage cheese, third prize on creamery butter, and sweepstakes on single daisy cream cheese. There were twenty entries in this exhibit representing eight states.

HAWN ICE CREAM COMPANY RE-ORGANIZES.



The Hawn Ice Cream Company of Monroe, North Carolina, has recently re-organized, and changed its name to the Monroe Creamery Company. The capital stock has been increased $5,500.00 and a $5,000.00 refrigeration plant has been added, which contains a hardening room for ice cream. This plant, with its new facilities, has a daily capacity of 2,000 pounds of butter, 1,000 gallons of ice cream, and 500 gallons of milk. The plant is among the most up-to-date in the south.

Mr. W. E. Funderburk is President and General Manager, and Miss M. J. Beam is Secretary and Treasurer of the new organization.

You'll make better ice cream if you get the "Ice Cream Review."

FRED EWARD INVENTS DIPPING MACHINE.

Fred O. Eward, Secretary-Treasurer of the Marion Ice and Cold Storage Company, Marion, Indiana, is the inventor of a novel and extremely efficient chocolate dipping machine for the manufacture of all chocolate coated ice cream centered confections.

FRED O. EWARD.

Mr. Eward at first devised this machine for his own use in the production of the nationally known "Eskimo Pie," but the fame of this unusual dipping process soon spread and the Marion Ice and Cold Storage Company was deluged with letters of inquiry together with some offers of purchase. Pressed by the demands made upon him, Mr. Eward applied for a patent, formed a company known as the Chocolate Dipping Machine Company, and started to fill the orders that came in.

Because of the machine's labor, time and money saving qualities and its high production of ice cream bar confections—dozens of manufacturers soon put in a clamor for the devices. Two girls can easily dip and hand to the wrappers 300 dozen chocolate coated ice cream bar confections in 6 hours.

Now Mr. Eward has built up a substantial business due largely to personal advertising. With the machine which he conceived to assist his own manufacturing he has automatically assisted dozens of other manufacturers.

Mr. Eward is a director of the National Association of Ice Industries, and has a large number of friends in the ice and refrigerating industry, who will learn with interest of his latest success.

A BOOKLET ON PACKAGE ICE CREAM.

A treatise, in booklet form, on improved packaging and marketing methods for ice cream is being published by the Purity Paper Vessels Company. The booklet treats of the advisability of packaging ice cream in pint and quart containers in the manufacturers' plant in preference to having the dealer dip it up in "carry-home" containers.

Ice cream is daily becoming a more staple product and is being considered a real food and delightful dessert instead of a mere confection. The modern tendency is to buy foods in packages for convenience and cleanliness. This fact, combined with the fact that the ice cream supply manufacturers are making machines which will neatly fill one package with ice cream of two or three flavors at the same time, is increasing the sales of many manufacturers, according to their own statement.

One valuable feature of this booklet is a thorough review of the exact details of an advertising campaign for packaged ice cream which was conducted by a large Missouri manufacturer. This particular manufacturer very greatly increased his total sales of ice cream. On request, this booklet may be obtained from the Purity Paper Vessels Company, 5 West Conway St., Baltimore, Md., without cost.

OKLAHOMA ICE CREAM FACTORY INSTALLS NEW EQUIPMENT.

The Washita Valley Ice Cream Company, Anadarko, Oklahoma, has recently completed the installation of new refrigerating machinery, and now has the plant in fine running order. This plant is situated in the most fertile section of the state, and in a well developed dairy district. All of the milk and cream used is obtained in the vicinity, and the ice cream is made entirely of natural milk and cream.

The factory, though small, is equipped with the most modern and best machinery obtainable. The owners are the operators, and all have had years of experience in making ice cream.

This company is capitalized at $10,000. T. L. Whittaker is president of the organization.

NEW ICE CREAM FIRM IN SANDUSKY.

The Kelly Ice Cream Company has just been organized at Sandusky, Ohio. The incorporators of the new company are Carl A. Busch, Susan Busch, E. R. Kelly, M. Estelle Kelly and Nicholas P. Brown. The concern is capitalized at $25,000. E. R. Kelly will be president of the organization and Carl A. Busch secretary and treasurer. Mr. Kelly has been with Reymer & Bros., Pittsburgh, manufacturers of chocolates, for the last fifteen years, and Mr. Busch has been with the Sweet Valley Products Company and its predecessor, the Sweet Valley Wine Company, for ten years.

The building which has been secured for manufacturing purposes has a floor space 62 by 33 feet. Production of ice cream will be started just as soon as the necessary machinery and equipment can be installed.

WHAT CAUSES THE HOLLOW IN CANS OF ICE CREAM.

(Continued from page 151)

now, but the practice of using large quantities of gelatine certainly is not conductive to good ice cream.

I don't believe the manner in which the freezers are pulled has anything to do with the difficulty. The trouble lies entirely with the mix.

* * *

Reply:—Your subscriber's trouble, in our estimation, is very likely too much air. In other words, when a manufacturer tries to sell air instead of ice cream he is very likely to get in just such trouble as mentioned. We do not allow but eighty per cent overrun by weight which gives us ice cream in the finished product weighing five pounds net per gallon; this should be the standard weight throughout the country. Eighty per cent overrun is an honest legitimate ice cream and we would advise your subscriber to manufacture a cream weighing five pounds net to the gallon in the finished product and no doubt his trouble will vanish and he will have a clearer conscience.

⚜

NEW EMAUS ICE CREAM PLANT IN OPERATION.

Stortz and Eisenhard, Emaus, Pa., proprietors of the A La Mode Restaurant, recently began the manufacture of ice cream. They have a new 60x80 ft. building for a factory which is modernly equipped and has a capacity of about 100 gallons per day at present. They started the plant with the intention of supplying only their own needs, but have already obtained some wholesale business and expect to continue to grow. Mr. Frank Stortz is manager of the plant.

⚜

A NEW PENNSYLVANIA ICE CREAM PLANT.

Windber, Pennsylvania, is to have a new ice cream factory, the building and refrigerating equipment to cost $40,000. Mr. Frank Tarr, a hotel man, will engage in the ice cream business as a new venture this year. A large part of the new building will be used for manufacturing ice cream. The McCormick Company, Inc., of Pittsburgh, are the architects and engineers in charge of the work.

⚜

"FISCHL'S-O-FISCHL."

A total of 1,065 persons entered the name contest conducted by the Fischl Dairy Company, Manitowoc, Wis., to find a suitable name for the ice cream which the company is to manufacture on completion of its new and modern ice cream plant which is now under construction.

The name of the cream is to be "Fischl's-O-Fischl."

ICE CREAM SANDWICH MACHINES ARE POPULAR ATTRACTIONS AT PARTIES, BAZAARS, ETC.

GIRARD CREAMERY TO BE REBUILT AFTER FIRE.

One of the most interesting, if not regrettable incidents that has been brought to our attention recently was contained in a letter giving us information regarding a fire at the plant of the Roselle Creamery at Girard, Kansas,—interesting because it is a wonderful example of typical American pluck and grit. Not the least interesting thing about it is the way these qualities were recognized by the people under whose observation they came. Such a chronicle does much to reinforce one's faith in the innate goodness and whole heartedness of people in general.

In 1901, at Excelsior Springs, Mo., Mr. H. A. Roselle and his father started in the ice cream business, with a few old five gallon ice cream tubs, and with no capital other than the profits from the business. Just at the time when the hard work was beginning to bring a reward, Mr. Roselle's father died.

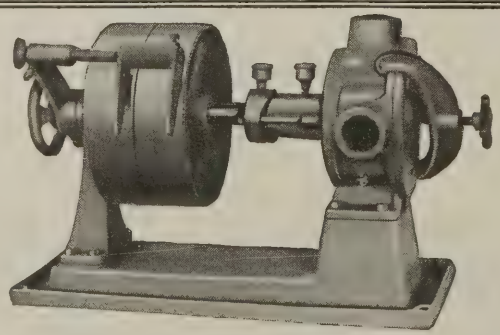
In 1910 he took over his father's interest in the business, and, in spite of severe competition, built up a good business and erected a fine building. In 1919 he sold out this business. For the benefit of his only brother, who had served overseas, a partnership was formed, and the creamery at Girard taken over. This creamery had been allowed to run down, and was not a paying proposition, but Mr. Roselle could see a good future for the man who would get out and hustle. Accordingly preparations were made, the plant was overhauled, and it was their intention to open up in spring. In January, 1920, the brother died suddenly, leaving him the entire burden of starting the new business. By hard work and a desire to succeed, however, the business was put on a successful basis. The first year did not bring much financial profit, but Mr. Roselle got acquainted, advertised, and put out quality goods. In 1921 the business kept climbing, and its end brought to a close the most successful year that he had ever experienced, outgrowing his equipment. Plans were made for an additional plant and extensive new equipment. In addition to the ice cream business he had built up a good butter business, and was also supplying pasteurized milk to the city trade.

Mr. Roselle worked hard all winter building new additions and installing new equipment, and in a short time would have had everything completed.

Monday, March 27th, Mr. Roselle and some of the workmen worked late, making final connection to some of the new equipment. He and his son were the last to leave the plant, which was carefully inspected to see that everything was all right, as it was only partly covered by insurance. The fire seems to have started upstairs, and was a roaring furnace when discovered. There was no chance of checking it.

When Mr. Roselle arrived the roof was falling in. His sensation at seeing the results of his years of struggle and effort, and his immediate hopes for the future go up in smoke, can possibly be imagined, but not described.

He may be pardoned if for a moment he felt like giving up. But the citizens of Girard, realizing the situation, gave such hearty promises of support that he was placed in a position where he felt that he would not be doing his duty if he did not make an effort to come back. Before the fire was out, a plan was on foot to put up a building for him, but because of the high cost of equipment, it was not possible to raise enough money by donations to carry the first plan through. It was then decided to organize a stock company, and incorporate for $12,000, and with what little assets Mr. Roselle had left, and his good will, they gave him 51 per cent of the stock. He called a meeting of the citizens, placed his case before them, and said that, while it was a hard job, he would endeavor to justify their confidence by making a creditable come-back. The Davis-Watkins Dairymen's Manufacturing Company had a lot of confidence in him, and offered to equip the plant on very liberal terms, which was a great help.



The American Legion of Girard, in memory of his brother, have offered to clean out the ruins whenever Mr. Roselle is ready to allow them to do so.

Through the kindness of the manager of the Crawford County Creamery of Pittsburg, Kansas, he is being supplied with ice cream and butter to accommodate his trade, and Mr. Decker, of Girard, is furnishing the soda water. "How can a fellow lay down on the job," he says, "when even his competitors come to his rescue?"

The building that will be constructed will be a 40 by 70 ft. brick structure, half of which will be two stories in height, and the other half one. It will be constructed and equipped with the idea of making additions as the business justifies. The Davis-Watkins people assured Mr. Roselle that if he had a building ready in thirty days, they would have the plant equipped and in running order by June 15th.

It must be people of the calibre of Mr. Roselle that Edmund Vance Cooke had in mind in his well known poem, "How Did You Die?" when he says, "The harder you fall, the higher you'll bounce." It appears to us that this piece of misfortune came merely by way of backing up for a new start to a bigger, brighter future.

Does Carbon Dioxid in Carbonated Milk and Milk Products Destroy Bacteria?

By M. J. PRUCHA, J. M. BRANNON and A. S. AMBROSE in Circular No. 256 of University of Illinois Agricultural College and Experiment Station

CARBON dioxid or carbonic acid gas, is a transparent gas under ordinary atmospheric pressure and temperature. It is readily soluble in water and the solubility is increased under pressure. Water charged with this gas is known as soda water, or as carbonated water. Such water has a plasant, acid, pungent taste, and on account of this many of the soft drinks are charged with it.

The use of carbonated dioxid in dariy products is not a new idea. The ice cream soda, which consits largely of ice cream suspended in carbonated water, has been known for years. Some of the fermented drinks, such as kumis and kefir, become charged with carbon dioxid as a result of fermentation, and these drinks have been known for generations. In 1906 Van Slyke and Bosworth[1] conducted some experiments on carbonated milk. They concluded that it makes a pleasant beverage and may find practical use as a healthful drink.

From the sanitary standpoint, the use of carbon dioxid in foods and in drinks is of special interest. It is a well known fact that in general carbon dioxid atmosphere is injurious to animals and to plants. It has also been known that under certain conditions this gas is harmful to certain bacteria. On these accounts, various claims have been made as to the sanitary quality of carbonated drinks and carbonated foods.

This circular is a preliminary report of experiments to determine the influence of carbon dioxid on the germ life in carbonated diary products. It includes a brief summary of four experiments: (1) effect of carbon dioxid on germ life in carbonated ice cream; (2) effect of carbon dioxid on typhoid bacteria in carbonated ice cream; (3) behavior of bacteria in carbon dioxid atmosphere; (4) effect of carbon dioxid on bacteria in milk under pressure.

The plate mehod was used in counting the bacteria. In sampling the hardened ice cream, a long cylindrical plug of ice cream was taken by means of a cheese trier and put into a glass bottle. After it had melted, the desired dilutions were made from it and it was then plated. The medium used for the plating was lactose agar having the standard composition. The plates were incubated four days at room temperature and one day at 86 degrees Fahrenheit. The counts as given are averages of two or more plates in each case.

The plates from the material with typhoid bacteria were incubated only one day at 100 degrees Fahrenheit.

Experiment No. 1.

Effect of Carbon Dioxid on Germ Life in Carbonated Ice Cream.

In this experiment seven 12-gallon lots of ice cream were prepared. Each lot was divided into two portions; the first was frozen in the usual way, and the second was frozen in carbon dioxid atmosphere. A 50-quart Perfection Dreadnaught Brine Freezer was used. The following procedeure was used in freezing the ice cream in carbon dioxid: A rubber tube was fastened to the nozzle of a carbon dioxid tank, and the loose end of the tube was inserted into the freezer thru the fruit hopper. The gas was then blown into the freezer for about 30 seconds. The ice cream mix was then poured into the freezer. After the freezr was run for a few minutes, the carbon dioxid was again blown in for about 30 seconds, the loose end of the rubber tube being inserted under the surface of the mix and the gas allowed to bubble thru it. As soon as the ice cream was frozen, it was put into two-gallon storage cans which were placed in the hardening room and kept there during the experiment. The temperature of the hardening room averaged about two degrees below zero Fahrenheit, varying between ten below and eight above.

Samples for the bacteriological examination were taken, first, from the mix prior to the freezing, and then from the ice cream, both the plain and the carbonated, immediately after it was frozen. Subsequent samples were taken at frequent intervals during the experiment. The results of the bacteriological examinations are given in Table 1.

In comparing the bacterial counts in the plain and in the carbonated ice cream in table 1, we are forced to the conclusion that the carbon dioxid gas did not cause any appreciable reduction in the number of bacteria in the carbonated ice cream. If it did destroy any bacteria, the number was so small that our method did not detect it. One of the lots of ice cream which is not included in this table was kept in the hardening room for six months. Even after this long period of time the carbonated ice cream had just any many bacteria as the plain ice cream.

Table 1.—Effect of Carbon Dioxid on the Bacteria in Carbonaated Ice Cream Bacteria Per CC. of Ice Cream.

Experiment 2.

Effect of Carbon Dioxid on Typhoid Bacteria in Carbonated Ice Cream.

It was seen in Experiment 1 that the bacteria in the carbonated ice cream were not appreciably harmed. However, these bacteria were not pathogenic. Now it is a well known fact that the pathogenic bacteria, as a rule, are more sensitive to environmental conditions than the non-pathogenic. It was therefore necessary

to determine how the pathogenic bacteria would behave in carbonated ice cream. Typhoid bacteria were selected for this purpose.

About four quarts of ice cream mix were sterilized and then heavily inoculated with the typhoid bacteria. Half of the mix was frozen plain and half was frozen in carbon dioxid. A one-gallon White Mountain freezer was used for this purpose.

Samples were taken from the mix prior to freezing and then from both the plain and the carbonated ice cream immediately after freezing. The ice cream was then stored in the hardening room and samples were again taken five and twelve days later. The results of the examination of these samples are shown in Table 2.

Table 2.—Effect of Carbon Dioxid on Typhoid Bacteria in Carbonated Ice Cream.

Samples	Bacteria per cc. of ice cream. Plain	Carbonated
Mix	24,700,000	
Freshly frozen	50,050,000	50,700,000
5 days old	8,180,000	9,380,000
12 days old	10,465,000	6,896,000

The samples from the freshly frozen ice cream gave much larger counts than the sample from the mix, altho the interval of time between them was only about one hour. This apparent increase was probably due to the breaking up of the bacterial clumps during the process of freezing. The samples taken after the ice cream was kept in the hardening room for five days showed a sharp reduction in the number of typhoid bacteria. Similar reduction, however, took place in both the plain and the carbonated ice cream and could not be attributed to the carbon dioxid. The samples taken after the ice cream was in storage for twelve days showed but a slight change in the counts. There were fewer bacteria in the carbonated ice cream than in the plain at this time. Whether or not this was due to the effect of the carbon dioxid is not known but will be determined when this experimental study is completed. This is certain, there were still plenty of living typhoid bacteria in the ice cream after twelve days of storage.

From the above two experiments, it seems very evident that the incorporation of the carbon dioxid gas into the ice cream during the process of freezing does not guarantee the ice cream to be a safe product.

Experiment 3.

Behavior of Bacteria in Carbon Dioxid Atmosphere.

In the process of making the carbonated ice cream, the carbon dioxid gas is blown into the freezer in order to replace the air by the gas. Carbon dioxid and air mix readily in all proportion and it is to be expected that what is incorporated into the ice cream is not pure carbon dioxid but a mixture of this gas and air. The effect that such a mixture would have on the bacteria may be quite different from that produced by the pure gas.

This experiment deals with the effect of pure carbon dioxid gas on bacteria. Twenty different cultures of bacteria from milk and ice cream, and also two pathogenic bacteria were inoculated into milk and on the surface of agar jelly. They were placed in an air-tight vessel and the air was replaced by carbon dioxid gas. They were kept in this condition at room temperature for five days. The examination of these cultures at the end of five days showed that on the agar jelly only two of the twenty different bacteria could grow in carbon dioxid atmosphere. The remaining eighteen showed no visible signs of growth. These agar cultures were then taken out and were left in the open air for a few days to determine whether or not the bacteria were killed by the carbon dioxid gas. All of them except three resumed their growth, indicating that the gas did not kill them. The three cultures that were killed were the two pathogenic bacteria and one of the non-pathogenic.

Entirely different results were obtained when these bacteria were subjectd to th carbon dioxid gas in milk. Not on of them was killed by the gas. Not only that, but in all cases they increased in number. It would seem that in milk the bacteria found certain protection against the action of the gas.

Experiment 4.

Effect of Carbon Dioxid on Bacteria in Milk Under Pressure.

Since the bacteria could survive and even grow in the milk when they were kept in pure carbon dioxid gas, it was decided to go a step further and note the effect on bacteria when the milk was charged with the gas under pressure. For this purpose one-quart soda-water bottles were used. The carbon dioxid was first blown, thru the bottles to replace the air by the gas. The bottles were then filled with the milk and the gas was admitted under pressure while the bottles were being shaken vigorously. The pressure of ten, twenty, forty, and sixty pounds were tested. The bottles were kept at room temperature. Each day samples were taken from the bottles for bacteriological examination; the pressure was tested and any decrease in pressure was adjusted. In no case, however, did the pressure decrease more than one pound.

Table 3.—Effect of Carbon Dioxid on Bacteria in Milk Under Pressure. *

Age of Milk	Untreated	Under 10 lbs. pressure	Under 20 lbs. pressure	Under 40 lbs. pressure	Under 60 lbs. pressure
Fresh	35	35	35	35	35
1 day old	1,606,000	93,000	34,000	3,740	1,270
2 days old	.....	630,000	1,044,000	292,000	175,200
4 days old	.....	.....	.....	428,000	359,000
Soured in	30 hours	48 hours	3 days	5 days	9 days

(* **Note.**—Figures represent thousands, 000 omitted.)

The treatment of milk with carbon dioxid under pressure delayed the souring of the milk. The untreated milk soured in thirty hours. Under 10 pounds pressure it soured in forty-eight hours, under 20 pounds pressure in three days, under 40 pounds pressure in five days, and under 60 pounds pressure in nine days.

In Table 3 are given the bacteriological results from one of the series in this experiment. It is seen that the bacteria grew under all the pressures tested. Under 60 pounds pressure they increased in four days from 35,000 to 359,000 per cc. of milk.

In another series of this experiment, the milk was first sterilized and then inoculated with typhoid bacteria. The milk was then subjected to 10 and to 20 pounds pressure. The typhoid bacteria were not killed under these conditions. In four days under 20 pounds pressure they increased from 47,000,000 to 153,000,000 per cc. of milk.

In these preliminary experiments, the authors were concerned only with the sanitary aspects of carbonated milk and carbonated milk products. The process may have many commercial advantages and it may be of decided benefit to the dairy industry; however, the results of these experiments point to the conclusion that the process cannot be relied upon as a means of insuring the sanitary quality of dairy products.

Note.—The terms carbonated ice cream, carbonated milk, etc., as used in this article, refer to laboratory products made by laboratory methods, and not to products made by commercial processes patented or otherwise.

TEXAS LONGHORNS

President—J. R. KRAMER, Creamery Package Mfg. Co., Dallas, Texas.

Secretary—J. B. HUFF, Prall-Huff Co., Fort Worth, Texas.

THEY BROUGHT HOME THE "MEAT."

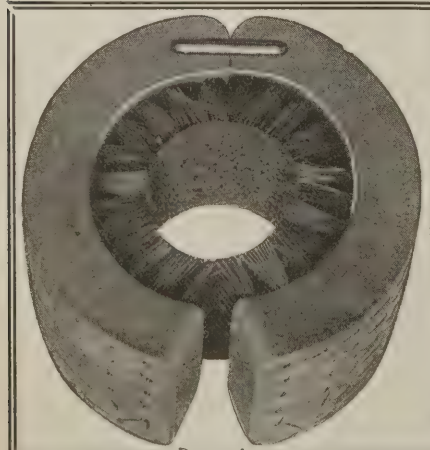
This is the bait the nimrods take, the nimrods take, the nimrods take when they start out the ducks to wake, so early in the morning. They take a nip before they go—a good one, ah! and long and slow, for fear the chills will lay them low, lay them low, so early in the morning. Another when they're on the street, which they repeat each time they meet for "luck" — for that's the way to greet a hunter in the morning. And when they are on the water's brink again they drink without a wink — to fight malaria they think it proper in the morning. They tip a flask with true delight when there's a flight; one at the mart and one to part; but none when in the house they dart expecting there'll be mourning. This is the bait the hunters try, when ducks they buy at prices high, and tell each one a bigger lie, of hunting in the morning.

This is a picture of a duck hunting party at Katy, Tex. In the party are W. H. Irvin, of the Irvin Sanitary Ice Cream Company, Houston, Texas; Jim L. Nelson, of the C. Nelson Manufacturing Company, member of the Texas Longhorns and all the rest of 'em, St. Louis, Mo.; "Babe" Eule of Katy, Texas, and Gabe S. Wegener, of the Hudson Manufacturing Company, member of the Texas Longhorns, and the Badger Flyers, Chicago, Ill. Looks like they got their share, doesn't it? Judging from their mode of conveyance in reaching the scene of the duck hunting, they may have been slow getting there but they made up for it after they arrived—all we've got to say is that we'd be afraid to repeat our duck-hunting experiences to fellows who have taken an ox along to carry home the spoils—and say, folks, we don't want you to get these pictures mixed—the one below is the duck hunting party.

W. H. Irvin, Jim Nelson, "Babe" Eule, Gabe Wegener.

A GOOD METHOD FOR KEEPING CHOCOLATE COATED ICE CREAM BARS HARD.

A California ice cream manufacturer suggests a good way to keep chocolate coated ice cream during hot weather:—



We quote from his letter as follows:

"We have been packing our Eskimo Pies on end in round ice cream cans—two gallon, three gallon and five gallon cans containing five, nine and fifteen dozen respectively.

"These cans are then stored in our ice box and sent out on the routes exactly the same as bulk ice cream.

"We have found this method of handling them to be convenient and economical and we have had practically no trouble with the pies becoming soft except in the case of shipping customers, who do not appreciate the importance of keeping the pies firmly frozen the same as bulk ice cream.

"The sale of pies has dropped off considerably since the first few weeks. As yet we have had no real warm weather so we cannot tell exactly what the sales will be during the summer months, but we still feel that Eskimo Pies will continue as a prominent sideline."

NEWS FROM FAR AND NEAR.

(Concluded from page 110)

Sweetwater, Tex.—The Sweetwater Ice Cream Company was recently organized and began operations about April first.

Appalachia, Va.—The Norton Ice and Cold Storage Company is preparing to build a new ice and ice cream plant in the near future.

Richmond, Va.—The Horn Ice Cream Company is building an ice cream plant here that is to be modern in every respect.

Fairmont, W. Va.—The new plant of the Diamond Ice Cream Co., a new Fairmont concern, is now in operation and is supplying to twenty-eight dealers in this vicinity a total of 700 gallons of ice cream daily. The officers of the firm are: J. W. Preston, president; W. Nelson Beale, secretary; E. Carl Frame, vice-pres.; and M. M. Foster is treasurer of the company and general manager of the plant. The firm is incorporated for $50,000, and the equipment cost in the neighborhood of $20,000.

Grafton, W. Va.—The Acme Ice Cream Company which has been operating in Grafton for two years has sold its entire holdings to Mr. Thomas E. Lee of Clarksburg. The deal involved something like $80,000 and Mr. Lee states that $25,000 more will be spent for additional machinery. The plant is being remodeled from top to bottom and put in first class shape. Mr. Kenneth Haught will have charge of the plant.

Parkersburg, W. Va.—The Imperial Ice Cream Co. recently increased its capital from $625,000 to $1,000,000.

Yakima, Wash.—A straight carload of dipping chocolate arrived in Yakima recently from Connecticut to supply the Yakima creameries with coating for ice cream bars. It is worth $11,000 and the first full carload of this commodity consigned to Yakima.

Beaver Dam, Wis.—The local plant of the Storck's Product Company recently started operations on a small scale.

New up-to-date equipment has been installed and Mr. J. M. Albrecht of Schlesingerville stated that the capacity of the plant with this equipment would be about one thousand gallons of ice cream daily. They also have a cooling and storage room with a capacity of ten thousand gallons of ice cream.

The Storck's Products Company is a $100,000 corporation and has a large plant at Schlesingerville where ice cream and cereal beverages are manufactured. The Beaver Dam plant will be in charge of Mr. August Storck, of Schlesingerville.

Burlington, Wis.—The Kellogg Ice Cream Company are now occupying the new addition to their ice cream factory and will now be in good shape to handle their large and increasing business.

ANOTHER QUESTION ANSWERED BY PROFESSOR BAER.

Dear Sir:—I would appreciate it very much if you would give me the correct per cent of: Fat, serum solids and total solids, also sugar per cent of the following:

913 lbs. 36% cream, 1162 lbs., 3.5% milk, 900 lbs. condensed skim, 500 lbs. sugar, 16 lbs, gelatine, 2 lbs. improver, 51 lbs. water.

What per cent gelatine does this contain? Is this a good mix? If not kindly let me know how to change. We are getting an average of 840 gallons of ice cream from this mix. F. I. CO.

Reply: I have noticed that you did not give any name or address. It will, therefore, be necessary to wait for a reply until it is published in The Ice Cream Review. If you had signed your letter and given your address, you would have received a personal reply.

I have analyzed your mix and you will find it given below in table 1. You will notice that you have about 10.5% butterfat and 12% serum solids. There is absolutely no reason why you should not be able to make a very excellent quality of ice cream from this mix, and if I have any objections at all, I would say that you are using a little more milk serum solids than is necessary, especially when you use 900 pounds of condensed skim milk in the formula.

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
913.0 lbs. 36% cream	328.68	51.98	380.66
1162.0 lbs. 3.5% milk	40.67	99.77	140.44
900.0 lbs. condensed skim, 30%	.....	270.00	270.00
500.0 lbs. sugar	.....	.....	475.00
16.0 lbs. gelatine	.....	.....	15.20
2.0 lbs. improver	.....	.....	1.90
51.0 lbs. water	.....	.....	.....
3544.0 lbs.	369.35	421.75	1283.20
Per cent	10.42	11.9	36.2

Cherry Ice Cream Batch Mixers

Are a Fine Investment for Every Up-to-Date Plant

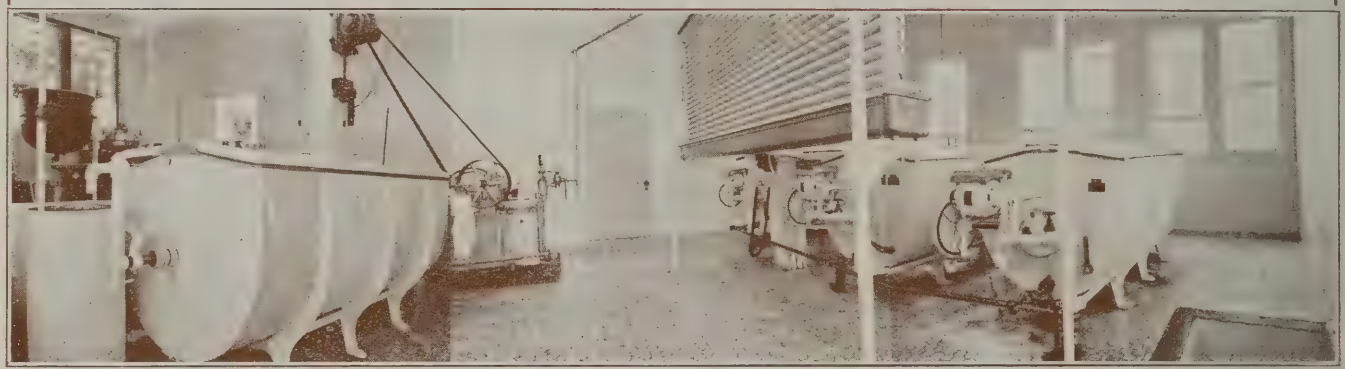

Illustration shows the Model 1—Class "A" Cherry Batch Mixers used in the plant of the Allen Ice Cream Co., Rockford, Ill.

The Cherry Batch Mixer shown above is the Model "C" machine. It is an upright mixer of the water jacketed type.

Scientific curing of the batch in a modern batch mixer under accurate control of temperature has much to do with the quality and the **quantity** of the cream delivered by your freezers.

And pre-cooling the cream before it goes to the freezers speeds up the freezing operation, adds to the fluffiness of the ice cream, and in the end, saves refrigeration.

We build Batch Mixers in the following styles:

Model 1. Cherry Horizontal Mixer, Cooler, Storage Vat and Pasteurizer—all in one, adapted to large plants. Capacities 100 gallons to 1,000 gallons.

Model 2A. Vertical Batch Mixer, 50 gallon and 100 gallon sizes only. Has double dasher.

Model 2B. Same machine, with single dasher. 30 gallons to 100 gallons capacities.

Model "C". Especially adapted for preparing mix for emulsifiers. Capacities 30, 50, 75 and 100 gallons.

Send for illustrated literature on these machines

Interior of the new Telling Belle-Vernon plant at Wellington, Ohio, built by The Austin Company.

Modernize Your Plant for Low Cost Production

To modernize your plant is to materially reduce your operating costs and eliminate waste in many directions.

Many ice cream manufacturers are now investigating their present facilities with a view to cutting down their production and handling costs. They are studying plant layout, new kinds of equipment and the modern types of buildings. They recognize the competitive advantages that come from modern facilities.

It is in such a study of your present plant facilities that Austin engineers can offer constructive suggestions for improvement. They can apply 50 years of building experience to your problem and give you the advantage of the latest methods in engineering, building and equipment.

You can build now to advantage while building costs are low and your investment can be fully protected. Austin can help you whether you need an ice cream plant of reinforced concrete type, a new power house and its equipment or a steel-span garage. Consultation with Austin engineers involves no obligation. Phone, wire or use the coupon.

JUNE 1922

BULLETIN OF EVENTS

National Dairy Show, Minnesota State Fair Grounds, Minneapolis--St. Paul, Minn., October 7-14, 1922. W. E. Skinner, Secretary, Suite 222, 910 So. Michigan Ave., Chicago, Ill.

National Exhibition, Association of Ice Cream Supply Men, Cleveland, Ohio, October 16-21, 1922, headquarters Hotel Winton. Robert Everett, 1328 Broadway, New York, Secretary.

National Association of Ice Cream Manufacturers. 22nd annual convention, Cleveland, Ohio, Hollenden Hotel, October 16th, 17th and 18th. N. Loewenstein, 155 N. Clark Street, Chicago Secretary.

Southern Association of Ice Cream Manufacturers, annual convention, New Orleans, December 5, 6 and 7. J. W. Clopton, Secretary, Decatur, Ala.

IN THIS issue we present a Special Section devoted to the mixing, freezing and hardening of ice cream. The information contained in this Special Section of The Ice Cream Review has been gleaned from reports sent in by successful ice cream manufacturers the country over. What they have to say about mixing, freezing and hardening of ice cream should be of interest to every man in the business.

It is perhaps impractical to select one step among the many steps concerned with the production of ice cream and call it the most important. We believe it is generally agreed, however, that the mix determines the quality of the finished product if each mechanical operation gets proper attention. The story goes that a young bridegroom upon returning home found his wife in tears. She had tried to make mince pie and had miserably failed. She said, "I am afraid I have left something out." Upon tasting it the bridegroom remarked, "No, my dear, nothing you have left out would make mince pie taste like this." We have sampled ice cream with the resulting conviction that nothing left out of it would give it such a flavor.

It is probably true, however, that poor quality ice cream is generally caused by what is left out of it. Some of the ingredients that go into good ice cream are expensive and there is always a temptation to use them sparingly in the mix. A sufficient quantity of good materials, properly combined, will produce good ice cream if the maker has the right equipment and knowledge.

We have not attempted to discuss ice cream mixes in this issue, but rather to cover the mechanical operations in handling the mix. This very properly includes freezing and hardening of the ice cream. We believe that the experiences of practical men are of real value to others. If the information which we publish in this Special Section will help some of our readers in solving their factory troubles we shall feel well repaid for the effort we have expended in collecting this information. To the many ice cream manufacturers who have so splendidly co-operated with us in making this Special Section possible we extend our sincere appreciation.

COMPILATION of statistics furnished by over 100 ice cream manufacturers in all parts of the country, as published in the last issue of The Ice Cream Review, revealed some very interesting facts. For instance, the percentage of cans to be replaced annually ran all the way from one-half of one per cent to 40 per cent, the average being 20 per cent. Shall we say that the man reporting the 40 per cent is careless? That possibly would be doing him an injustice. It is probably due to the lack of a proper checking system. It goes without saying that his dealers are careless, but they can hardly be blamed if they are not checked up. They are human beings and if the man who owns the property is apparently little concerned about it why should they worry?

It is a mistake to think that the dealer appreciates a liberal attitude on the part of the ice cream manufacturers in relation to the return of empty cans and packers. Some manufacturers are afraid to install a good checking system because they think it will mean loss of business. It is a mistake. Business relations between manufacturer and dealer that are based on businesslike methods are more enduring than when based on slip-shod methods. When the dealer subscribes to a definite plan of conducting the business he has more respect for the other party involved and will have more confidence in him. He would rather do business in a businesslike way. The experiences of our most successful ice cream manufacturers bear out the truth of this statement. They have built up a big tonnage on quality and service, and their dealers know that SERVICE includes co-operation between both parties in conducting the business in a businesslike way.

A KANSAS ice cream manufacturer in writing us recently used these words, "We believe that it pays us to have the other fellow make good ice cream, as it is our idea that the industry must rise or fall together. If the other fellow makes poor ice cream he is helping to make some consumer dislike 'The National Dish' that we all make our living out of."

Our friend states a big truth, but it takes a big man to understand this. Probably most ice cream manufacturers like to see others make good ice cream, but they want them to live far enough away so that they don't really come in competition with them. It is a real big man who can honestly desire to have another ice cream manufacturer in the same town make good ice cream.

Our correspondent is right when he says that the way to develop the ice cream industry is to make more good ice cream. Take any town or city in the country where only good ice cream is put upon the market, and you will find a larger per capita consumption of ice cream than in towns and cities where part or all the ice cream is of inferior quality. This is true, providing the product has been properly advertised.

There are many ice cream manufacturers who are big enough to even help the competitor across the street to make better ice cream if they are able. This spirit of helpfulness and real understanding of the principles of promoting the industry is growing and men who have the best interests of the business at heart are doing all they can to promote it.

⚜

NO BUSINESS man can truthfully say that his particular business is different from other lines and therefore not affected by general economic conditions. The ice cream manufacturer depends upon a lot of favorable influences in order to secure the highest possible tonnage, but after all what is most important is the ability of folks, who want to eat ice cream, to buy it. Just to prove that our optimism is based upon more than "springtime influences" we quote from a bulletin recently issued by The Mechanics & Metals National Bank, of New York City:

"Quite apart from the unduly bright reports heard in business and financial circles, trade reviews are distinctly hopeful. Progressive gains in the volume of industrial output, combined with a continued accumulation of capital and credit, have found their reflection in a number of directions; in a greater employment of labor, for instance; in a strengthening of prices; in a better state of things on the railways; in a pronounced rise of security values and a broadened public interest in security trading; in a further easing of the situation with respect to the long-standing 'frozen loans.'

"Present indications point to sustained activity, even if they do not altogether encourage expectations of further large expansion. Nothing in the situation is perhaps so encouraging as the general belief that a bottom price level has been established, and that henceforward adjustments which are made will, on the whole, be in the nature of stabilization, with odds in favor of advances rather than declines."

WE ARE advised by General Manager Skinner that the word "Show" has fulfilled its usefulness in describing the big annual event staged by the National Dairy Association. Hereafter it will be bad form to speak of the National Dairy Show. You must say "National Dairy Exposition." It may be hard for some of the old timers to take up with this change all at once, but they will learn in time. We believe this is a good change. This big annual event in the dairy world is more than a show. It is a real exposition of the greatness and importance of the dairy industry and is rightfully entitled to be known as the National Dairy Exposition.

⚜

THE man who makes a success of advertising advertises when business is poor in order to make it better. When business is good he advertises to make it still better. On the other hand some advertisers stop advertising when business is poor because they think there is no chance of making it better. These are the same fellows who stop advertising when business is good because they have all the business they can take care of. Such folks are just kidding themselves. They are not successful advertisers. Instead of profiting by the experience of successful advertisers they just let their peculiar notions dictate their policies. They don't know the first principles of successful advertising.

⚜

OUR readers will be interested in the several communications in this issue from the boys on the road who give their views regarding prospects for the season's business. These men are in close touch with the men who make ice cream and we know of no better authority. The note of optimism which permeates these reports makes them pleasing to read and should do much to dispel the feeling of uncertainty which has prevailed for so many months among business men. We are indebted to these men for sending us these reports, and we hope that others will be prompted to write us.

⚜

THE men in charge of publicity for the big doings in Cleveland next October are putting in some good licks and if there is an ice cream manufacturer who will not have learned all about the Cleveland exposition and meeting long before Oct. 16-21 it will be because he does not understand the English language. The boys on the road are backing up the work of the officials in splendid shape through their organization, the Salesmen's Club.

ARE you making use of the service offered through the National Dairy Council in your advertising plans? They have some valuable literature devoted exclusively to ice cream. Write the National Dairy Council, 910 S. Michigan Ave., Chicago, Ill., and tell them your problems.

What Causes a Hollow Space in Cans of Ice Cream

Question Asked by a Subscriber and Suggestions for Prevention

ANSWERS to this question, which was taken up in The Ice Cream Review for May, continue to arrive, and we are publishnng a few of these late ones that seem to cover the various angles of the subject:

Question:—We have had a number of complaints recently from several of our customers in regard to our cans not being full. They say the cans appear to be filled to capacity upon arrival, but after serving a few customers they find a hollow space in the middle of the can which varies from one-half to two gallon shortage in a five gallon can.

Our mix is 9.00 fat, 34.50 total solids, and we get 100 per cent overrun and great pains are taken in drawing the cream from the freezer to see that it is not drawn too fast which might cause air pockets in cans. Are there any causes other than too low solids, too much overrun or carelessness in drawing cream from freezer that would tend to make hollow cream. Please give us all the information possible.

* * *

Excessive Overrun; Frozen Too Stiff.

Reply: We have never experienced any trouble of this kind, especially where a hollow space developes in the center of the can. But I can see that if an excessive overrun was taken, and if the cream was frozen too stiff that it would be possible to develop air holes in filling the cans. It sometimes happens that the ice cream will shrink in the can, going down sometimes three inches in the top and I believe this condition can be traced to the improper use of gelatine or using an insufficient amount. This condition also, of course, will happen where an excessive overrun is taken.

* * *

Freezes Too Hard.

Reply: I believe one cause for the difficulty mentioned is that the ice cream is drawn from the freezer too hard. We would suggest that the party mentioned should insert a thermometer in the port hole of the freezer and draw this ice cream at a temperature of approximately 26 degrees, or, in other words, let the freeze brine on until a temperature of 26 degrees is noted and then turn off the brine and take the overrun.

It might also be that if this party would use a higher grade of gelatine that he would find a great deal of this trouble eliminated. Sometime ago I had occasion to have a consumer's complaint brought to my attention, but his trouble was that the ice cream can appeared to be full, but that after it had been delivered and had been in the store for some time, that it dropped 3 or 4 inches from the top. This party, after switching on high grade gelatine and somewhat raising the total solids of his mix, had no further trouble.

I note that you say there is sometimes a shortage of two gallons to a 5 gallon can. Upon the face of it I would say that this is absolutely impossible because if only 100% overrun is taken and ordinary care is exercised in the freezing, a condition of this kind could not exist.

* * *

Wrong Packing a Possibility.

Reply: The writer of this question asks if there are any other causes besides too low solids, too much overrun or carelessness in drawing the cream from the freezers that would cause this. The following seems to me to be a possible explanation, especially if the overrun is about the maximum which the mix will stand. It would seem that in packing the ice cream they might not be putting enough salt in the lower part of the tub which would allow the temperature to rise, thereby causing the ice cream to melt and shrink. The upper portion would not shrink because sufficient salt had been added to keep the temperature low near the surface. I have not had any experience with this, but this seems to be a possibility.

* * *

Homogenizing Pressure High.

Reply: I wish to state that it is rather difficult to answer the question which this manufacturer asks, without being able to see the condition, but it sounds as though it was a case of too high homogenizing pressure. A number of years ago it was thought that a high pressure of 3,000 pounds was necessary to properly homogenize an ice cream mix, but we know now that a perfectly smooth ice cream can be made with considerably lower pressures, say around 1,500 pounds. In fact, 3,000 pounds is detrimental under some conditions, since it breaks the structure of the casein in the mix, thus weakening the body. I have known of occasions of this kind where it was necessary to reduce the pressure to as low as 1,000 pounds. Of course, I don't know whether this manufacturer is even homogenizing, but offer this as one of the possibilities which might cause his trouble.

* * *

Lacks Viscocity.

Reply: We have never met with this difficulty. Quite often ice cream will sink in the can, but we have never heard of it sinking to the degree of two gallons to a five gallon mix. I am inclined to think that the trouble is due to the kind of mix they are using, for I am somewhat familiar with the ingredients used in southern ice cream. They are probably using a considerable quantity of milk powder, homogenizing in the fat, and aging for but a very short time. It is this that induces viscosity or stickyness in the mix. Unless a mix has viscosity, it will not retain the swell. For comparison, we might say that 100% swell can be put in ice cream made out of skimmilk but the air whipped in cannot be retained on account of the lact of viscosity. To overcome this difficulty, in case this should be the cause, they would freeze the ice cream fairly hard before drawing. It should also be well to use some ice cream smoothener, or gum in connection with the gelatine. Aging of mix also improves the viscosity. The can should be set in the cooler as soon as drawn. * * *

The shrinkage of the ice cream after hardening is usually due to one or more of the following causes:

1. Improper composition of mix, particularly the use of too much sugar.
2. Too high temperature in the hardening room, which allows the air to escape from the plastic ice cream before the same is hardened.
3. Drawing the ice cream from the freezer while at too soft or too high temperature. In this condition the cell walls are not sufficiently rigid to hold the enclosed air.
4. Too high overrun.
5. The use of insufficient gelatine or an improper quality of gelatine.

We Are Producing More Ice Cream Cans A Day Than Any Can Factory In The United States

DO YOU NEED Electric Weld ICE CREAM CANS?

TRADE MARK REG.

IF SO, WIRE YOUR ORDER AT ONCE

PATENTED.
The Electric Weld Ice Cream Can.

No Solder No Rivets = NO LEAKS

WE GUARANTEE to replace any Electric Weld can which in ordinary service—

1. Breaks at the welded joints.
2. Leaks during the life of the can, not only when new, but as long as the can is in use whether it has been retinned or not.
3. Opens at the bottom joint.
4. Shows defective workmanship or material.

WE ALSO GUARANTEE that Electric Weld Cans

1. Are hand dipped in pure Straits tin with an average coating of an ounce and a quarter per square foot of surface.
2. That we do not use solder, lead or rivets.
3. That they can be retinned successfully without using solder or in any way changing the construction.
4. That we use special hard finish steel sheets which are best for tinning and offer unusual resistance to blows, wear and tear.
5. That the capacities are correct on each size within the tolerance permitted by each State.
6. That our covers are interchangeable with standard makes of cans.
7. That no annealing of the can takes place which would soften the metal; our cans permit using the steel in its original hardness without changing, softening or destroying its original structure.
8. That we use full standard gauge material and do not add to the weight with unnecessary re-inforcements.
9. That Electric Weld cans are "water tight" before tinning and remain so always.

THE ASSOCIATION OF ICE CREAM SUPPLY MEN
MEMBER

Electric welded cans can be retinned at a saving of 20% over soldered cans!

CAN SERVICE AT LOWEST COST

JOHN WOOD MFG. CO. Conshohocken, Pa.

CHICAGO OFFICE (320 E. North Water St.) CLEVELAND OFFICE (2041 Warren Rd., Lakewood, O.) BOSTON (60 Pemberton Sq.)
BROOKLYN (No. 5 Bush Terminal Bld.) OAKLAND, CAL. (335 Cypress St.)

Reply: This condition is caused by too high an overrun and too low a solid content. It may also be caused by a poor filler when too much overrun is obtained.

* * *

Reply: I have been making ice cream for ten years and this has never happened to me, but I think they use too much gelatine and powder. Possibly they freeze too quickly and hard before they draw, or they get more overrun than they think. One great trouble with a great many ice cream men is that they look for and try to get too much overrun.

* * *

Reply: Our men do not have any of the difficulties that this manufacturer mentions. With his solids at 34.50 and fat at 9, it seems that he must be getting more than his share of overrun.

* * *

Reply: It is our opinion that this manufacturer is getting more than a 100% overrun, and such a condition is causing his trouble. The mixture of 9% fat, 34.50 total solids, seems to correspond correctly with an overrun of 100%.

⚜

DESERT PILGRIMS GIVEN ICE CREAM BASEBALLS.

During the Mystic Shrine, International Rotary and National Real Estate conventions in Los Angeles and San Francisco recently, 5,000 delegates to these conventions who stopped over in El Paso to see Old Mexico, were given Chocolate Coated Baseballs complimentary of the Elite Chocolate Coated Baseball Co.

At the banquets and luncheons in El Paso given these delegates who crossed the continent on 15 special trains, Baseballs were served as a novel dessert and moving pictures made of the pilgrims eating this frozen confection. Post cards were also furnished the visiting delegates to be mailed back home, which were redeemable in Baseballs at their home-town confectionery.

As a feature stunt the chairman of each of these special train delegates was given a regulation league baseball, with the compliments of Babe Ruth himself, who wrote his name on the horse-hide of each ball. These league baseballs are to be kept by the various organizations as souvenirs of their visit to El Paso, the home-plate of chocolate coated Baseballs.

KRYL & EICHELMAN ESTABLISH AS STEEL FABRICATORS.

A new interesting partnership has been established in the Chicago market between J. M. Kryl, present president of the Kryl Bridge and Crane Works, Chicago, and W. H. Eichelman, until recently chief engineer of the Hamler Boiler & Tank Co., of Chicago.

Both men are graduate engineers of considerable experience in fabricating steel plate and structural iron with present facilities for handling water tanks, oil tanks, stacks, process kettles of all kinds for chemical equipment, ornamental iron and structural steel.

⚜

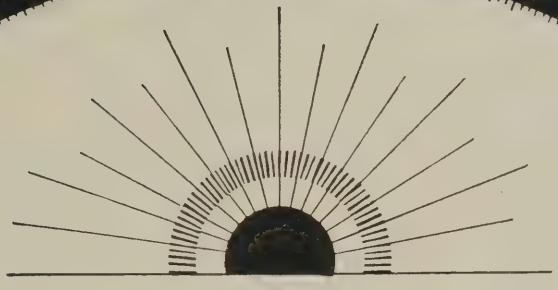
GERMAN FIRM TO ENCOURAGE ICE CREAM MAKING..

A letter from Ringe & Kuhlman, Hamburg, Germany, announces that they are making a determined effort to popularize ice cream and ice cream making in that country. They will specialize in the installation of ice cream manufacturing equipment.

BABE RUTH KNOCKS HOME RUN WITH CHOCOLATE COATED BASEBALLS.

"Babe" Ruth, King of the Land of Swat, has knocked out another hit. The batting Bambino of the New York Americans is now lending his name, face and fame to the Elite Chocolate Coated Baseball Co., in the interest of this chocolate coated ice cream confection which is sweeping the country.

Recently "Babe" Ruth and his teammates of the Americans posed for the movie camera men, all eating chocolate coated baseballs, and registering delight with every bite. The Bambino is now vice-president of the Elite Baseball Company, which is distributing these two-flavor frozen confections nationally. In addition Ruth is redeeming the wrappers of Baseballs with a regulation league baseball with his signature on the horse hide. These are proving immensely popular with the sand lot kids who are saving their wrappers after wrapping themselves around a chocolate Baseball.



The history of this ice cream novelty is one of the most interesting in the ice cream trade. Out in El Paso, Texas, on the Mexican border, Milton H. Barrough, General Manager of the Elite Confectionery Company, the leading confectionery in that city, had been conducting a series of experiments and running tests on a frozen dainty the shape of a regulation league baseball. The ice cream was chocolate and vanilla and the coating bitter-sweet chocolate. Wishing to get the reaction of the patrons of his ice cream parlor to this new confection, he made it a leader on his list of fountain specials one hot day.

From Fort Bliss, near El Paso, came a squad of desert-weary U. S. cavalrymen on "shore leave." Wishing to get the alkali desert dust out of their throats, and something cooling in their stomachs, each ordered a chocolate coated Baseball. And each called for an encore. That summer baseballs were the most popular dish for the soldiers on Mexican border duty. When these soldiers returned to the east and north, they carried the fame of baseballs with them and several had shipments made to them at their homes.

Then a big league baseball team passed through El Paso on a barn storming trip from California. After the game, which was played on a hot afternoon, they went to the Elite for refreshments. The word "Baseball" attracted their attention. They ordered a round of these novel ice cream balls. They made a hit with the ball players, and when a banquet was given in New York for the winning team in the pennant contest, the manager wired Mr. Barrough to ship enough Baseballs for the dessert at that banquet.

The demand for these chocolate coated Baseballs having grown so rapidly, a separate company was organized to distribute them nationally. Royce G. Martin, capitalist, was made president; J. E. Benton, M. H. Barrough and Paul Thomas were the other organizers. Contracts were made for having the aluminum moulds made in wholesale quantities, foil wrappers were designed and ordered in large quantities from the manufacturers ready to deliver to manufacturers as needed, and a national advertising campaign to spend $200,000 planned and is now being carried out.

While in New York on business connected with these details, President Martin obtained the exclusive use of "Babe" Ruth's picture and signature for use in advertising the Chocolate Coated Baseball. The result has been that Babe Ruth Home Run Baseballs are now known wherever the famous Home Run King is known, and "Say Baseball" is fast becoming the national buy-word.

ESKIMO PIE

TRADE MARK REGISTERED

Won! The first flagrant infringer of the Eskimo Pie patents has been enjoined by a Federal Court—the honest right of the inventor has been upheld. And the way is clear for still greater successes with this phenomenal ice cream product. Russell Stover Company, 5 North Wabash Ave., Chicago.

IT IS EASIER TO GIVE ADVICE THAN TO LEND A HAND.

Another Method of Standardization of the Ice Cream Mix*

By RUSSELL T. DES JARDINS, A. B., Chemist, RALPH A. FORTIN, Mix Superintendent,
Crane Ice Cream Company, Philadelphia, Pa.

THE following material is offered as the basis of another method of Standardization of the Ice Cream Mix. This method is based upon the principle of a "Key Mix" composed of the most desirable of highly concentrated dairy products. The key mix uses two ingredients as the source of the milk fat and the serum solids required in the mix. The source of milk fat is 40 per cent cream, containing a large proportion of milk fat and a small proportion of serum solids. After the quantity of heavy cream required to furnish the milk fat is determined; the quantity of serum solids in that amount of cream is computed. This quantity of serum solids is then deducted from the quantity of serum solids required in the whole mix, and condensed skimmilk composed entirely of serum solids and water, is used as the source of the balance of the serum solids.

The necessary quantities of sugar and gelatine are added, and the balance of the mix is made up of water.

This furnishes the basis of the key mix. The next step is to substitute in this key mix, definite quantities of other dairy products in place of fixed proportions of the cream, condensed and water used in the key mix.

Composition of Materials Used.

40% Cream. 40% Fat. 5.35% Serum Solids.

Plain condensed skimmilk, 28% serum solids, whole milk, 4% fat, 8.64% serum solids, butter 84% fat, sweetened condensed skimmilk, 28% serum solids, 40% sugar, sugar, 100% total solids, gelatine, 100% total solids.

Formula No. 1. Basic.

Ingredients	Pounds	% Fat	%S. S.	% Suger	%T. S.
Fat	12.00	12.00	.....	.....	12.00
Serum Solids	10.00	.....	10.00	.....	10.00
Sugar	12.00	.....	.....	12.00	12.00
Gelatine	.50	.....	.....	.....	.50
Mix	100.00	12.00	10.00	12.00	34.50

The basic formula is identical with that used by Prof. Olsen in his article in the May issue.

Formula No. 2.

In which 40% cream furnishes the butterfat and a portion of the serum solids.

Ingredients	Pounds	% Fat	%S. S.	% Suger	%T. S.
Cream	30.00	12.00	1.60	.....	13.60
Serum Solids	8.40	.....	8.40	.....	8.40
Sugar	12.00	.....	.....	12.00	12.00
Gelatine	.50	.....	.....	.....	.50
Water	49.10	.....	.....	.....	.....
Mix	100.00	12.00	10.00	12.00	34.50

40 per cent cream is calculated as 40 per cent fat and 5.35 per cent serum solids.

The amount necessary to supply 12 pounds of fat, is then:

$$\frac{12}{40} \times 100, \text{ or } 30 \text{ lbs. of } 40\% \text{ cream.}$$

This quantity of cream contains: 5.35% of 30 pounds, or 1.60 pounds of serum solids. Leaving a balance of 10.00—1.60, or 8.40 pounds of serum solids to be made up from some other source.

Enough water is added to bring the total mix to 100 lbs.

Formula No. 3. Key Mix.

In which condensed skimmilk with 28% serum solids furnishes the balance of the serum solids of the mix.

Ingredients	Pounds	% Fat	%S. S.	% Suger	%T. S.
40% cream	30.00	12.00	1.60	.....	13.60
Condensed	30.00	.....	8.40	.....	8.40
Sugar	12.00	.....	.....	12.00	12.00
Gelatine	.50	.....	.....	.....	.50
Water	27.50	.....	.....	.....	.....
Mix	100.00	12.00	10.00	12.00	34.50

Condensed skimmilk is calculated as 28% serum solids. The quantity necessary to supply 8.4 lbs. of serum solids is:

$$\frac{84}{28} \times 100, \text{ or } 30 \text{ lbs. of condensed skimmilk.}$$

This formula carries the name Key Mix, since from this formula all substitutions are made.

Formula No. 4.

In which butter is substituted for all of the cream.

Ingredients	Pounds	% Fat	%S. S.	% Suger	%T. S.
Butter	14.29	12.00	.....	.....	12.00
Condensed	35.73	.....	10.00	.....	10.00
Sugar	12.00	.....	.....	12.00	12.00
Gelatine	.50	.....	.....	.....	.50
Water	37.48	.....	.....	.....	.....
Mix	100.00	12.00	10.00	12.00	34.50

The basis of the substitution in this case, is the fact that:

47.62 pounds of 84% butter.
19.10 pounds of condensed skimmilk.
33.28 pounds of water

is equivalent to 100 pounds of 40% cream. This information is gained in this way: 100 pounds of 40% cream contains: 40 pounds of butterfat, 5.35 pounds of serum solids. Then we will need as much butter as:

$$\frac{40}{84} \times 100, \text{ or } 47.62 \text{ lbs. of butter.}$$

We will also need 5.35 pounds of serum solids, since butter is deficient in this constituent. We will use condensed skimmilk for these serum solids. We will need:

$\frac{5.35}{28} \times 100$, or 19.10 lbs. of condensed skimmilk. The balance of the 100 pounds will be water. Therefore: 100 pounds of 40% cream is equal to

47.62 pounds of butter,
19.10 pounds of condensed skimmilk, and
33.28 pounds of water.

Formula No. 5.

In which whole milk testing 4% fat and 8.64% serum solids is substituted for water and a portion of the milk fat and serum solids. Reference is to the Key Mix.

(NOTE—Actually 4% milk contains only 8.55% serum solids. We have, in this case used Prof. Olsen's figure of 8.64% serum solids.)

Ingredients	Pounds	% Fat	%S. S.	% Suger	%T. S.
40% cream	25.50	10.20	1.36	.....	10.54
Condensed	16.97	.....	4.75	.....	4.75
Milk	45.03	1.80	3.89	.....	5.69
Sugar	12.00	.....	.....	12.00	12.00
Gelatine	.50	.....	.....	.....	.50
Mix	100.00	12.00	10.00	12.00	34.50

One hundred pounds of 4% milk contains:

4.00 pounds of milk fat.
8.64 pounds of serum solids.

Four pounds of milk fat is equivalent to the milk fat contained in:

$$\frac{4}{40} \times 100, \text{ or } 10 \text{ lbs. of } 40\% \text{ cream.}$$

The balance of the 100 pounds of milk or: 100 — 10 pounds, or 90 pounds is skimmilk testing 8.91% serum solids.

8.91% of 90 pounds is 8.019 pounds of serum solids present. We have, however, used Prof. Olsen's figure based on 8.64% serum solids in 4% milk. This gives a somewhat higher figure for the serum solids, of 8.10 pounds.

8.10 pounds of serum solids is equivalent to the serum solids contained in

$$\frac{8.1}{28} \times 100, \text{ or } 28.93 \text{ lbs. of condensed skimmilk.}$$

The balance of the one hundred pounds, or 61.07 pounds is water.

In other words: Every 100 pounds of whole milk used in a mix, will replace in that mix:

10.00 pounds of 40% cream.
28.93 pounds of condensed skimmilk.
61.07 pounds of water.

GOLDEN STATE Powdered Skim Milk & high score sweet butter—or better still, GOLDEN STATE Pure Milk Fat is the combination for an ideal Ice Cream mix.

CALIFORNIA CENTRAL CREAMERIES INC.

175 FRANKLIN STREET - NEW YORK CITY

SAN FRANCISCO CHICAGO LOS ANGELES

We wish to replace 27.50 pounds or 0.275 hundred-weight of water (Cf. Key Mix). Therefore we must use:

$$\frac{0.275}{61.07} \times 100 \text{ or } 45.03 \text{ lbs. of milk.}$$

When this quantity of milk is added to the mix, we must omit from that mix:

0.4503 × 10.00 lbs. or 4.5 lbs. cream
0.4503 × 28.93 lbs or 13.03 lbs. condensed.
0.4503 × 61.07 lbs. or 27.50 lbs. water.

If the correct factor, of 8.55% serum solids is used. We must add to the mix:

$$\frac{0.275}{61.36} \times 100 \text{ or } 44.82 \text{ lbs. of milk.}$$

and must omit:

0.4482 × 10 lbs. or 4.48 lbs. cream.
0.4482 × 28.64 lbs. or 12.84 lbs. condensed.
0.4482 × 61.36 lbs. or 27.50 lbs. water.

Formula No. 6.

In which sweetened condensed skimmilk replaces the condensed skimmilk. Sweetened condensed skimmilk tests 40% sugar and 28% serum solids.

Ingredients	Pounds	% Fat	%S. S.	% Suger	%T. S.
Cream 40%	30.00	12.00	1.60	.....	13.60
Sweetened Cond. Skimmilk	30.00	.....	8.40	12.00	20.40
Gelatine	.50	.....	.....	.....	.50
Water	39.50	.....	.....	.....	.....
Mix	100.00	12.00	10.00	12.00	34.50

100 pounds of sweetened condensed skimmilk contains:
28 pounds of serum solids.
40 pounds of sugar.

This is equivalent to:

and $\frac{28}{28} \times 100$ or 100 lbs. of condensed skimmilk.

and $\frac{40}{100} \times 100$ or 40 pounds of sugar.

In other words, for every 100 pounds of sweetened condensed skimmilk used in the mix, we must omit an equal quantity of condensed skimmilk and 40 pounds of sugar. and must add to the mix an additional 40 lbs. of water.

In this case we wished to replace all of the condensed skimmilk. Therefore we added to the mix

0.3 hundred-weight × 100 or 30 lbs sweetened condensed skimmilk, and

0.3 hundred-weight × 40 or 12 lbs. of water and left out of the mix:

0.3 × 100 or 30 lbs. of skimmilk condensed and
0.3 × 40 or 12 lbs. of sugar.

It happens in this case, that the total quantity of sweetened condensed needed is just sufficient to provide all of the sugar needed in the mix. If only one-third of the condensed skimmilk were to be replaced, the procedure would be the same. Adding to the mix

10 lbs. of sweetened condensed skimmilk.
4 lbs. of water.

and omitting:

10 ibs. of condensed skimmilk and
4 lbs. of sugar.

This method may be amplified in such a manner as to simplify the use of any known dairy product in the production of ice cream mix. It has been in use in this plant for a period of years and during that time, no case has developed, in which this method would not give the desired results quickly and easily.

Moreover the method requires only a knowledge of dairy products and the simplest of arithmetic for successful operation.

Tell us what you want, or what you have that you don't want, and we'll fix up a little Ad for you and insert it in the next issue of The Ice Cream Review.

NEBRASKA ASSOCIATION OF ICE CREAM MANUFACTURERS.

Secretary's Office—Rooms 720-721 Terminal Building Lincoln, Nebraska.

To Members: We are now compiling New Credit list for 1922. Will you please go over your accounts and send me list as per the classification below and will include in my new list.

R. W. McGINNIS, Sec.-Treas.

Class I. Ice cream buyers who are slow to pay and only when pressed.

Class II. Customers who make unwarranted claims for credits and are inclined to be fault-finding and technical.

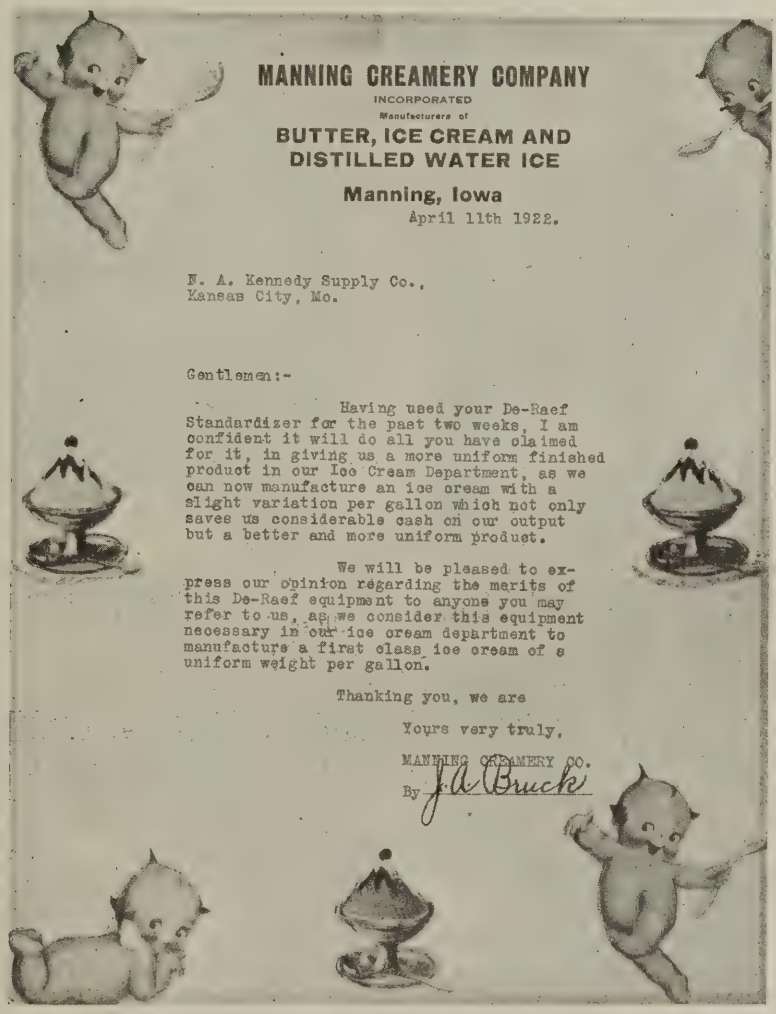
Class III. Dealers who get behind with manufacturers, start buying of others and cause extra expense to make collections.

Class IV. Parties who are in business only during the summer season, buy of one manufacturer as long as possible on credit, then change to another and by the end of the season have purchased all over and paid no one, should be put on the C. O. D. or cash basis.

Class V. Dealers who refuse C. O. D. shipments, permit the cream to be returned, express charges both ways, should be classed as hazardous risks, and be supplied only when cash accompanies their orders.

* * *

Report of your customers coming under any of the above classes should be sent in promptly on the **first** of each month to R. W. McGinnie, secretary, Rooms 720-721 Terminal Building, Lincoln, Nebraska. In order to make the system a success and of the most benefit to all concerned, the information should be given with care, and by getting these reports to the secretary on time, it will enable him to get the information into the hands of the manufacturers promptly and thereby place them in a position to protect themselves.



⚜

PERSONALS.

James W. Stanley, whom we immediately remembered when he told us that we ate a good share of his ice cream at the National Dairy Show in 1921, was a welcome visitor at The Ice Cream Review office on June 5th. Mr. Stanley was, at that time, making carbonated ice cream for the Heathmade Carbonated Products Company, of Chicago. He is now connected with the Sethness Company, Chicago, who specialize in food colors, preserved fruits and flavoring extracts. Mr. Stanley travels extensively, acting in the capacity of ice cream specialist.

N. A. Kennedy Supply Co.,
Kansas City, Mo.

Gentlemen:-

Having used your De-Raef Standardizer for the past two weeks, I am confident it will do all you have claimed for it, in giving us a more uniform finished product in our Ice Cream Department, as we can now manufacture an ice cream with a slight variation per gallon which not only savee us considerable cash on our output but a better and more uniform product.

We will be pleased to express our opinion regarding the merits of this De-Raef equipment to anyone you may refer to us, as we consider this equipment necessary in our ice cream department to manufacture a first class ice cream of a uniform weight per gallon.

Thanking you, we are

Yours very truly,

Bulletin No. 54, by the Secretary.

N. LOEWENSTEIN, Secretary
155 North Clark Street Chicago, Illinois

Tariff on Salt.

The pending tariff bill now before the Senate levies an import duty on salt as follows:

If in bags or barrels, 20c per hundred pounds, which is equal to $4 a ton; if in bulk, 16 cents per hundred pounds, which is equal to $3.20 a ton.

A HAND-OUT FROM NAT. 1921 REPORTS ARE OUT.

If the tariff bill passes carrying this duty on salt, it will undoubtedly mean a considerable advance in the price of that commodity to ice cream manufacturers, particularly to those located near the seaboard, where inland freight would not be a great factor.

At the present time there is no duty on salt imported into this country.

Members are requested to communicate immediately with their Senators and Congressmen at Washington, calling their attention to the fact that the salt industry in this country does not require protection and that the only effect of such protection may be to increase the price of salt. Impress upon them that you stand for either a substantial reduction in the duty or that salt be permitted to remain, as at present, on the free list.

1922 Membership List.

Copy of our 1922 membership list is herewith enclosed. It is requested that, by reference to this list, you ascertain the names of members of the Association in your locality and then endeavor to interest manufacturers who are not members. Impress upon them the many advantages such membership holds for them, some of which are set forth in the enclosed pamphlet. Application blanks will be forwarded promptly to any names that you may send to this office.

Uniform Cost Accounting System.

An additional supply of Cost Accounting forms has been printed and we respectfully request all members who are not now using this uniform system to adopt it at the earliest possible date. You will, of course, appreciate the fact that the more firms that use the system the greater will be its value to the industry.

The Cost Accounting Committee has made some slight changes in the forms, so that the new edition will be even more complete than that used heretofore.

Eighty-four sheets—or one set of forms, sufficient for a year's business—are furnished at cost, $3.50. Orders sent to the Secretary's office will be taken care of promptly.

Depreciation Questionnaire.

Some time ago a questionnaire asking for your figures on depreciation was mailed to all members. Some of the members have not filled out these questionnaires and returned them as yet. To be of real benefit, it is necessary that a sufficient number of questionnaires be sent in to be representative of the industry.

If you have not filled out your questionnaire will you please do so at once and send it to Mr. S. T. Nivling, Chairman of the Cost Accounting Committee, Rochester Ice Cream Co., Rochester, N. Y.

* * *

Advantages of Membership.

Every live, progressive ice cream manufacturer will identify himself with the National Association of Ice Cream Manufacturers after he has given careful consideration to the following more important reasons why he should do so:

Because it unifies and represents in a national way the constantly expanding ice cream industry.

Because it bands together for mutual protection and advantage more than 75% of the manufacturers of ice cream in this country.

Because it keeps in constant touch with all important legislation—State and National—and takes prompt action in connection therewith where such action is required.

Because in the matter of express rates and service, the National Association is constantly on the alert to correct conditions inimical to the industry. In the recent express contest before the Inter-state Commerce Commission, through the efforts of this Association a saving was effected of 4c each on returned empties, or approximately $400,000 annually. The express situation is being carefully watched and in due time further action will be taken in this connection to protect the interests of the industry.

Because it furnishes to its members authentic information on all matters of importance to them. When the 1921 revenue bill is passed, members of the National Association will be advised promptly with respect to portions of it of interest to them, with particular reference to the tax on ice cream imposed under Section 630 and new income tax rulings.

Because it does for its members many of the things they would have to do for themselves, at their own expense, if they would continue to exist, and it does them at a far less cost and more effectively than could be done by any individual concern. An outstanding example of this is the recognition afforded the industry during the war, when, as a result of the work of members of this Association, ice cream was classified as an essential industry in the distribution of sugar.

Because all branches of the government are willing to co-operate cheerfully with trade associations, particularly if they represent, as in the case of the National Association, a large per cent of the industry. At the instance of this Association, the Department of Agriculture has been for some time past and is now conducting research work on ice cream and is making important strides in discovering the cause of sandy crystals.

The Association has also about a dozen standing committees working on problems of greatest interest, of

Nelson (Patented) Ice Cream Cabinets

"Confessed The Best When Put to Test"

are constructed along scientific and practical lines to conserve ice and salt supplies and keep the ice cream in perfect condition until sold. The manufacturers have devoted thirty years of study and experiment toward the building of the best possible ice cream cabinets for the manufacturing trade. Each particular make of cabinet of the Nelson line is sold with a guarantee and on a plan of "You Must Be Satisfied"

Three Compartment Cabinet

42 Qt. Brick with Ice Rail
Patented Nov. 11, 1919 1321120

Brick Cabinet
Also for Eskimo Pies

This Proposition Will Interest You

Any responsible ice cream manufacturer—particularly wholesale ice cream manufacturers and dealers—may order from 1 to 100 Nelson patented Ice Cream Cabinets, place them in practical use, and after 30 days, if not entirely satisfactory, return at our expense for freight, both ways.

Can any manufacturer offer a more liberal or fair proposition? You owe it to yourself to thoroughly investigate the price, merits and construction of the Nelson Patented Ice Cream Cabinets before making any further purchase.

Plan on your season's requirements now, and have your supply on hand when needed.

GREAT ICE CREAM BOOM IS PREDICTED IN ENGLAND.

The greatest boom in ice cream ever experienced in England is due to begin as soon as warm weather comes, reports "The Daily Mail" of London.

Offices will have ice cream soda fountains on every landing, and men will go out for their iced drink or their banana split with even greater frequency than nowadays they seek their cups of tea or their glass of beer. England is, in fact, to become the rival of America on the question of anything and everything to do with ice cream.

Several firms of American origin are at present represented in this country, and they are making their plans at top speed for launching this avalanche of ice cream on the British public. Their object is to make the food as regular a feature of diet as milk or bread. The "hokey-pokey" man will call with his wares just as the milkman or the baker calls at every home at the present time.

"The invasion has been threatened for two years," said A. Pompa, the secretary of the Ice Cream and Refreshment Traders' Federation, to a "Daily Express" representative. "It is really coming this year. I know of three firms who are pushing the scheme all they can.

"America consumes about two hundred and fifty million gallons of ice cream a year, and it is thought that the food—for it is a food—will prove equally popular over here when it is put on the market on a great scale."

VALUE OF DAIRY PRODUCTS IN THE UNITED STATES.

Department of Agriculture.

Total dairy products 1921 worth $2,410,000,000. The 1920 census reports 31,886,378 head of dairy cattle. Estimating their worth at $50 per head we have a dairy stock valuation in the United States of $1,569,318,900. Total of dairy products and cattle, $3,979,318,900. We can say that dairy products and cattle are worth about $4,000,000,000.

There were reported in the 1920 census pure-bred dairy cattle as follows:

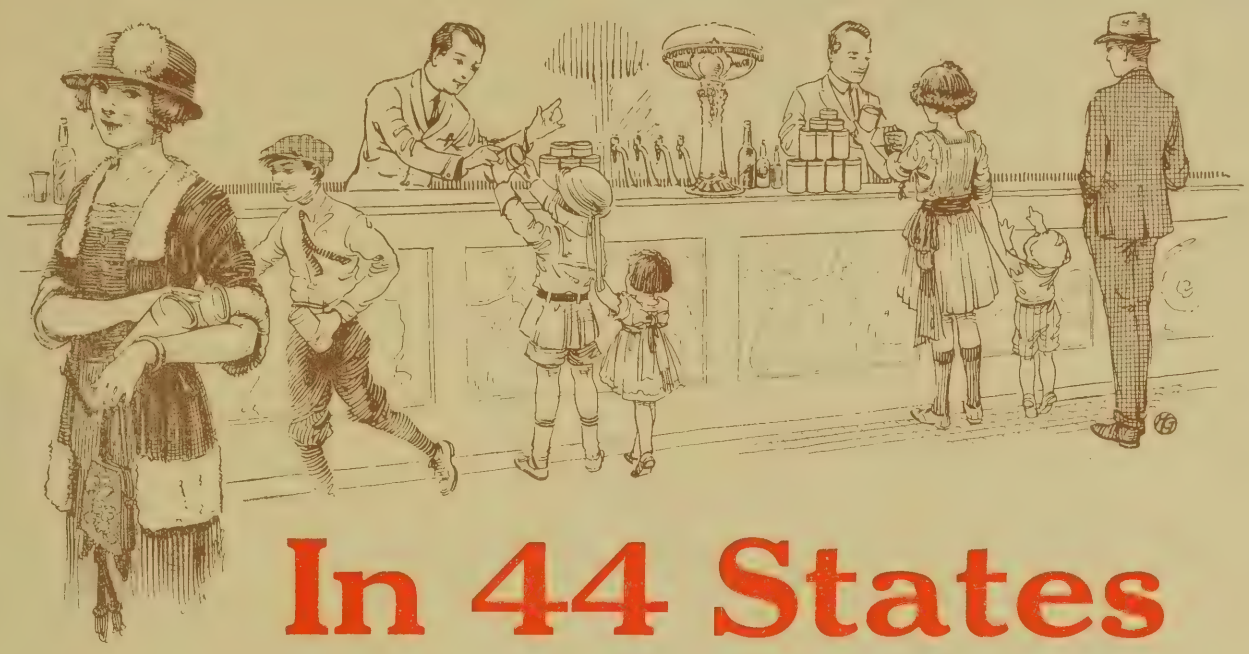
Ayrshires	30,494
Brown Swiss	8,130
Guernseys	79,445
Jerseys	231,834
Holsteins	528,621
Other breeds	38,078
Total	916,602

This represents only about 3% of the total listed dairy cattle. What an opportunity for the pure-bred breeders. Of these 31,000,000 dairy animals at least 23,000,000 are producing cows.

Milk production and its use. Total milk produced in the United States, 89,658,000,000 pounds, used as follows:

Used as milk	43.5%
Used as butter	36.0%
Used as condensed	4.4%
Used as cheese	4.0%
Used as ice cream	4.0%
Fed to calves	3.8%
Waste and other uses	3.2%

IOWA ASSOCIATION OF ICE CREAM MANUFACTURERS.



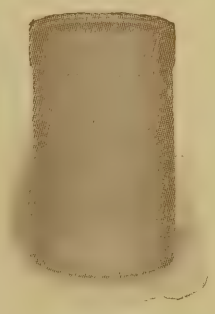
Report by Secretary P. W. Crowley.

In view of the work that has been done along educational lines for the purpose of stimulating the consumption of ice cream, manufacturers are somewhat disappointed with the output of cream for the month of April. However, there is really no justification for this feeling, as April was a very cold month, comparatively speaking. The report of the make of ice cream for April, as compared with April a year ago, increased only 4%, but as compared with the month of March, April increased 49.4%.

At the present time the association is working with its members along the line of securing a closer co-operation toward the elimination of the practice of furnishing country dealers with ice cream cabinets. During the last year or so this practice has been gaining some headway, but we hope to work out a plan whereby it may be gradually eliminated.

The matter of extension of credit to country customers is also receiving a fair share of attention, and it is to be hoped that we can eventually have classified the customers in the country who have taken advantage of ice cream manufacturers in securing unwarranted credit.

You can find the person who will be glad to buy what you wish to sell, by letting your desires be known through an advertisement in The Ice Cream Review.



In 44 States

Folks are "carrying-home" more good, old-fashioned bulk ice cream from retailers than they have ever done before. Two outstanding factors are: (1) People have always preferred and still do prefer bulk ice cream. (2) Bulk Ice Cream is now obtainable in a perfect, satisfactory Package-Form, and the cream keeps in perfect condition all the way home.

In 44 states—the "Sealright-Way" has been adopted, to-wit: Sealright Filling Machines, Sealright Liquid-Tight Paper Containers, and a Merchandising and Advertising Plan—complete, comprehensive, practical.

Bulk Ice Cream—not Brick

Give the public what it most desires—bulk ice cream, and package it in an attractive, efficient, sanitary, economical and satisfactory manner, and there'll be more "carry-home" sales. That's what the "Sealright-Way" does. Naturally, its adoption is already national.

It Will Be to Your Interest to Get Full Details on the "Sealright Way"

THE

—a high-quality, **LOW-PRICED**, glass lined batch mixer, pasteurizer (starter can, ripener, etc.) for small Ice Cream Plants, Dairies and Creameries.

This booklet is profusely illustrated with halftone reproductions and line drawings. It contains general data and details of construction on the Pfaudlerette. . . Send for a copy!

- ¶ Easy to set up and operate (complete directions with each unit).
- ¶ Original cost and up-keep low.
- ¶ Improves quality of pasteurized products (no off-flavors or metallic contamination).
- ¶ Most durable on the market (open-hearth steel, lined with glass).
- ¶ Just like larger units now being used by America's leading ice cream plants, dairies, and creameries.

Mail the coupon today for booklet giving details and prices.

Pfaudler

PFAUDLERETTE

In answer to numerous requests from the trade for a small-unit, glass lined batch mixer and pasteurizer to meet the requirements of the smaller ice cream plants, we offer for your approval — the Pfaudlerette Batch Mixer. Hitherto, the price has made the use of glass lined equipment prohibitive to many concerns. THIS NEW TYPE WILL BE WELCOME TO SUCH BECAUSE OF ITS LOW COST. It will have the same design, construction and quality of workmanship, as our larger units, with a working capacity of 125 to 300 gallons.

The use of glass lined equipment for mixing and pasteurizing ice cream mix is now standard practice in this country. If you are handling 125 to 300 gallons of mix per day, the Pfaudlerette should be of interest. It will—

1. Lower your mixing costs.
2. Lower your refrigerating costs.
3. Lower your cleaning costs.
4. Improve the quality of your cream.

Note:—The Pfaudlerette can also be used for a Milk Pasteurizer, or for creamery practice.

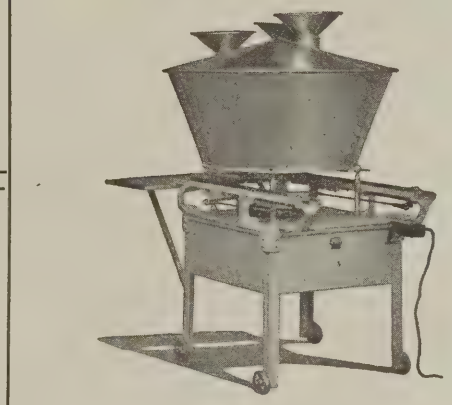
WAGNER, OF CHARLEROI, PA., CONSOLIDATES WITH RIECK-MC JUNKIN.

The Wagner Ice Cream Company, an institution long and favorably known throughout the Monongahela Valley, has consolidated with the Rieck-McJunkin Dairy Company, of Pittsburg. Announcement is also made that the plant of the Charleroi Brewing Company, a part of the Independent Brewing Company, has also been acquired by the Rieck-McJunkin Dairy Company and will be remodeled and equipped for the manufacture of ice cream.

This consolidation and expansion of the Rieck Company will mean that the thriving Valley towns will very shortly enjoy the excellent product and prompt service in the same complete measure that has made the name Rieck famous all over Pennsylvania.

When the brewing company plant remodeling is completed it will rank as one of the foremost ice cream plants in the country. Great progress has been made in recent years in the manufacture of ice cream. The Rieck Company has always been one of the foremost leaders in the country, instantly on the alert to adopt any new and better method or device. All the experience gained in a number of successfully operated plants will be used in the new plant. And, a thing of considerable importance both to the public and the dealers who serve Rieck's ice cream, is the fact that the new plans will enable a much more complete and convenient system of delivery to all the towns in the Valley.

Wagner ice cream has enjoyed popularity in this vicinity for more than thirty years and the company, until the consolidation was owned by L. G. Wagner and James S. Wagner.



In the spring of 1890 George Wagner, father of the present owners, started an ice cream factory in connection with a bakery at 315 McKean Avenue. This was the first plant in the vicinity. Ice Cream was made by hand and packing and delivering was unheard of. The turning of the crank meant a plate of cream and thirty gallons a day was the capacity.

As the town grew business enlarged and with increased sales came the motor driven freezer and a shipping business to the surrounding towns was started. There was no street cars there and very few trains so most shipping was done by boat. When street cars came and surrounding towns came into existence more modern machinery was added, the first being a brine freezer. In 1904 the business had so grown that George Wagner purchased a lot at 415 McKean Avenue and built a new building using part of it for a factory. Each year more business was added and more modern machinery was installed and finally came refrigeration machinery. Incidentally this was the first factory in the valley to install it. In 1919 the sons who had grown up with the business purchased it and commenced on a larger scale, acquiring more territory and adding new equipment, trucks, etc. A year later they purchased the business and new plant of U. S. Orange, at 420 Fallowfield Ave., Charleroi, Pa. This plant was remodeled and more new equipment added. Business grew to such a volume that in 1921, in order to satisfy demands of the public the company sought larger quarters, additional facilities and the outcome, in order to give the public better service, consolidated with Rieck-McJunkin Dairy Company. A public opening and inspection of the new plant will be announced when remodeling is complete.

Trade Quickly Recognizes This Great Value

Rogers AUTOMATIC ICE CREAM BRICK MAKER

$1,500.00 F. O. B. DETROIT

1 Rogers Automatic Ice Cream Brick Maker completely overcomes all drawbacks common to the old way of making ice cream brick. No brick slabs to fuss with—no wrapping with parchment—no three or four trips back and forth from hardening room.

2 Rogers Automatic Ice Cream Brick Maker has been perfected to meet the exacting requirements of perfect ice cream bricks — No ice shell — Exact measure—Perfect division of colors in Neapolitan bricks — Not touched by hands—Perfect bricks free from muss.

GREAT ECONOMY — LOW UPKEEP — ENDURING SERVICE — MINIMUM REPAIRS — EASILY ADJUSTED.

"National Approved Distributors Specialties"

DETROIT CLEVELAND

A Visit to a Chicago Ice Cream Plant

WHENEVER we can find time to visit a good ice cream factory our "nose for news" leads us in the direction of one. It was recently the pleasure of a representative of The Ice Cream Review to visit the Lawrence Ice Cream Company in Chicago and to see something new in preparing the ice cream mix.

The mix is made from fresh skim milk, sweet cream or sweet butter. This plant is located near a railroad, which makes it very handy for them to receive the raw products from the country. Milk and cream is taken in at the receiving door, dumped into a shallow tank and

One of the great fleet of delivery trucks operated by Lawrence Ice Cream Co.

pumped into storage tanks which are placed in the cooling room formerly used for storing cans. The empty cans are washed and returned immediately to the hauler. The result is, no handling or pulling of milk cans through the plant and a great saving in cash outlay for cans.

The mix is prepared in the hot wells, which are shown in the foreground of the picture above. The milk and cream is pumped from the tanks in the cooler and mixed with the other ingredients in these hot wells. The amount of each required is determined by accurate chemical analysis of the milk products upon the Mojonnier Tester. Everything in the mix is prepared at this point except adding the vanilla extract. The reason for this will be mentioned later. The temperature in the hot well never exceeds 145 degrees while the mix is being prepared. The mix is then drawn into the Mojonnier Vacuum Pan, which is the big feature of the Lawrence plant. A Green Gauge indicates when the exact weight of the required amount has been added. This vacuum pan does four things, — it pasteurizes, condenses, standardizes and volatilizes.

This is one of the large plants which has recently installed a Vacuum Condensing Unit for handling the ice cream mix. There is a big saving in the employment of the vacuum unit as will be seen from Mr. Olin's statement. Mr. Louis Olin, president of the company, states

Ice Cream Packaging Machines in operation. Conveyor in foreground conveys cans into hardening room through doors which open and close automatically. Other end of conveyor is seen in hardening room view.

that he makes a better mix at a lower cost, and that throughout the winter he saved about $50.00 per day, and through the summer, $150.00 a day. At the same time he claims it to be a great laber saving device.

The heating of the mix under vacuum thoroughly agitates it and throughout this entire operation, the temperature never exceeds 145 degrees Fahrenheit. For this reason the possibility of cooked flavor is entirely eliminated, and the mix thoroughly pasteurized. Mr. R. G. Thoke, superintendent of the plant, states that going through this operation "it is unnecessary to use any condensed milk in making ice cream mix since while pasteurizing under vacuum just the right amount of water is taken out to produce a standardized mix. The standardization of the mix is a very important feature

WEST SALEM "If Made from Canvas We Make It" OHIO

LITTLE MISS MUFFET

Sat on a tuffet,
Eating ice cream by the quart;
No spider that day
Could scare her away
For ice cream she would hold any fort.

VERILY the thought of the treat in store for her gave courage to even the timid Miss Muffet.

She knew that this particular brand of ice cream [to protect which she was braving even spiders] was worth fighting for. She knew this even before she tasted it—because, on the Poster Boards, she'd seen so many tempting pictures of other people enjoying it.

These beautifully colored big poster advertisements were just as true to life—and as convincing—to Miss Muffet as they are to millions of other people.

[The poster Miss Muffet saw was designed by Nordhem]

for Ice Cream Manufacturers

8 West 40th Street—New York City

of this vacuum pan. It condenses the mix to almost the proper point to which it must be standardized, preferably a little below this point, it can be regulated by adding the necessary amount of water before it is homogenized."

This vacuum pan also volatilizes, that is, gives off and eliminates all off flavors. The vigorous ebullition under vacuum in the pan removes all off flavors so that the ice cream produced has a clean sweet flavor. The vanilla extract is not added when preparing the mix, be-

Hardening Room, Lawrence Ice Cream Co.

cause it would also be taken off in the pan. However, chocolate, strawberry and other flavors can be placed in the mix before it goes to the vacuum pan. Superintendent Thoke says that it intensifies flavors. "It brings out the best flavors, and saves a lot in extracts, because not so much extract is needed."

Prof. R. W. Peterson of the University of Illinois has made a study of this process. He says that this process will eliminate many bad flavors, such as onion flavor and weed flavors which are often found in cream.

After the mix has passed through this process it is drawn through the homogenizer, over a tubular cooler, to the storage tanks in the chillroom where it is aged for about 72 hours. After aging, the mix is drawn down to a fine battery of 80 quart Miller freezers. The finished product is conveyed into the hardening room and is soon ready for delivery.

About a block away from the Lawrence plant is their large garage which is about 100x150 feet, where the great fleet of 40 ice cream trucks is kept. Accompanying the illustration shown, the Lawrence type of truck, which gives them an exceptionally fine opportunity to display their brand" Goldenrod," as it is uninterrupted and occupies the whole side of the truck. These trucks were designed for Mr. Olin after specifications and built according to them and have been admired by manufacturers from all parts of the country, not only for the convenience of handling packaged and bulk goods, but also on account of the splendid advantage for advertising. Each of thes trucks will handle about 800 gallons of ice cream and the brick of ice cream is as easily mastered as a letter in a vertical file in an office, as the bricks are placed in receptacles or drawers, which may be pulled in and out.

This picture shows two of the Mojonnier ice cream packing machines which are in the Lawrence plant. The packages are filled and tied and then placed on the conveyor and taken into the hardening room.

We also show a view in thelarge hardening room where he keeps constantly in storage, thousands of gallons of both bulk and packaged ice cream, as Mr. Olin prides himself on working six days in the week, just the same as other business enterprises. You will note on the right hand side of the ilustration, the large number of cartons of ice cream, which were packed automatically by machine, without whatsoever by human hands. The conveyor from the freezer room to the hardening room, which fills up about two-thirds of the length of the hardening room, is a wonderful time saving device at the Lawrence plant, as the cans of ice cream and the trays containing the packaged brick ice cream are automatically conveyed from the freezer room into the hardening room thrugh doors which open and close automatically.

JAMES H. LAHER BUILDING NEW ICE CREAM FACTORY.

Bedford, Pennsylvania, is to have a new ice cream plant. James H. Laher is erecting a new building near the site of his present plant and will dismantle the old one as soon as the new structure is erected. The cost, together with refrigerating equipment will be about $25,000. The McCormick Company, Inc., of Pittsburgh, are the architects and engineers in charge of the work.

PAVED ROADS AND DAIRYING.

Paved roads and dairying go hand in hand. As more improved roads are constructed, milk routes are extended and the farmer farther from the city is provided with a market for his milk. Over unimproved routes requiring wagon delivery, the longest route possible is only

Off the Mainland

ICE cream is being daily regarded more and more as healthful food product instead of a Sunday dessert or to be served when "company" comes. Its health-producing powers are fast becoming known not only to the larger countries but to a great many of the smaller corners of the world, and it is now being more generally used as a food for daily consumption.

Not long ago, a shipment of one thousand gallons of brick ice cream were sent from Honolulu, Hawaii, to the island of Guam. These islands are about two thousand miles apart. The shipment was made by the Honolulu Dairymen's Association, Ltd., who manufacture and distribute milk, cream, buttermilk and ice cream.

The island of Guam, Uncle Sam's far-flung outpost in the Pacific, is at the present time little developed but the possibilities are great. The Guamese are an amiable people, being intelligent and eager to learn, and since American occupation at the close of the Spanish-American war, schools have been established. These natives are of mixed blood with complexions from whites to dark browns. In olden days, Scotch, French, English and Spanish ships stopped in the harbor of San Luis d' Apra and when the ships departed, some of the men remained behind and eventually married the native Chamorro women. Therefore, one cannot judge from the family name whether he is among Spaniards, French or English people. The men wear trousers and shirts, but unlike the American custom, (with the exception of perhaps the days before prohibition on the morning after an American "stag) they wear their shirts on the outside entirely. The women (unlike the American women) like ample skirts and waists with sleeves—but they save their shoes for special events. We might say the opposite in this about American women's customs—with the days of aesthetic dancing as the predominating rage—may we suggest that our native women discard their shoes for special events? One is amazed at the great devotion apparent between parents and children of the Guamese. When their children are about to be married, the parents plan and sacrifice for them, that they may have a proper start. Then in return, the children take care of the parents when they are too old to work. The spectacle of old women forgotten and uncared for by their children, as they are in Samoa and Indian tribes, is unknown in Guam.

Beach "CONERS" Picnicing on the Island of Guam.

Many of the better houses are constructed of wood, stone or stucco, with roofs of colored tile. Some of the older residents are stoical enough to stick to the customs of their forefathers, and prefer dwellings thatched all over with palm tree leaves. In Agana, the seat of the government, the pace is set. The houses are more modern and the streets more spacious. In the public square here, you will see the principal church of Agana and of Guam. It was founded in 1669 and shattered by an earthquake in 1902. It has never been restored, but the natives give it the same degree of adoration. A great bell tolls every morning at 4 o'clock calling the people to matins and to their daily tasks.

Unlike America, the natives grow just enough foodstuffs for their needs, they have no market for the surplus, the island being so isolated. Their wants are extremely simple, and the need of a surplus would come only with a catastrophe. This they refuse to anticipate.

The roads are very poor, many not being more than mere trails. The water buffalo are used to draw the carts. The need of better transportation retards the development of the island, as fine lumber is obtainable and could be a valuable export.

Cotton trees grow wild in three varieties and they flourish at a height of 60 feet. The long leaves of the pandanu are braided into mats and hats by the women of Guam; and from the hau tree, the men manufacture a strong rope which water cannot penetrate. The pine-apples are juicy and the breadfruit is delicious. Copra, the dried meat of the cocoanut, is the only item exported. Rice is grown; sweet potatoes; corn; tobacco; coffee bushes, stooping from the weight of berries; and last, but not least, the palm trees contain large quantities of that pitiful rival of the dairy cow—the cocoanut, which are the best in all the tropics, in Guam.

The temperature is hot; on mean days it is 80 degrees. This ought to be good for many repeat orders on ice cream for the Honolulu Dairymen's Association,

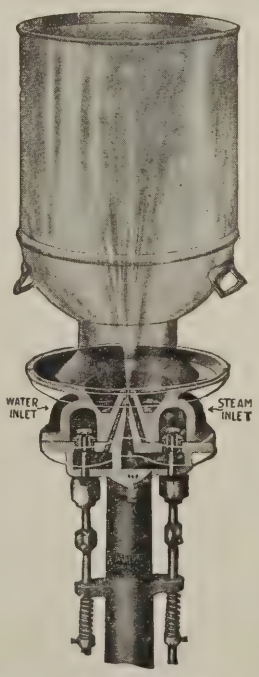
TWIN CITY OFFICE: 2490 UNIVERSITY AVE., ST. PAUL

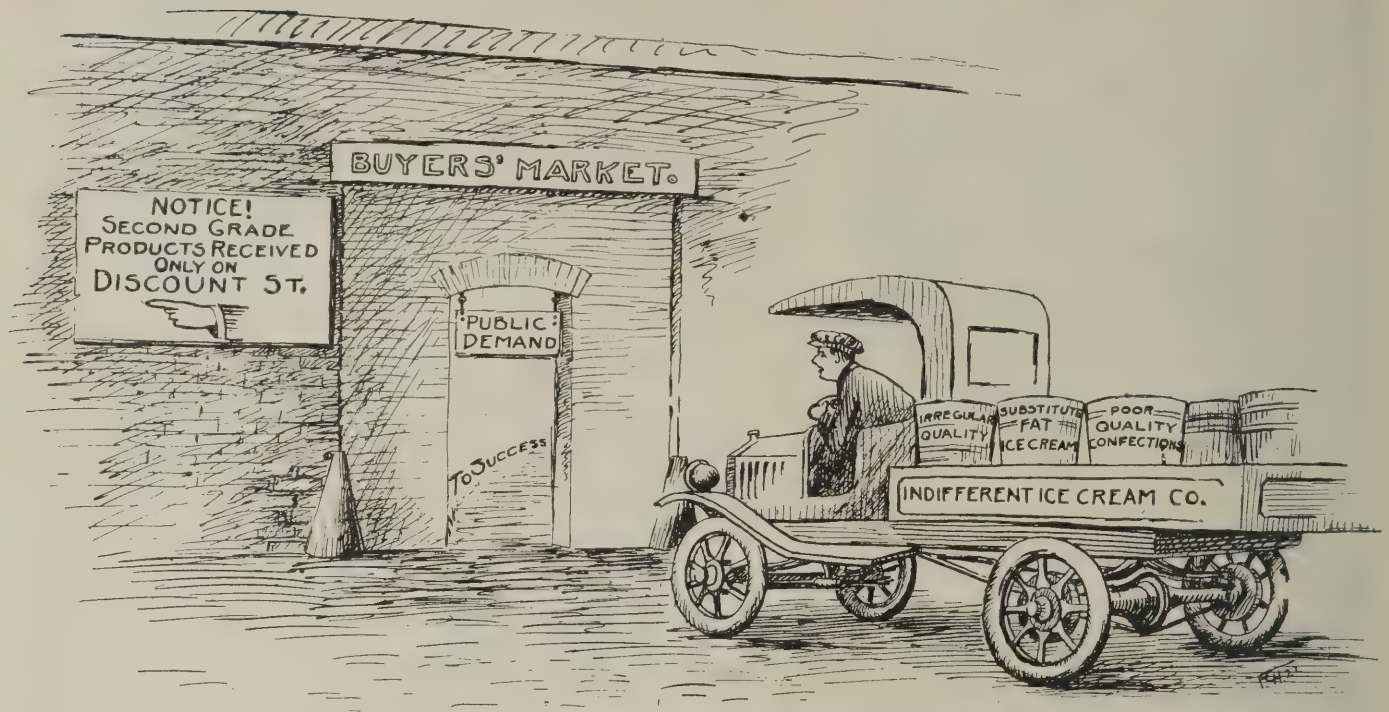
Danforth Jet Rinser and Sterilizer



A can steamer, to be satisfactory, must be fast—thorough—and convenient in operation.

The Danforth steam jet is located directly beneath the orifice. The action of the jet breaks the water into a fine spray and greatly accelerates its speed. The water is heated by the steam as it passes through the ejector.

Note the convenient operation of the valves directing the water and steam. A flexible foot tread, simply by moving the ball of the foot one inch to the right, shifts from water spray to live steam. The rinsing is instantly followed by sterilizing. Nothing could be speedier or more convenient. The hands of the operator are left free to hold the can.



It is low enough in price to make it practical for the smallest plant—large enough in capacity to meet the needs of the plant handling 300 cans per day. A thoroughly practical and dependable piece of equipment at a moderate cost.

Price, painted gray, $45; galvanized, $50

Indiana Manufacturers of Dairy Products

OFFICE OF THE GENERAL SECRETARY
306 CHAMBER OF COMMERCE
Telephone, Main 3265
INDIANAPOLIS, IND.

Once upon a time this driver used to drive up to this same gate and, strange to say, found no difficulty in passing through for the gate was wider then and there was another name over it. If the driver's eyes have been shut for several years they seem to be wide open now. It may be that another driver may run bang into this gate before he opens his eyes, and this gate has the appearance of being stronger than any ice cream truck.

Yours truly,

A. P. HOLLY,
Secretary.

WE ARE ON THE OTHER SIDE OF THE FENCE

There are two sides to a fence, just the same as there are two sides to an argument. Put a calf on one side of the fence and he immediately gets the idea that you mean to punish him for one reason or other and he wants to get on the other side. Not so with the ice cream manufacturers today. He has been on both sides of the fence, but it isn't his fault. The American public have acquired a taste for good ice cream and the ice cream market, which is the fence that we have been talking about, has moved.

It is not so very long ago since the ice cream manufacturer could fix up a little ice cream, sugar, flavor and extract, put it in a freezer, churn it around for a while and sell it as ice cream and make some money out of it. Those were the days when we had what Mr. Holly of the Indiana Manufacturers of Dairy Products would term a "Sellers' Market." Today we are on the other side of the fence, we ice cream manufacturers. We are on the side where we have to face a "Buyers' Market," where the buyer has an opportuntiy to get the quali y of ice cream he wants and if we do not make it, he is either going to do without or he is going to go to the other fellow who will make it.

Secretary Holly has illustrated this point very graphically in a circular I enclose (shown on this page). This was sent out to ice cream manufacturers belonging to the Indiana Manufacturers of Dairy Products.

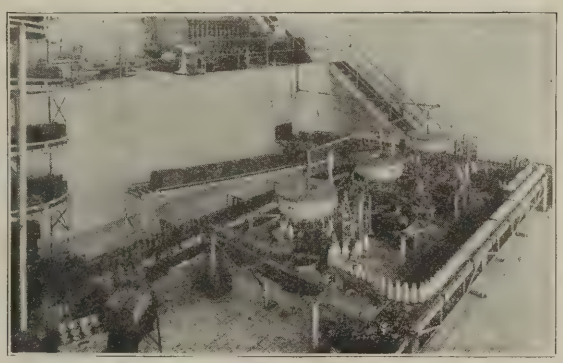
The manufacturer of today must either get on the inside of the fence or get on the outside and stay out.

Yours truly,

J. D.

INDIANA MANUFACTURERS OF DAIRY PRODUCTS.

Secretary Holly Offers Assistance in Campaign for Cleaner Cans. Good Words From Good Men of Our Good Association.



If ice cream manufacturers will send us a list of your dealers—or a list of those dealers who are careless about cleaning cans, we will send to them a letter on stationery of the Food & Drug Department and signed by them calling the dealer's attention to the fact that it is illegal to send back ice cream cans that are not thoroughly clean.

It would be advisable that **ALL** ice cream manufacturers would do this.

John Risch: "It is only when I stop to think of the condition of the industry at that time and to compare it with the advancement that has been made up to date, that I realize the wonderful work that the Association has done.

You Should Know What It Will Cost

Bottling Room, Akron Pure Milk Co., Akron, Ohio.

Pasteurizing Dept., York Sanitary Milk Co., York, Pa.

Leichtman Ice Cream Co., Hazleton, Pa.

No factor connected with the erection of a new plant or a remodeling job has caused owners as much grief and worry as final costs. Many have made investment appropriations and arranged the financing details only to find, after they were well under way, that the cost was underestimated. Unexpected developments continually cropped up as the work progressed which necessitated additional outlays or expensive operating delays. And all because they did not have a definite knowledge beforehand.

McCORMICK

Architectural and Engineering

SERVICE

first of all, counts your costs and tells you in advance of the letting of a single contract. Furthermore, it gives you a definite knowledge of operative capacities, as well as visualizing the appearance of the completed plant, equipment placements, etc. *Every element of guesswork or speculation is eliminated* and you proceed with a *full knowledge* of just what your plant will produce and *what the total cost will be.*

Can you afford to take any chances on the success of your plant when such definite information is available?

An inquiry will not obligate you in any way.

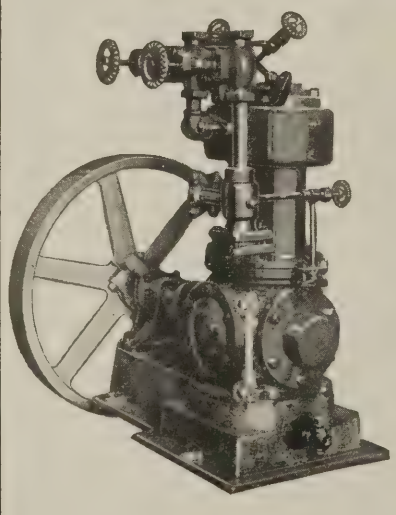
41 Park Row

Construction Executed by Your Own Local Contractors Under the Direction of Our Own Superintendents

"It has been a pleasure to me, gentlemen, to recall the early days of the Association, and I am glad that I had an opportunity to play a part in its development."

"In conclusion, I would like to have you stop and think for a few moments and picture the industry as it would exist without the Association. It seems to me that it is a good deal like the home life of a man who has been very happily situated, but never realized just how fortunate he has been until he loses his helpmate and then, when the home is broken up, he can look back and think of the many things that were done for his good and comfort, that he was almost unconscious of at the time they happened, and I think our Association is a good deal the same way. We don't really, any of us, appreciate its value, and only realize its real loss to us if it was taken away from us."



* * *

E. A. Marple: "We learned during the war the advantages of sitting down at the table once a month and meeting our competitors on a social as well as a business basis. I believe that the Creator made us so that the better acquainted we become, the easier it is for us to see the good qualities and to lose sight to some extent of the poorer qualities in our natures. So that the better acquainted we have become through Association work, the less suspicion we have of our competitors and are willing to take a broader view of his point. I want to bring this out if I can so that you will understand that there is a psychological effect in an Association of this kind that is valuable to you and me."

* * *

A Great Event: Is scheduled for July—the biggest and best in our history. "Watch the show window."

A. P. HOLLY, General Secretary.

DID You ever stop to think of the saving on reliable refrigeration with small and medium ice cream plants. They pay for themselves in less than a year.

MANUFACTURERS AND ENGINEERS

1221 Belmont Ave. CHICAGO, U. S. A.

OFF THE MAINLAND.

(Concluded from page 26)

and we have a vivid picture of these natives after having once tasted the delicacy of ice cream, crowding around the San Luis d' Apra harbor when one of the ships containing this precious cargo, sails in.

The island of Guam is shaped like the boot. The population is bunched on this boot, in several towns, San Luis d' Apra, Agana, Pago, Tarofofo and others, to the extent of about 15,000 inhabitants in all. Hurricanes are frequent and disaster often overtakes the little island, until a ship comes in to feed the hungry, after the storm has destroyed the fields and gardens and has wiped out everything.

Guam is only a diamond in the rough, with a length of 30 miles and a width of six or seven miles—a total area of approximately 200 square miles—yet they know of and like ICE CREAM. Thus, have we proven to you, friends, that even in the little corners of this interesting old world, this great product, ice cream, is being consumed and valued as a food.

The Canadian-Australian liners also stock up on ice cream at Honolulu, manufactured by the Honolulu Dairymen's Association, and this popular, frozen dainty travels many thousands of miles, being served at meal time to the passengers, who relish their favorite dish which can be served even though they are thousands of miles from home.

⚜

COMING ! ! !

Members and friends of the Southern Association of Ice Cream Manufacturers, there will be two big events taking place in December that you'll be interested in. One of them is Christmas — the other is — oh boy, ain't this grand—the Tenth Annual Convention of the Southern Association of Ice Cream Manufacturers. And Santa Claus isn't making any bigger and better plans for the success of Christmas than J. W. Clopton, the Secretary, and others in charge are making for the success of this convention. You know Clopton—when he gets behind a thing and pushes, something's bound to happen. Mark the dates on your calendar now—time, December 5th, 6th, and 7th; place, New Orleans. Watch The Ice Cream Review for further news.

MANAGER OF IMPERIAL CO. RECOVERING.

W. M. B. Sine, who was injured in an automobile accident in May, is reported to be improving rapidly, and according to his secretary, is expected to be as good as new in a few weeks.

His injuries were the result of the automobile in which he was riding going over an embankment, and turning over three times. Mr. Sine was seated with the driver, and the first time the automobile turned over the back of the front seat hit him in the back. The second time it struck his face, broke several facial bones, and threw him out of the car.

The top of the car kept the other occupants of the car from being thrown out, and they only suffered bruises and shock. It was a most remarkable escape from death for all of them.

Pacific Association of Ice Cream Manufacturers

Proceedings of Annual Convention, Seattle, Wash.

CONCLUDING ADDRESS of W. R. W. NICHOLS, ON "THE SILENT SALESMAN OF ICE CREAM."

Continued from May issue.

You have, as ice cream manufacturers, spent time and money in the careful study of butterfats, total solids, pasteurization, homogenizing, also carbonization and all the other scientific methods used in the manufacturing of ice cream, but how many of you have gone into the proper blending of flavors for use in ice cream? The quantity necessary to use, the class of cream manufactured, you almost invariably leave this to a test of different vanillas submitted to you. We as manufacturers of flavors work in the dark. We are telling a manufacturer of ice cream in Newark, New Jersey, to use the same amount to a ten-gallon batch as we are the manufacturer here in Seattle. Some ice cream manufacturers have a particular formula which has taken them time and expense to work out. They do not care to hand this formula promiscuously to flavor supply men. But even at that, is it not possible for you ice cream manufacturers to give us say three or four different formulas among which is your own? Let us work this out scientifically in our laboratories and tell you the amount of flavor needed for each formula, thereby securing the exact flavor for your particular formula without the need of disclosing same.

There is another point that we come in contact with as flavor supply men, and that is the ice cream manufacturer who tells us he makes his own flavors, and it always reminds me of one time when I went visiting, and they had me turning an ice cream freezer. The folks told me that they were making better ice cream in that ice cream freezer than any ice cream manufacturer could produce. It was good they believed so because they could not prove it to me, and do you folks believe that the home folks can make a better ice cream than the ice cream manufacturers of the U. S. can whose investment in the manufacturing of ice cream today runs somewhere about one hundred million dollars? Manufacturers who spend time and money in scientific experiments as to the proper blending of ingredients for the manufacturing of ice cream. You will all say it can't be done. Well, then, stop and realize that the same amount of money that you have invested in the manufacturing of ice cream is also invested in the scientific manufacturing of flavor, and I believe you agree with me that the folks with the ice cream freezer in the home is just as efficient as the manufacturer who tries to make his own flavor.

You have 25 flavors as silent salesmen in ice cream, and they are as follows: The most predominent one vanilla; then, lemon, orange, apricot, banana, brandy, grape, pistachio, rum, creme de mint, roman punch, tutti frutti, walnut, maple, almond, coffee, cherry, pineapple, raspberry, strawberry, and last but not least a wine flavor called sher-i-vin. This is sherry wine jellied.

When you hire a silent salesman in ice cream, hire a good one. Look into the qualifications. Is he pure—has he strength of flavor; has he the ability of bringing you repeat business? In other words, is he a true representative of the ice cream industry?

I thank you. (Applause.)

Mr. Swanberg: Will you answer some questions?

Mr. Nichols: Yes, certainly.

A Member: I would like to ask the gentleman if a chemist could analyze vanilla and tell if it is a pure product?

Mr. Nichols: Yes, an analysis will show.

Mr. Dreyer: I took a sample of vanilla compound to Curtis & Tompkins in San Francisco and I purchased this vanilla to contain 27 per cent of pure vanilla mix and I took it down there and I got one report and it was not satisfactory, and I thought there might be a possibility of them making a mistake, so I took it to Smith, Emery Company, and I got the same report. The chemists told me that they could go no further with the analysis unless they would give it a color test which would be an additional $50, but he was afraid it would not prove very much even then and the analysis he gave me would be about sufficient. You might bring out a little more about the color test.

Now, I told the manufacturer about it and he told me if I wanted to run a color test, all I had to do was to put in a little burnt sugar and give it a color test.

Mr. Nichols: It is very easy to give vanilla the color test. You take a piece of cotton and put some of the compound on it and put it in a pan and as it heats up it will turn brown if there is burnt sugar in it. If there is not any, the color would not turn brown; the cotton would not turn brown. It is a very simple thing to do. There is a certain amount of color in vanilla beans; a certain percentage of it is water, and there is some resin.

I do not believe a chemist could tell the exact percentage of beans used from the resin found. The only way he could do it would be from the color test and that would be to run it to find out how much natural color

"MAD AS A HORNET?"

There is no one to blame but yourself if you neglect to stop the "snitchin'." You can do it in short order. Simply use Derycote and adopt a **standard** color. Derycoted tubs and cans don't rot or rust, either. Derycoting saves money both ways.

Derycote
PAINT YOUR PERSONALITY ON YOUR PACKAGES

is a brilliant elastic colored enamel made especially for Dairy and Ice Cream service.

Handling or transportation will not cause it to chip or crack. Hot or cold water, salt, ice, brine, washing powders, etc., will not dim its lustre or impair its protective qualities. Made in 24 colors, as well as black and white or in your standard shade if our regular colors don't suit.

Write for our color card and ask for a sample.

THE ASSOCIATION OF ICE CREAM SUPPLY MEN MEMBER

The National Paint and Varnish Company
CLEVELAND, OHIO, U. S. A.

The C-T Bantam

NOW is the time to get at the truth about delivery costs. What are the factors that are causing extravagant expense in the delivery systems of so many businesses? Why are ice cream manufacturers so often ashamed to admit the cost per package or per mile of delivery?

The answer is first of all to be found in the selection of the wrong vehicle for the work to be done. Second, in the lack of complete cost records on the operation of delivery equipment.

That the right type of truck may be used for the work best suited to it, the field of transportation must be divided—electric trucks for city deliveries with many stops, gasoline trucks for interurban and long haul transportation.

Ice cream manufacturers who have applied this principle to their deliveries have benefited with larger earnings and less delivery troubles.

The Detroit Creamery's efficient fleet of C-T Electric Ice Cream Trucks. Low cost of upkeep, longer life, no disagreeable odors to permeate the cargo.

Let the truck user keep accurate, complete delivery cost records. They will awaken him to a realization of the needless high cost of delivery. They will enable him to buy his equipment with judicious care and to effect great savings.

In the electric truck field, no equipment will give better service at less expense over a longer period of years than C-T Electric Trucks. The transportation records of C-T users testify to the great savings effected because of C-T simplicity of design, sturdy construction and high standards of manufacture.

Commercial Truck Company *Philadelphia*

C-T ELECTRIC STREET TRUCKS

there was. A chemist can separate any added chemical color from the natural color found in the pure vanilla.

Mr. Dreyer: The result of this particular test was that the resin was nil, and I told the manufacturer of it and asked him what he had to say to that, and he said "By God, I have vanilla in it, and I have got 27 per cent vanilla and I will show it to you." And he showed me a sample of a compound he manufactured that had 27 per cent of pure vanilla in it, but the compound that I had was not worth anything and I paid $8.25 for it.

A Member: Maybe it was like the rabbit sausage. (Laughter.)

Mr. Nichols: I was thinking of that.

The first thing a chemist looks for in vanilla is the total solids, and the total solids is the thing that makes pure vanilla, resin, glycerine or sugar make up the total solids.

The National law under which we make pure vanilla says that we can use either glycerine or sugar and the solids are composed of resins, glycerine or sugar, and the next thing is to find or make the lead acetate test; and after the lead acetate test has been made, the next thing is to ascertain the alcohol content by volume. That does not tell anything, because a man is not wasting alcohol unless he is trying to sell booze. If he is using alcohol in accordance with the resin, he wishes to keep in solution, he is using an excessive amount of alcohol; he is just using enough to keep it in solution.

The next thing is the specific gravity; and the next thing is the ash. Any thing that will burn has a certain amount of ash in it. The next thing is the actual test and that is the commercial test.

We went out and got samples from different places where the product was on sale and then subjected it to the baking test. Nobody knew what the product was and fifteen housewives were invited in to try it and thirteen of them decided on one piece of goods. The consumer is the only buyer we have got and it is principally a matter of what the consumer is to think about it.

If you want to make a real test, get a bunch of consumers together and let them try it, and if it suits them, you have a good seller.

Mr. Swanberg: Have you a revolver?

Mr. Nichols: I do not carry such a thing, Mr. Swanberg.

Mr. Swanberg: Then I will say that if I was a chemist I think I would buy my own beans and make my own vanilla.

Mr. Nichols: I will say to you that in a way I would not blame you. It is rather funny that I should agree with you; but if you had the facilities to produce your vanilla properly, I should have to agree with you.

One thing in all of our business today is to get the cards on the table; in other words, if a gentleman says he wants to buy a certain priced piece of goods, I try to get what he wants. We have been in the flavor business only two years, although I have been in it many years, and I wish to say that if you will tell us what your formula is, we will send it to the laboratory and tell you what it will do.

Each of us should be frank with the other because you are sellers of our flavors and it is the same with the machinery, if you buy a particular piece of machinery and they tell you honestly what it will do and it does it, you are satisfied. We want people to feel when they get a product that it is exactly what they paid for.

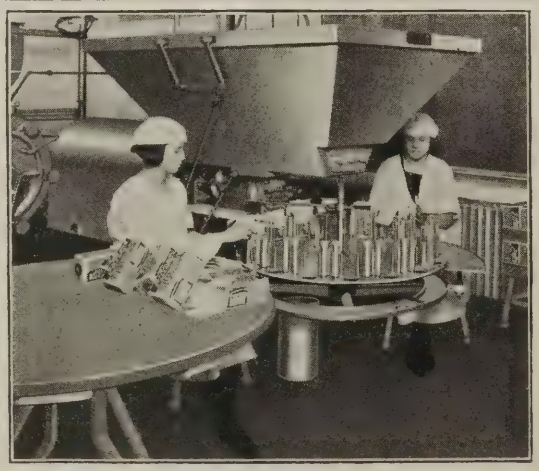
We have spent worlds of money in experiments, and we think we are prepared to give you exactly what you want.

Mr. C. H. Michel: The gentleman who asked the question first, stated that he had bought a compound vanilla and took it to the chemist for analysis. The very name of that should have put him on his guard so he would have questioned the manufacturer of the product rather than to take it to the chemist.

Not ten per cent of the housewives in the country know the difference between a real vanilla and compound whereas one is a product of true vanilla.

The Food Laws of the country provide a way in which those two products can be designated, but we fail to understand what the law requires the manufacturer of these substitute articles to do. But that man cannot brand his article as vanilla; he must use the word "compound," and every up-to-date manufacturer is aware of these things, that the man using the compound extract today cannot be assured of how much quality is put into the compound.

Mr. Emery: I am not a manufacturer of vanilla, but I have used it a great many years. When I was a boy vanilla beans cost from twelve to fifteen dollars a pound, and today they are worth about four dollars and fifty cents a pound.



My family comes from Massachusetts, and we all know the fight made by Burnett. A friend of mine once came to my house for dinner, and he was given some food flavored with vanilla, and he complimented it very highly, when as a matter of fact he was eating a substitute, and he thought he knew all about vanilla.

People sometimes compliment Mrs. Emery on her cooking, and she uses the substitute.

* * *

Mr. Dunne: Are there any other questions? If not, let us stand and sing the "Maple Leaf Song." (Members rise and sing.)

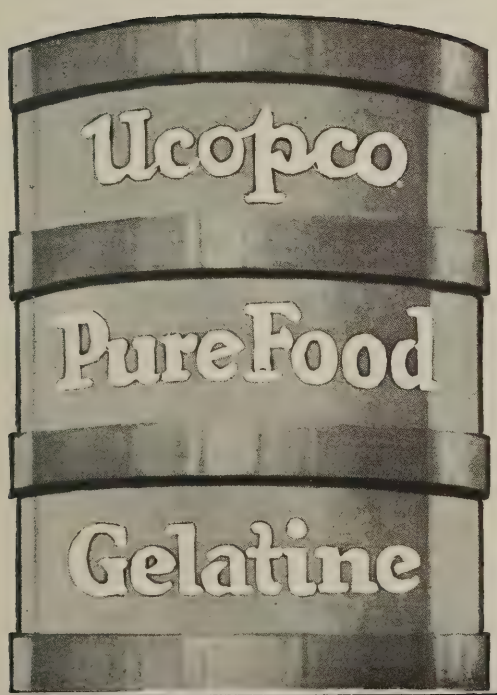
Where "UCOPCO" is made

There Are Reasons Why This Plant Has Been Operating to Capacity for the Past Four Months



WHEN any plant finds it necessary to run to utmost capacity during a period of depression, it proves conclusively that its product must rank far above the average.

During the past four months our mammoth plant has been running night and day and immediately shipping its entire production.

Salesmanship must be given credit for its part in creating this unusual success. But salesmanship alone could not produce this phenomenal condition.

The product must be right.

Let us show you why UCOPCO Gelatine is so tremendously popular.

The United Chemical & Organic Products Co.

SEVERAL GOOD DEVICES FOR MAKING COATED ICE CREAM BARS ARE NOW ON THE MARKET.

I take pleasure in introducing to you Mr. C. B. Terwilliger, a public accountant of Portland, Oregon, who has had a world of experience in Eastern factories and some in the West, and he is going to outline some results of his experience in that work.

* * *

ADDRESS BY. MR. C. B. TERWILLIGER.

Mr. Terwilliger: Mr. President, members of the Pacific Ice Cream Manufacturers' Association. ladies and gentlemen: I consider it a great honor to have the privilege of addressing you on accounting in connection with the Ice Cream Creamery and Associated Industries.

Being a stranger to many of you, perhaps a word as to my qualifications to address you on this subject would not be amiss.

I secured my initial experience 21 years ago in Southwestern Iowa with the Clarinda Poultry, Butter & Egg Company. There were 5 plants, 66 branches and 15 road men. Other concerns with whom I had connections, all of whom were under the general management of Sherman White, who now is head of the Produce Department of Morris & Company, Chicago, were the S. P. Pond Co., Keokuk, Iowa. There were 5 plants in this company: the Iowa Cold Storage Company, Clinton, Iowa; the largest cold storage plant in Iowa; the Wadley Company at Dubuque,, with plants at Waterloo and Iowa Falls; the Dairy City Creamery at Manchester; the Freeborn County Creamery at Albert Lea, Minnesota; the Gray-White Company at Tiffin, Ohio; the Sherman White Company at Fort Wayne, Indiana.

In 1910, Swift & Co. absorbed this aggregation of plants. The system I had in use was taken over by Swift & Co., and is the one they now have in use in their one hundred plants.

After staying with Swift some four or five years I went with the Iowa Packing Co. at Des Moines. W. F. Fuller, the former president of the National Packing Co., was the president. This was a ten million dollar concern. My duties were as auditor. Later I connected with the Sugar Creek Creamery Co. at Danville, Illinois. H. C. Horneman, their president, no doubt, is known to many of you. This concern was the largest manufacturer of butter in the state of Illinois. The Danville plant alone made over a million pounds a month during the summer season. We had six plants. I held the position of auditor.

From there I went with the Beatrice Cold Storage Co., Beatrice, Nebraska. I was secretary and auditor.

I later connected with John Morrel & Co. at Ottumwa, Iowa, as manager of the produce department.

Coming West about a year and a half ago I was with the Henningsen Produce Co. as auditor at their Portland office.

I trust that this brief outline will satisfy you as to my qualifications from a practical standpoint; in addition to this I have backed up my practical experience with intensive study, holding two college degrees.

Accounting, as I have outlined it in connection with dairy and produce lines, is divided into eight main divisions consisting of the purchase, buying expense, manufacturing expense, selling expense, power and refrigeration, delivery expense, indirect administration and selling—sales.

I will now take up these divisions in detail.

Now, to commence with the ice cream department.

Under the purchases in the ice cream department, we have milk and cream, condensed milk, butter, which, of course, is homogenized, ice cream powder and sometimes milk powder comes in, gelatine, sugar, strawberries, miscellaneous fruits and flavors. That makes up the purchase department in the ice cream industry. From this we deduct any cream sales that may have been made before the cream is frozen. Then we have the inventories for the first of the month and for the close of the last month of the period and the yield is computed. The yield is the vital factor in the ice cream industry.

We then have a manufacturing expense made up of factory supplies, factory labor, power, and refrigeration. The power and refrigeration is charged to the ice cream department, if you have more than one department in the business. Then come hauling, factory maintenance, factory miscellaneous, rent, depreciation and building maintenance. This makes up the manufacturing cost, and we then carry it forward to the cost of ice cream sales, at which point we take up the opening inventory of the manufacturing department at the first of the period and deduct the inventory at the close of the period.

We have the sales expense under which we have the freight expense, drayage and ice and salt for packers, office labor, office expense, delivery expense—and while we are talking about delivery expense, that portion is charged from the general delivery expense—salesmen's salaries, salesmen's expense, shipping labor, commissions, shipping expense, advertising, exchange, bad debts, discounts, packer maintenance and can maintenance.

This makes up the total of selling expense.

And we have the sales divided into city, country and wholesale, and possibly claims. By deducting the total of ice cream sold the cost gives the departmental loss and we then come to the indirect selling and administrative expense, under which we have officers' salaries,

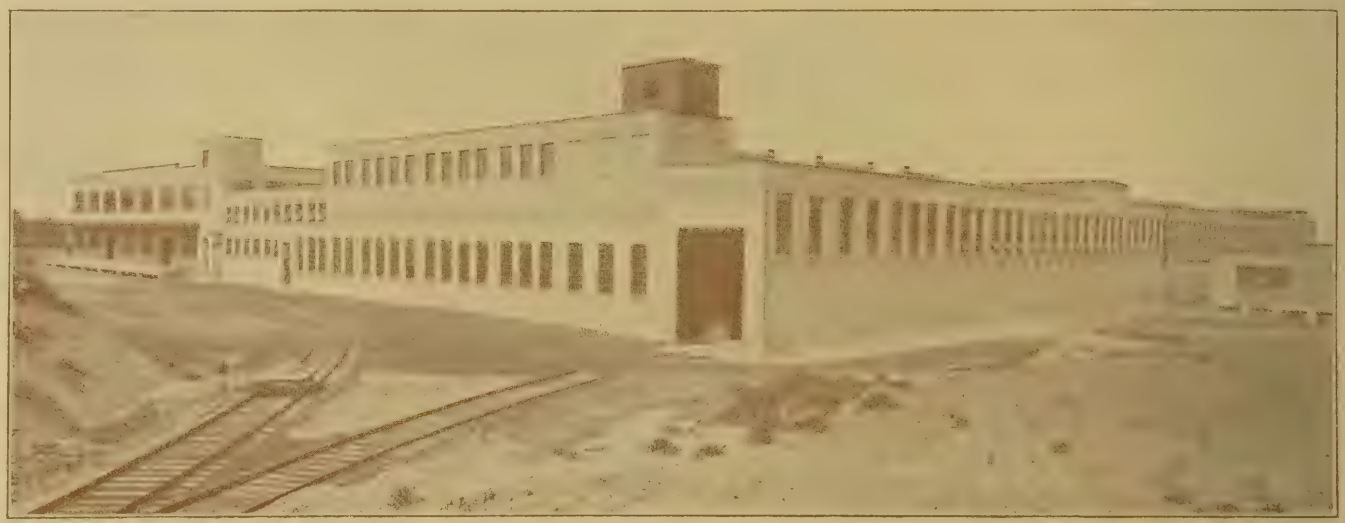
Good Flavor

B-F VANILLA and minor flavors are good flavors — specifically intended for ice cream manufacturers who appreciate the value of good flavors, who know that a quality flavor is always the safest, best and most economical buy.

B-F representatives, when calling on you, solicit your flavor business on a basis of a quality product, a fair, reasonable price, an assurance that your order will be promptly and correctly filled, and of the satisfaction they know B-F flavors are giving their regular customers.



It's this user satisfaction that holds our present trade and explains why B-F representatives are glad to be identified with us.

officers' expense, manager's salary, manager's expense, interest, mortgage interest, rent, taxes, insurance, office supplies and office expense, general freight items, advertising and special advertising, stationery and printing, miscellaneous items, legal expense, auditing, telegraph and telephone, depreciation, discounts, convention expense and donations.

This makes up the total on indirect expense which must be applied as a whole to the costs.

We have the suspense items which are hang-overs from the previous month. Sometimes we have to transfer this suspense account, showing it up as a separate item, not to conflict with the current month's results.

These items then are added to or deducted from the indirect selling, taken from the departmental loss to make your net result.

We will now take up the creamery department. The same routine applies, only more comprehensively.

No doubt a great many of you gentlemen operate butter and other manufacturing plants in connection with your ice cream.

In the creamery division we have some four or five types of creameries. We have the community creamery, or co-operating creamery, operating on the direct shippers' plan, operating on the station basis, while again we have a creamery which is a combination of all of these. We have the contract cream, cream shipped from other creameries, starter and department transfers, in the case you are operating in the milk business there will be the transferring of sour milk from the milk department to be churned into butter, and we have our station loss, which in a company operating a number of stations is a vital proposition.

In one creamery with which I was connected we had one hundred and seventy-five creamery stations at that one point and they were an important matter in the summer time.

We have the buying cost, which is made up of field superintendents, labor and expense, station salaries and commissions and station expense. A great many items make up station expense, advertising, drayage, transportation, cream can maintenance, station maintenance, office labor and supplies, exchange, cream checks, and depreciation.

There is a distinction between maintenance and depreciation. Maintenance is generally the necessary upkeep, keeping machinery in order, and unless you add that to your sales cost, you are going to be out of luck when it comes to replacing your equipment.

We then take up the inventory sheet on hand at the first of the month and the close of the month, which includes unchurned butter or cream, or our churned overrun.

We have manufacturing expense consisting of plant supplies, labor, power and refrigeration and starter, plant maintenance, rent and building maintenance, and miscellaneous.

Up to this point, the cost is the same, and then we make a division between tubs and cubes. You have to allow for the shrinkage, putting it into the tub or the cube.

The supplies are somewhat different and the cost of labor, and we have the printing department, where the supplies are assembled. Those are the two main divisions in the creamery department, the tub and the cube butter, and the print butter, and this carries us to the inventory section, where the butter is already prepared for market.

We then take up the butter transferred out of stor-

age, and then we take up the inventory on the first of the month, and deduct the inventory at the close of the month which gives the butter to be sold. To this is added the selling expense which is practically the same as outlined before. This gives the total cost of the butter sold for the month, and then we have the sales in city, country, consignments, wholesale, department transfers in transferring sweet butter to the ice cream department. We deduct the returns and allowances.

All of these forms, by the way, carry comparisons of the current year against the previous year, giving the averages.

Mr. Dunne: Are they given in comparison or in dollars and cents?

Mr. Terwilliger: Both; they have the weight and average, the amounts of the two years side by side in every department.

Going to the delivery expense I spoke of a few minutes ago, some concerns like to figure their delivery expense as compared with what it would be if they had to hire it all outright.

Under that section we have any outside hauling that may have been required and any outside labor, horseshoeing, if they have any horses, gasoline, rent, building maintenance, and feed.

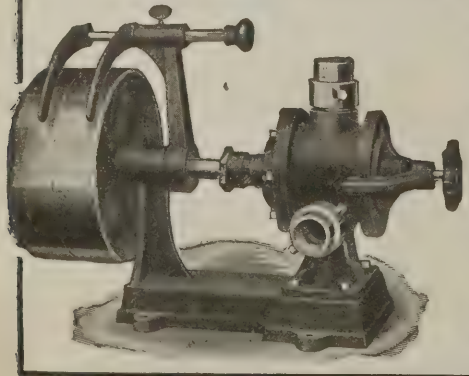
Under power and refrigeration we have supplies, labor, electricity purchase, fuel, building maintenance and water. The sales cost would be department revenue. Under the sales revenue department, the servics which would be rendered would include refrigeration for the ice cream department or cold storage if you are operating cold storage.

Some concerns furnish power as a commercial proposition and also cold storage, light and heat. Getting down to the—by the way, the same thing holds good of course in the artificial ice business, and that is a production proposition, manufacturing, and if you are in the business of the retailing or wholesaling of ice business, that would be true, and your sales would be city, country, wholesale and department transfers. The purchases of water, and so forth, enter into your selling cost.

One concern I was with in Nebraska had a retail ice business and it was quite an item of expense.

The cheese department is lined up somewhat along the line discussed for the creamery, the only difference being water, which is a large factor in the ice business. We have the creamery butter, the process butter, the egg department, the homogenizer, hides and milk and cream business and poultry business and cheese business. I doubt whether any of you gentlemen are in the poultry business very extensively; one of the concerns I was with in the Mississippi Valley made a specialty of feeding poultry. We would have from fifty to one hundred thousand head of poultry on feed, and it was essential to keep the weight of the poultry on feed and the cost of supplies and all of those things. The weight of the product packed and also the killing shrinkage.

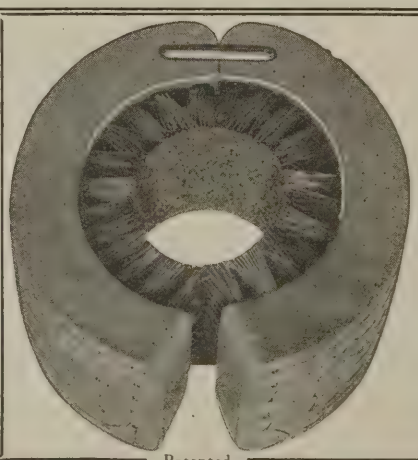
Milk fatted poultry shows a dressed shrinkage higher than in other stock not fed on special feed.



On the assets side we take up the cash on hand, cash in bank, and accounts receivable, divided into four branches, customers, agencies, branches, and miscellaneous, and the notes receivable and the inventory which covers all commodities in the various lines of the business and then we have the capital assets. Under this subject we carry the plant and equipment at the first of the year as one item and the additions made during the current year, and they are taken up as additions to each kind of equipment so we can tell any time how much money we have invested from a capital asset standpoint.

Under this we have additions to equipment, creamery plant, ice cream cans, cream cans, moulds and packers, milk, ice, that is milk equipment and ice equipment, automobiles, horses, wagons, poultry equipment, general factory equipment, cheese equipment and building, and we have the investments in bonds or investments in other companies, and we have the preferred charges consisting of insurance premiums, interest paid in advance, station rents, prepaid freight, dividends paid, and advertising. This makes up practically all of the preferred charges.

The advantage of having a yearly comparison is so we can tell how to compare this year with the last in the way of investments and assets and accounts receivable.



On the liabilities side we have the capital stock, mortgages and current liabilities. The current liabilities are outstanding checks, vouchers payable, accounts payable, notes payable, accrued pay roll and branch house accounts payable. This is handy in comparing current liabilities with last year's and also against the assets or liquid assets, and then we have the reserves, which depend on the nature of the business, of course, consisting of cream can maintenance, cream station maintenance, creamery equipment maintenance, ice cream equipment maintenance, cheese equipment maintnance, milk equipment maintenance, ice equipment maintenance, poultry equipment maintenance, power plant equipment maintenance, building equipment maintenance departments, ice cream packer and can maintenance, office furniture and fixture maintenance, depreciation, taxes accrued, doubtful accounts, interest accrued on notes, interest accrued on mortgages, interest received, discount received, junk sales, auto, horse and

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS

A battery of Elyria Pasteurizers and storage tanks in the Crane-Ohio Milk Co., (Moores & Ross), Columbus, Ohio

This installation is representative of the quality of Elyria work in Ice Cream plants the country over. A systematic, continuous operation which saves floor space, increases plant capacity and which can be handled rapidly and easily with fewer men.

"Upkeep has been practically nil and depreciation likewise"

—CRANE OHIO ICE CREAM COMPANY

LOW up-keep cost and slow depreciation are only two features of Elyria Glass Enameled Steel Equipment which recommend it for the use of Ice Cream manufacturers.

For instance, here's what Moores and Ross say in addition to the above: "They are economical both from the standpoint of pasteurization and storage of mix at low temperature. We will be very glad to show our installation to any Ice Cream manufacturer who is interested for we feel we will be doing him a kindness."

What Elyria tank construction and Elyria installation methods can do for other plants they can do for yours. Clean, sanitary glass enamel — the highest type in the world — insures flavor and purity of product; seamless one-piece steel tanks guarantee strong, sturdy wear and practically no depreciation; mechanical improvements save time, labor and inconvenience, while the systems under which the tanks are installed by experienced dairy engineers save floor space, increase plant capacity and speed up operations.

Free Booklet

This illustrated booklet on Elyria Equipment for the Ice Cream plant, together with a complete description of the Elyria Pasteurizer, will be sent to you upon request. Write today.

An Elyria engineer has the proof of Elyria superiority. He can demonstrate in your own plant the operation of any tank and can show you with facts and figures how Elyria equipment will save you money.

wagon maintenance, and we have the surplus, undivided profits, and profit and loss. I might say the Mutual Creamery Company has a system somewhat similar to this. Their accountant was with some of the concerns I was with in the East, and he adopted some of their system and I have taken some of their ideas and worked up some of my own. I think I have a better system than they have. (Applause.)

Mr. Dunne: Are there any questions?

Mr. Swanberg: What you have been saying there about the bookkeeping, I am speaking about the ice cream business, and not for the others at all, but what you have been saying there is for large concerns. It would be the proper thing to have for a large concern, but how would it do for a small concern that was just starting? Will it not be too expensive for them to go into all these little details in the business? Would you suggest that a man for instance who sells ten thousand gallons a year could use a bookkeeping system as elaborate as that?

Mr. Terwilliger: With a small concern, several things are to be taken into consideration. You must have a foundation upon which to build. I believe the accounting of any business is one of the most vital things you have to consider.

I would say this, that if the concern is too small I would not go into so much detail although I would keep the essential factors. I believe in adopting a system to meet the needs of that business instead of trying to make the business come to the system.

Mr. Swanberg: That was my opinion, and I wanted you to verify it. Thank you very much indeed.

Mr. Dunne: Are there any other questions? Would anybody like to ask Mr. Terwilliger any other questions?

Mr. Terwilliger, on behalf of the Association, I wish to thank you for your very excellent address.

(Whereupon a recess was taken until the hour of two o'clock P. M.)

* * *

AFTERNOON SESSION.

(The convention was called to order by the President at 2:15 o'clock, and the following proceedings were had):

Mr. Dunne: To those of you who were here at two o'clock I want to express my thanks. To the rest of you I would like to say what I think about it. It is now a quarter past two.

We will first hear a representative of the Anti-Blue Law League who is here and who wants to say something to you, and I am going to ask Mr. Wilde, of the Anti-Blue Law League, to come forward and talk to you at this time. He wants to talk to you about the purposes and work of the Anti-Blue Law League. (Applause.)

* * *

ADDRESS BY MR. ALBERT L. WILDE.

Mr. Albert L. Wilde: I appreciate very much the opportunity of coming before you and telling you something about our league.

Most of you cannot have failed to observe the tendency to adopt restrictive laws throughout this country. It has not made itself felt so much in the Western States as it has in the East and South, where nearly everything in the line of amusements and a great many commercial enterprises have been closed upon Sundays.

The laws not only interfere with business enterprise but with private rights of American citizens. To check that and to overcome this tendency the Anti-Blue Law League is constituted. It was conceived and founded and large contributed to by a bunch of newspaper and publicity men, men who are pretty well up on what is going on in the country and who can see what is coming.

The organization has united with it many commercial and industrial enterprises, fraternal organizations and other organizations for the purpose of combating this restrictive legislation. All such commercial interests including the ice cream industry, candy makers, moving picture people, are all vitally interested in this matter. They may check that tendency for a little while, but there must be a determined resistance made or these people will prevail. Unless we are as well organized as they, their well-organized minority will win.

The only way to overcome it is through an organization of the voters. It must be apparent to you gentlemen that an organization such as this that takes in all branches of the enterprise, and other organizations will be able to deliver more of a punch in such legislation than can one organization going it alone. I think it would be to your interest as a commercial enterprise and a manufacturing association, to become members of the Anti-Blue Law League.

We propose to put on record all candidates for legislative and executive offices before they are elected. We are going to keep our membership informed on all points involved in the fight and tell them what we are doing and for what candidates they should vote.

The members of the Anti-Blue Law League are going to be represented before all law-making bodies, whether they be city councils, state legislatures or the United States Government.

There has been a good deal of legislation adopted

throughout the various states affecting your business directly.

We started out with a bulletin under which we get the news daily as it happens throughout the United States.

I want to read one or two items that came through the Bulletin. Here is one under date of August 11, 1921, which reads:

"For delivering bread on Sunday, Henry Ludwig, 19, of Hoboken, New Jersey, was arrested Sunday by Jersey City Police. He will stand trial in the Sixth Precinct Court."

Here is another: "Gergen Point Amustment Park at Bayenne, New Jersey, has evidently been closed on Sundays, for good, and Manager E. Geise, of the park, is threatening to close the resort through all days of the week. He has sustained tremendous losses through Sunday closing, as he had added improvements to the park the past winter that were very costly. This is another bit of Rev. Craft's work."

"The blue laws of Virginia prohibit the sale of soft drinks and ice cream on Sunday. The city officials of Petersburg, Va., recently issued orders to the management of Wilcox Lake to stop the sale of these articles on Sundays. Undaunted, the beach management secured a license to sell ice tea, milk and sandwishes on Sunday which is permissable."

"Ice peddlers in Portsmouth, Va., were forced last Sunday to deliver their ice in absolute quiet. No hawking or noise of chipping ice was permitted. Police followed the wagons about the city. A canvass of all stores that remain open seven days in the week is being made at the direction of City Manager Jervey, for the purpose of enforcing the Sunday law in Portsmouth."

"Pomona, California, was the first city to vote local option on blue laws. Other cities have since been taking this procedure and it is found to be spreading to all sections of the Southern States. All of which reminds us that this is the same method that was followed in the case of prohibition."

Here is one under date of August 18, which reads as follows: "Despite the proclaimed tightening of Blue Laws in Natron, Penn., a suburb of Pittsburg, reformers who persuaded township Commissioners to clamp on the lid on Sunday, were shocked by seeing kiddies running through the streets carrying ice cream cones, and hearing tell of garage men who sold five gallons of gas.

"Absence of an ordinance governing sales halted an attempt to arrest the violators on sight. Not being able to take the oath on Sunday, the commissioners and those who had charge of Blue Laws rejuvenation had to sit back and let the confectioners make money. Nine other stores in the township opened up their shops after noon. Reformers claimed that they are due for a session in court."

"At a special meeting of the city aldermen of Goldsboro, North Carolina, on the night of July 28th, the Sunday 'Blue Law' Ordinance was ordered strictly enforced in the future. Newspapers will be sold on Sunday only between the hours of 8 and 10 A. M. The restaurants will remain open only two hours each for breakfast, dinner and supper. No gasoline will be sold on Sundays. The resurrection and enforcement by Reverends Ham and Ramsey."

Another one on ice cream: "For the first time in 15 years, a crusade has been started in Uniontown and Fayette County, Penn., to enfore the state-wide blue laws of 1794. A petition, containing 300 signatures was presented to the district attorney July 21, requesting the enforcement of the Sunday law, and particularly urging that the sale of newspapers, soda water, ice cream, tobacco, postage stamps and drug sundries, be stopped immediately."

In some places, I think in Ohio, the drug stores are forced to remain open for the convenience of the public, and at the same time they are prohibited from selling anything but prescriptions that might be submitted to be filled. They must keep open although the doing so will cause a loss. Two druggists in that particular town had to put in a restaurant in connection with their drug store so that they would be able to sell ice cream. That is the way the thing is going. They are not only prohibiting the sale of ice cream, soft drinks, and so forth, but they are closing all amusement parks where you gentlemen are affected in a business way. That is the thing that I wanted to call your attention to.

The Anti-Blue Law League has been endorsed by a great many different organizations, both commercial and fraternal, and I would like very much to see you gentlemen here become members of it and I do not think you can help but be benefitted by it.

You are going to have the support of the organizations only who are in the movement. If we get in and try we will be able to overcome the effects of this Blue Law legislation, and I think we are succeeding pretty well to start with.

There have been one or two things come up in the city of Seattle and in the State of Washington since we opened our office a few months ago, and we have succeeded in stopping anything radical being done.

I want to thank you for your attention, and I hope we may have you as members of the Anti-Blue Law League.

Mr. Swanberg: I have known this gentleman for some time and I am much impressed with what he says.

WHEN SHIPPING ICE CREAM BY EXPRESS, NEVER USE A LARGER TUB THAN THE CAN REQUIRES.

I immediately joined this organization. In fact, if I had not known him, or if he had been a Chinaman and had presented this matter to me, I would have signed it just the same. (Laughter.) That is the way I feel. I suppose I will be arrested for saying this.

I have travelled in Europe and over a part of Asia and when I say this, somebody will say that I am not a loyal American, but I want to say that I am as loyal an American as any of you and I would fight for this country as quick as any man in this room, and here is where I have made my living and I have made my living easier and better than I could anywhere else in the world; but I do want to say that we have less personal liberty in this country than in any other country I was ever in. Of course, when it comes to a matter of political liberty, we have as much in this country as any country in the world. We have the right to vote, but we have very little personal liberty.

It is because we are not organized to defend our liberties. If we were, we could have as much liberty as they do anywhere in the world. We can have most anything we desire, if we vote for it.

I think we should join this organization and do what we can to combat these blue laws. Now, if anybody wants to report me and have me arrested, go ahead and do so. (Laughter and applause.)

Mr. Dunne: I would like to appoint a committee to consider this matter and make a report upon it and bring it in tomorrow, whether it would be advisable for us to join this association or not. I will appoint on that committee Mr. Dillabaugh, Mr. Peacock, Mr. Matson, Mr. Stokes and Mr. Booth. And I would like to have them arrange to meet this gentleman, Mr. Wilde. I will make Mr. Stokes the chairman of that committee.

Mr. Wilde: There is only one thing that is going to defeat the Blue Law program and that is the organization of the voters. The thing I am getting over to you is that I want to have your names and addresses on the membership rolls so I can let you know what is going on. You will be more than satisfied.

Mr. Dunne: We formed an anti-blue law league in 1912 in Portland and Mr. Mickle was in the legislature and he will remember we got in and defeated the Sunday closing law by a large majority.

The ice cream men have been very closely affiliated in this work with the moving picture men. They were going to close the theatres and the next thing they were going to do was to close up the ice cream parlors and we had a meeting with the moving picture men and for the first time we found out that they were human beings just like we were, and we swept the old law, passed in the State of Oregon in 1864, into oblivion by a majority of thirty-one thousand by popular vote. (Applause.)

Mr. J. D. Mickle, who was formerly the Food and Dairy Commissioner of the State of Oregon, and at present the Secretary of the Oregon Dairy Council, is here and he has been handling some very effective work, and I would ask Mr. Mickle if he would be good enough to come before us and tell us the benefit he has been able to secure, and many here will testify to the work that the Dairy and Food Commission is doing.

* * *

ADDRESS BY MR. J. D. MICKLE.

Mr. Mickle: Mr. Chairman and gentlemen of the convention: I have boiled my paper down for the reason that I have been listening to heavy articles yesterday and today and I do not wish to tax you further or weary you along that line.

I am going to speak to you this afternoon along the line suggested by Mr. Dunne as a man who has worn official harness, but has now laid it aside, and therefore I feel that I can speak upon some things that I could not othrwise touch. I am to speak to you upon "Observations."

I have purposely used this title for the reason that the little I know of the ice cream business has been gleaned from observation instead of from actual contact with the industry.

However, I have had eight years of official service during which time I have had opportunity to come in touch with many sides of your work, and it is with deep satisfaction that I can review those years and say that my official contact with the ice cream men of my state is one of my most pleasant remembrances.

When I was green in the work, they were patient with me; when I did not understand their point of view, they did not seek to dictate to me nor to influence me through outside pressure. I shall always believe that they had confidence in me that I wanted to do right, and, looking backward now, I can see the wisdom of their actions.

Nine years ago the sanitary conditions in many plants was not what it is today—Doctor McCollum severely criticised the the ice cream men for lack of sanitary conditions in their plants, and in reading it the thought came to me that the Doctor had not investigated ice cream plants in the West or he would not have been so severe in his criticisms. He is the highest authority on dietetics in the country, and I believe if he had made an inspection of our western plants he would have had a different viewpoint; I mean the ice cream plants of to-

day in the West, because I believe that the sanitary conditions of any of the western plants today are ahead of any other sections of the country. I am not saying that because I am talking to you gentlemen, but that is my actual belief, and I do believe we can find plant after plant in the West where their product coming out of that plant is eligible to be set on the table of any man in the land and no one will receive any deleterious effects therefrom, because it has been diligently guarded throughout the manufacture and the distribution.

Therefore, you fellows in the East, if there are any of you here from Chicago, for instance, while I believe there is ground for Doctor McCollum's criticism of the product as I found it in the city of Chicago—you may have good cream, and I do not say you have not—but I unfortunately did not know where to go to get it. But I can take him through many of our plants in the West, and speaking honestly before the American people, he cannot make any such assertion against the ice cream industry in our part of the country.

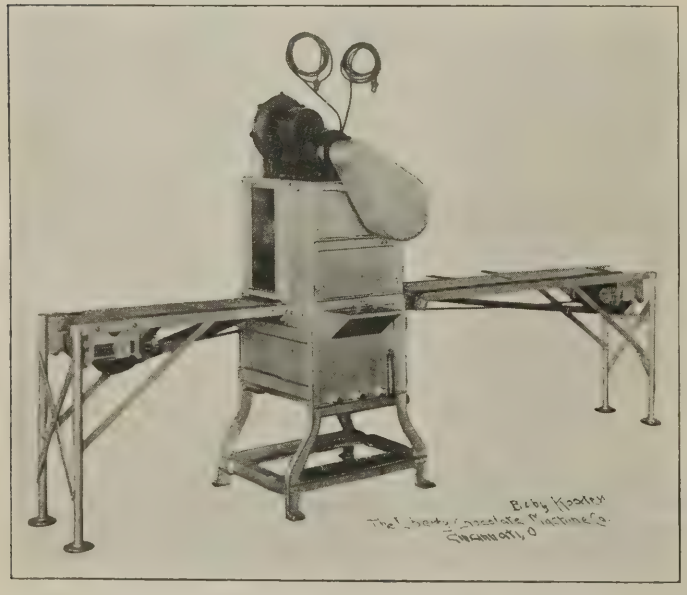
But each succeeding year has brought its uplifting changes and improvements and may I pause to ask, who can foretell what the next nine years will bring? About the time the homogenizer was just coming into general use, and some officials opposed it seriously upon the grounds that it opened up the way for the use of inferior products. Luckily I was not among that number for I had confidence in the men who were using it in my state, and I felt that they regarded the business too highly to allow unsuitable products to enter into the composition of the ice cream being made and in that I was right.

I said I was green, and needed education and for that matter, so does every man who enters upon the activity of food law enforcement, before he can become a fair, efficient official. Too often through an excess of zeal the official does more harm to the industry or plant which he seeks to set right than he does good to the public, for "to err is human."

You know we have in this country a system of election and it is a sort of an unwritten law that a man should succeed himself for the second term and then should step aside.

That may be all right as a general rule applying to political elections, but, friends, that never should apply —I am speaking from experience—to the men who enforce the food law regulations.

I do not care who the man may be or how well qualified he may be when he goes into that work, if he be the right kind of a man and if he has the right conception of his duties, two years in the work will make him more efficient in protecting the public and giving justice and fair play to the manufacturer whom he should represent as well as the public. (Applause.)



There is a saying that no man can serve two masters at the same time. The man who is going down the line right in the matter of food control work does not have two masters. He only serves one master, and that is to do the right thing, the right thing both as to the producer and the consumer, the right protects the people and also the producer, and if the manufacturer is in the right on any particular point, he is on his side. If he is not in the right, then that official has plenty of justice and plenty of public opinion on his side to go out and set him right. He must judge properly and accurately and fairly whether or not the manufacturer is in the right or in the wrong.

If there is anyone here present who has served in public office, you know I am speaking the truth when I say that the man who serves the public as a public official, is skating on thin ice most of the time, because one misstep on the part of him who serves will disgrace him forever, and there is no charity in the voice of public opinion. It will overlook and condone certain things but the conduct of a public official it will not overlook when he makes a misstep. He is man skating on thin ice; when he sounds out public opinion he is going down the line with that light before him, and in that I am reminded of the quotation of our great ex-President Theodore Roosevelt when he said that it is better to be faithful than famous, and if he had that before him, that man need not feel that he is on thin ice.

In regard to the fat content of ice cream, I needed to be and had to be educated to the fact that an eight per cent. standard was more preferable than a twelve per cent. standard. I wrote the first law in Oregon covering ice cream and used twelve per cent. content. Later an amendment was introduced reducing the legal content to eight per cent., in which I assisted in having enacted into law. I have no figures bearing upon the production of ice cream ten years back but only yesterday I had occasion to look up certain dairy statistics for 1919 and 1920, and I am wondering how many there are here who realize the extent to which the ice cream industry has grown, and how it compares with other branches of the dairy industry.

Quoting from the Butter, Cheese and Egg Journal of August 24, 1921, I find that there was produced in the United States in 1919, 230,000,000 gallons and in 1920 an increase of 13%, or 260,000,000 gallons. That the ice cream industry consumed almost as much milk as did the cheese industry and more than one-sixth as much milk as the creamery butter industry and that while the production of those staples decreased in 1920 as against

A GOOD ICE CREAM BRICK CUTTER WILL CUT IN UNIFORM SIZE.

1919, the production of ice cream increased as stated 13%, and that, during one of the most serious periods of re-adjustment that the world has ever known. Why this increase

I believe that you gentlemen know better than I, but if my observations are correct it means a better product, better salesmanship, better delivery, better advertising and better appreciation upon the part of the consuming public. What of the future? That does not come under the heading of "Observation," and to attempt to preconceive is dangerous for in these days we are moving forward so rapidly in business or trade improvement that one can hardly hazard a guess. However, in my judgment there is a great and almost untouched field that will one day be taken over by the ice cream manufacturer and when once he has reached it, consumption of ice cream will double and triple and quadruple. I refer to the great American ordinary family table, where today ice cream is only an occasional visitor or a dessert for special occasions, but one day e're long it will be just as frequently an article of diet as pie or cake, and with better results to the one who partakes thereof, be he youth or adult, male or female. Before this can be brought about, two things will have to be done. First, the invention of some sort of a more practical container, and secondly, cheaper cost of distribution than that of the present. I feel certain that the nearer years of the future will bring both. We have the Thermos bottle that keeps coffee hot from six to ten hours—Why not some similiar sort of container that will keep ice cream cold an equal length of time.

There remains yet another work that must be done before your industry will come fully into its own. Namely, the telling of your story to the mothers of the land, and that can best be done by an agency not directly connected with yourself. We have now an agency known as the National Dairy Council, also various organizations known as State Dairy Councils, created for the exact purpose of telling the value of dairy products in the human diet. In many cities the milk and butter men are using these organizations to reach the consumer, the housewife or the mother, and they are doing it with telling effect. Advertising that cannot be gotten to her by the private individual or the firm can be safely and effectively used by a dairy council to the advantage of all concerned. Already councils have been organized in many states.

Now, in California, they are doing great work in their council there. There was a survey of the situation among the school children in the city of Los Angeles covering 55,000 children and it was found that the milk drinking children among those are far ahead of the non-milk-using children. This work was done by the California Council. The Oregon Council has also done some very good work and they found that only one-third of the children in the State of Oregon were not drinking milk. The consumption is under one-half a pint a day. Every child should be taught to drink a quart of milk every day to say nothing of the ice cream that should be consumed. Instead of drinking milk and eating ice cream as they should, they are going to the stores and spending their money for other things other than our products.

Not long ago a woman came into a grocery store and was accompanied by her little child and she said to the little child, "You have not had a thing for breakfast and you must not go to school without eating something; here, take this and buy you an all-day sucker." (Laughter.)

Do you not think there is a field in this country for the telling of our story, and do you not think it can be done in a way to more directly appeal to the people to whom our message should be sent?

For the last ten days I have stood in a booth at the great stock show in Portland, telling the story of the value of milk and mother after mother have come up to the booth where I have been working and where we show by charts the constituent parts of milk, and they have said, "If we could get milk like that, we would use milk." And in many cases they think that a portion of the fat has been extracted, when as a matter of fact all the outstanding distributors in the city are distributing four per cent. milk while the law requires only three and two-thirds per cent. milk and in this state it may be a little higher, but there is a misconception on the part of the consumer.

We must get close to the consumer in order to show them that we are endeavoring to assist them in the upbringing of the coming generation and are as much interested in their future as any people in the world.

Doctor MacCalum points out that the California Japanese are far superior to the native-born Japanese simply because they have become accustomed to the American diet and some of the Japanese children born on this coast are consuming much the same diet as the American children and they are developing into a much better type of human being.

I say this will be done and that it will come about through these great organizations, and the National Dairy Council is training and sending out special workers to go up and down throughout the land and spread the truth among the people about milk products. We

hope to see the day when Washington and Idaho will join us in this movement and in the end that we may thoroughly cement together dairymen, creamerymen, cheese men and ice cream men—in fact, any and all who may have anything to do with the production and manufacture of real dairy products.

I thank you. (Applause.)

* * *

Mr. Dunne: I knew that J. D. would give you a good talk. He was formerly dairy and food commissioner of the state of Oregon and is now the secretary of the Oregon Dairy Council. Is there anybody who would like to ask Mr. Mickle any questions about the organization and purposes of the dairy council? I have the honor of being the president of the Oregon Dairy council.

Mr. Swanberg: I would like to ask a question. Do you not think that prohibition has done a great deal toward the use of ice cream? The young men used to take the girls to the restaurants and have an oyster supper and so on with wine and now they are taking them to ice cream parlors. Do you think that is where the increase has come in?

Mr. Mickle: That is a hard question to answer here. If I would attempt to answer that question, it would be only my own personal opinion and I would have to generalize a little. I have been married twenty-five years but I do buy ice cream occasionally for my family and my boys and girls when I take them out, but I do believe that taking a serious view of your question, that you are right. I believe people are becoming more and more educated along the line that ice cream is not a luxury but a food.

We have to get away from the idea that milk is a beverage and learn that it is a food. When you look at these things and view them in the same light as you would an all-day sucker you are certainly making a mistake of course. We shoud let people know that when they are taking ice cream into the body they are taking a very excellent food into the body and change their ideas in regard to it, and I think that will increase the consumption of ice cream very materially.

I had hoped that there would be some questions along the line of organizing a dairy council in the state of Washington. You men of Washington and the other states need it very badly.

Mr. Thompson (of Newport): I had the same thought in mind, but I would not have any idea how to go about it to organize such a council.

Mr. Mickle: The first thing to be done is to call together those interested in an organization of that kind and proceed to an organization. You should call together the manufacturers.

Mr. Dunne: Tell them what kind of manufacturers you refer to.

Mr. Mickle: Those manufacturing milk products, milk, ice cream, butter and cheese manufacturers.

In Oregon they are all contributing. However, a number of milk dealers in the state are withholding from the dairymen. This is legitimate work because it is protecting his industry. The farmers are slow to take up with any such thing as we have been speaking of. There is one per cent. taken from the farmer, one per cent., and that goes to the support of the work. Ice cream men are supporters of the council.

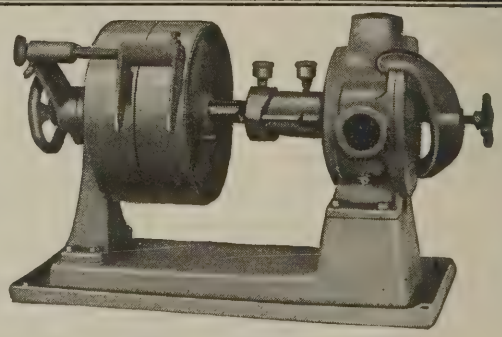
First the work was launched during the war, and because of the slump that took place later, we are still feeling the effects of the getting rid of cows about a year ago and it will take some time and effort to fully rebuild our industries.

We went to everybody interested, even the bankers, and the cheese and creamery men, and asked them to contribute fifty dollars for a membership for a period of three years because there is no use to do flash work carrying on a big campaign for a certain length of time and then dropping it; it must be permanent. And we ran that subscription over a period of three years and many bankers contributed and we collected a fund of five thousand dollars to launch our work with and the subscription was to be paid either in cash or in one-third payments, one payment falling due each year. And we started our work that way.

Since that time it has been carried on by representative industries. You should not attempt to tax an industry outside your own line to build up your work. The dairymen should come in and the manufacturers and if you are interested in any of these industries you should certainly contribute and do your part. The farmer is the last man to be interested because he has not so close a touch with the business affairs as he should have.

The business men are more alive to the actual conditions. Call them together and start a nucleus and then go ahead.

As to the building of the industry, that remains for yourselves to work out.



Mr. Fisher: I would like to know if you would be willing to assist us in the state of Washington?

Mr. Mickle: Oh, yes, certainly.

Mr. Swanberg: I heard you say that the farmer was not as much interested as the business man.

Mr. Mickle: I do not mean to be understood that he

FANCY FORMS MAKE "SPECIAL DAY" ICE CREAM SERVING POPULAR.

is as much interested, but that it is harder to make him see that he is interested.

Mr. Swanberg: I am very much of a farmer myself and a dairyman also and a producer of milk, and I think that I am more interested in it as a farmer than I would be in any other way.

Mr. Mickle: You should be. You are right, but you are interested as an individual, but not as a class. There is the trouble.

Mr. Swanberg: It is time the farmer woke up. The dairy interest is the most important industry we have. I have a dairy and I consider that such work is the most essential for the farmer, and I think it is necessary that the farmers have cows principally on account of the manure that is produced. The most essential thing on a farm is manure and the application of it.

A Member: I would like to know whether you have indulged in advertising?

Mr. Dunne: We have thirty thousand dollars' worth of advertising in one year.

Mr. Mickle: Yes, and today we are publishing a paper. At one time we sent out as high as twenty thousand, going once a month directly to the homes; not a newspaper but a little leaflet carrying concrete information to the housewife which she will read.

If you hold the thing down to a little four-page sheet and make it snappy and tell things of interest concerning your business, delivering it to the door-step of the housewife with the milk or something like that, you are getting in the center or the heart of the matter. If you can get the mother to read those things, of course that is the most effective advertising you can possibly do.

Another thing which our council did and which I think there is a wide field for, there was a time when differences arose between certain milk producers and distributors in Oregon, and that difference was settled up between them by our organization. Our organization represents no particular branch but it represents all of them and it is a big help in clearing up such matters. I want to say that I served the state for eight years as an official, but I would rather today have the honor of going out among the people of the state and telling them this story than to hold any public office.

I went to every parent-teachers' club and woman's club that I was able to attend and spread this program of education, and there is no job you could give me that would suit me any better than to be able to go out and tell those women our story. (Applause.)

Mr. Dunne: I have been president of the Oregon Dairy Council, and I can state that every word that Mr. Mickle has said is absolutely true.

We had a terrific fight that he speaks of and he was the better part of two weeks getting them together. We had men like George Weatherly who spent all of their time in clearing the matter up and I tell you it was a pippin of a fight; but we succeeded in straightening it out.

Mr. Dreyer: How much did you ask the ice cream men to contribute?

Mr. Dunne: One-half cent a gallon and we are asking the milk distributors and the farmers to contribute one cent a gallon and we are asking the butter men to pay one-eight cent, and I want to tell you the butter men are not worth a damn. We have not been able to get anything out of them, and we are fighting their battles all of the time. We went before the State Legislature and put laws across for them, but by-and-by they will wake up and they will be our biggest support.

A Member: There is no creamery organization here in the State of Washington, is there?

Mr. Dunne: They have an association that they have had for thirteen years and the present one has been in existence for thirteen years. I think they had one before that. I should say existed as that it has been doing up to this time.

I want to call your attention to one thing while I think of it. Mrs. Mitchell, a lady of the entertainment committee, said she would like to have all of the visitors let them know what can be done for them as they are willing to do anything in the world to make your visit a success. And in answer to that, one of the ladies said, "I would like to be able to get to that smoker tonight," and Mrs. Mitchell said, "I have been trying to do that ever since I have heard about it, and I have not been able to get in yet."

I will now call on Mr. Brown of Payette, Idaho, who will talk to you about conditions over there. While conditions will not warrant a very big paper, he will in a brief way tell how things are over there. Mr. Brown of Payette. (Applause.)

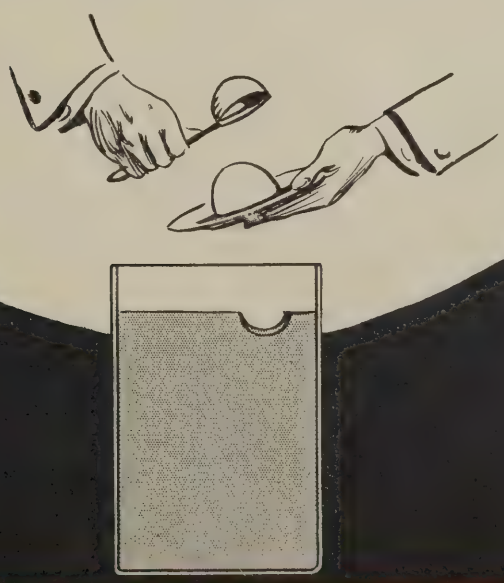
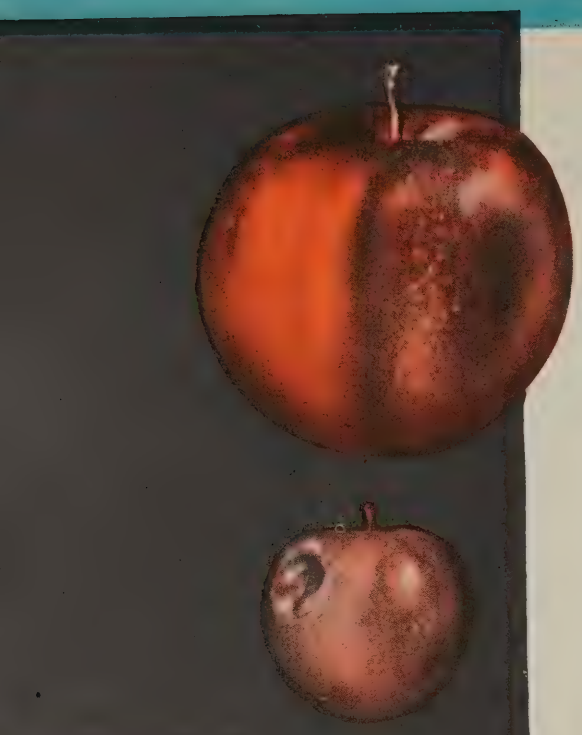
DALLAS FIRM INCORPORATES.

The M. B. Ice Company was recently incorporated at Dallas, Texas, with capital stock of $250,000. The incorporation followed the consolidation, with took place a few months ago, of the Smith Ice Cream Company and the Crystal Ice Cream Company. The firm has added new machinery, including a vacuum pan, and are operating in the building formerly occupied by the Crystal Ice Cream Company. They will manufactuer both brick and bulk ice cream but will not handle other dairy products. A. Brauer is manager of the plant.

Textor for Water Ices



WITH TEXTOR you can make water-ices that will keep for weeks without a sign of icy crystals, or separation, or watering down—you can make water-ices that dealers can repack repeatedly until every last bit is sold. And these water-ices have a velvety-smooth, firm body and an even texture. They are absolutely without grain, they ***never*** contain icy crystals, their consistency remains perfect and they ***never*** separate.



With TEXTOR your water-ices will easily pass any reasonable test you care to make. They will positively permit melting down and repacking a dozen times. They can be shipped to any distance with the assurance that they can be repacked on arrival, and when the can is opened, the water-ice will be perfect.

To make water-ices more tempting and to provide that variety of flavor that is so essential to the development of the sherbet and water-ice industry, we have prepared a TEXTOR book of receipts.

Write for your copy today!

S. GUMPERT & CO.
BUSH TERMINAL, BROOKLYN, N. Y.

Just as scientifically prepared soil gives the farmer finer, tastier apples,

Just so does Gumpert's Improver give the manufacturer smoother, richer, tastier Ice Cream.

WHAT counts in making ice cream rich and tasty is not only the ***percentage*** of butter-fats but also how thoroughly the butter-fats are distributed.

In milk and cream the fat-globules are "encased" in milk solids. The ice cream can't get the benefit of the fats until the "encasing solids" are broken down. Ripening breaks them down—but does it slowly.

Gumpert's does it, too,—but far ***faster*** and far more completely. Gumpert's frees a ***larger proportion*** of the butter-fats, permitting them to spread more fully and evenly through the ice cream. That's what gives a richer, creamier, more satisfying taste.

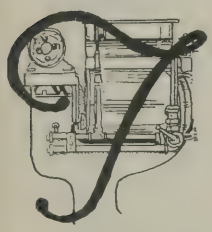
Under the magnifying glass ice cream in which Gumpert's has been used shows a smooth, regular texture.

Why ice cream made with Gumpert's tastes "smoother"

THE "feel" of ice cream in the mouth depends on how small, regular and numerous the air cells are. If the solids in the mix are not thoroughly ripened, they will be firm and hard. The air cells must necessarily be formed large and irregular.

Gumpert's softens the solids and makes them more porous and open. Consequently, when the air is whipped into the mix the cells formed are of just the right structure and arrangement to give a high degree of velvety smoothness. Over 2000 Ice Cream manufacturers regularly use

Much ice cream, while made of excellent ingredients, does not taste as rich, or as smooth as it could, because of insufficient aging.



GUMPERT'S Ice Cream Improver

SPECIAL SECTION

Mixing---Freezing---Hardening

THIS Special Section of the Ice Cream Review, devoted to the Mixing, Freezing and Hardening of ice cream, contains information which is of real value to the ice cream manufacturer. We invite your special attention to it.

We have appealed to hundreds of ice cream manufacturers in all parts of the country to give us their experiences and we are passing the information on to our readers with the conviction that we are giving them something that could not be secured in any other way.

All will agree that the ice cream mix is a very important factor in making ice cream. Other conditions being equal the ice cream mix determines the quality of the finished product. For obvious reasons we have not included a discussion regarding the composition of the mix. We have touched only upon the mechanical elements entering into the mix problem. These are important because the handling of the mix is quite as important as the mix itself.

In touching upon the methods used by various manufacturers in mixing, freezing and hardening of ice cream we have touched upon the very heart of the ice cream business. Here are where the manufacturer's greatest problems lie. We believe he will appreciate knowing how others are handling these problems.

In order to cover these subjects in the most practical manner we submitted a list of questions and have made compilations from the answers which appear on the following pages. The reader can not fail to gain the impression that ice cream making is a real science and that ice cream manufacturers are fast improving their methods. Progressive men are making rapid advancement in establishing the business on a high standard and are consequently reaching out for every new idea that promises to further develop the business. The list of questions submitted is as follows:

* * *

Mixing

Do youpasteurize your mix?.....

Do you put all ingredients in and then pasteurize?.....

Do you test mix for acidity?.....

If so, what acidity do you find produces best results?.....

What method do you use in adding Gelatine?.....

When is flavor added?.....

Do you use an "improver" of any kind?.....

Do you use a homogenizer, viscolizer or emulsor?.....

If so, at what pressure do you homogenize mix?.....

At what temperature?.....

How long do you age mix?.....At what temperature?....

At what temperature does mix go to freezer?.....

What type of freezer do you use?.....

Do you put **exactly** the same amount of mix in freezer each time? .....

Freezing

What brine temperature do you find most satisfactory?.....

What time do you use in freezing?.....

At what temperature do you pull ice cream from freezer?..

Are brine lines to freezer covered?.....

Do you cool over a surface cooler?.....

If you are freezing with ice how much ice (by weight) do you use per gallon of ice cream?.....

How much salt?.....

How much ice do you use to pack 5 gallons of ice cream?..

Hardening

How long after ice cream is pulled from freezer does it take you to get it into hardening room?.....

What temperature do you try to maintain in the hardening room? .....

How long does it take to properly harden your ice cream?...

How is your hardening room insulated? (number of inches and material) .....

Do you use ice or refrigerating machine for hardening room?

Do you prefer Still Hardening Room with rack coils, or Ceiling Coils only?.....

* * *

Mixing.

Of over a hundred answers received to the question regarding pasteurization of the mix,only seven do not pasteurize. In some states there is a law requiring the pasteurization of all dairy products, but even in states where such a law does not exist, it is found to be more satisfactory to pasteurize. The manufacturers who do not pasteurize their mix for the most part make ice cream on a small scale only. From this it may be assumed that it is more satisfactory to pasteurize the mix regardless of whether there is a law requiring it or not. It not only retards the development of lactic bacteria, but arrests the growth and development of putrefactive bacteria. These bacteria, while their growth is retarded by the low temperature at which the ice cream is held, are not completely destroyed by it, and where it is necessary to hold the ice cream for any length of time after it is frozen, the effect on the flavor may be quite noticeable. Then too, the heat of pasteurization and the accompanying agitation serves to blend the ingredients of the mix better than where this process is not used.

In about 80 per cent of the instances, all the ingredients were added before pasteurization. The only ingredients which were added later were flavoring extract, sugar and gelatine, and ripener wherever it is used. In no instances were fruits added before pasteurization. Where a homogenizer, viscolizer or emulsor is used this would, of course, be impossible.

Of 109 manufacturers who answered the question regarding testing the mix for acidity, 38 make such a test and 71 do not. A few of those who do not make the test expressed the opinion that they began to feel the need of making such a test, and would start it soon.

Where the test is made the acidity which the different manufacturers found to produce best results varied all the way from 15 per cent to 60 per cent. The average which the majority found most satisfactory was 25 per cent.

The object seems to be to get as high an acidity as possible and yet keep it low enough so as not to have an unfavorable effect on the flavor. The percentage of acidity that gives best results is also affected by the method of freezing and aging the mix.

To insure uniformity in the finished product, and to reduce the element of chance as a factor in getting good ice cream, it would seem to be highly desirable to make an acidity test. There are instances, in the case of those who manufacture on a small scale where this would be an unnecessary expense, but practically all indications in these

reports point to the fact that it would be a good thing for those who manufacture on a large scale to make such a test.

In most cases where the gelatine is added to the mix before pasteurization it is dissolved in a portion of the mix or in milk or water and added in a dissolved state. In a few instances it is added dry, either sprinkled in the pasteurizing vat or mixed with the sugar or milk powder. One manufacturer states that in his estimation the addition of gelatine brings best results when it is added in a dry state, but that the present types of machinery make it preferable to dissolve it first. Methods of dissolving vary, and it seems to be an arbitrary matter whether the solution is added to the rest of the mix hot or cold. Various methods of heating the gelatine are used, which include steaming, the use of a jacketed kettle, double boiler or direct application of heat. Quite a few manufacturers find it desirable to add the gelatine solution when the balance of the mix has reached a high temperature, from 120 to 145 degrees. They seem to find that it gives the ice cream better body not to heat the gelatine any longer than is absolutely necessary.

A few manufacturers add the gelatine in a dissolved state, either hot or cold, just before freezing. Several add it just after pesteurizing and before homogenizing. One man stated that this method brought excellent results in his factory.

In one factory the solution of gelatine and milk is pumped from the milk storage room into the heating vat, the temperature of the milk being 40 degrees. This appears to be a very convenient method, and where it can be installed conveniently, might be a good innovation for other manufacturers to adopt.

Flavor in the majority of cases, with the exception of vanilla, is added at the freezer, either just before freezing or when the freezing process has reached some desired state. Vanilla is generally added to the whole mix, and other flavors added to each batch. In only a very few cases is the flavor, with the exception of vanilla, added before the pasteurizing and homogenizing process is completed. Most flavors lose their intensity if they are subjected to heat, and it is hevidently found that they blend with the rest of the mix satisfactorily if they are added at the freezer. Fruit and nuts are usually added when the mixture is about half frozen, which insures their being distributed evenly, and not sinking to the bottom or rising to the top.

In almost all cases it is found to be desirable to add the vanilla in the pasteurizing vat with the rest of the ingredients. The nature of this flavor is such that it is desirable to have it thoroughly blended with the rest of the mix, so that as nearly as possible every atom is permeated with an equal portion of it. Whenever homogenizer, viscolizer or emulsor is used, the vanilla is added before this process takes place.

Manufacturers are almost equally divided on the subject of using improvers, for of 108 who answered this question 55 use an improver and 55 do not. One manufacturer stated that he did not use an improver when he had time to age his mix properly, and another did not use it since he had installed a homogenizer.

Of 111 replies received to the question rearding the use of an homogenizer, viscolizer or emulsor, 96 use one or the other of the machines mentioned and 15 do not use any of these machines. Most of those which do not use them are smaller concerns.

Ice cream making as it is carried on today makes the use of some machine which accomplishes the equalization of the specific gravity of the different elements in the mix and blends them more perfectly and smoothly, almost a necessity. This is especially true where the butterfat content of ice cream is regulated by law, for unless the cream would be kept in a perfectly frozen state all the time until it reached the consumer, the fat globules would tend to rise toward the top of the mass, causing the cream in the lower part of the container to fall below the legal standard. Since homogenizers, etc., have come into more general use, the consumer has evidenced a liking for the smooth, velvety quality of ice cream which has been subjected to these processes, hence it is safe to say that their use will soon become standard.

The pressure at which the mix is homogenized or viscolized varies greatly. One of the controlling factors seems to be the acidity of the mix. The purpose here is to get the most desirable degree of viscosity with the greatest economy of power. It was not stated whether there was any way of determining what pressure to use in each case, but it would seem that by determining the acidity and taking into consideration other factors that have a bearing on the homogenizing process, a definite pressure table could be computed, which would be a measure of economy and efficiency. The pressure with the use of both the viscolizer and the homogenizer varied from 1000 to 4000 pounds per square inch.

In the use of the emulsor, the only pressure that could be given was the number of pounds of steam required to operate the machine, which varied from 50 to 100.

The temperatures at which the mix was homogenized, viscolized or emulsified varied greatly. In most cases it was put through one of these machines directly after being taken from the pasteurizing tank. The average temperature was 120 degrees. It was noted that where the mix was homogenized at a low temperature, 38 to 60 degrees, the pressure was high, in all cases above 2500 pounds per square inch. The temperature at which these processes takes place seems to be merely a matter of convenience.

Where an improver is used,the mix is generally aged from 2 to 12 hours, and where none is used from 18 to 48 hours. In some cases where an improver is used it is necessary to start using the mix just as soon as it is ready, and to continue using it for several days, hence the use of an improver has no effect on the keeping quality of the mix. Even with the use of an improver the mix is often held in the aging vat for 24 hours. Where none is used, only in a few cases is the mix held in the vat for less than 4 hours. It would appear that at least this much time is necessary to age the mix properly.

The temperature at which the mix is held while the aging process is in progress varies from 34 to 48 degrees, the average being 40. The length of time the mix is to be aged has no effect on the temperature of it. In a few instances the mix is aged for from 9 to 24 hours, with the use of an improver in most cases, and is then piped into a cooler where it is held at a temperature just above freezing until it is used. The particular advantages of such a system are not stated, but one manufacturer said the process was very satisfactory.

In almost every case the mix goes to the freezer at the temperature it leaves the aging vat. It may be assumed that in practically every plant the mix is conducted by a pipe line directly to the freezer. A few manufacturers cool the mix to as low a temperature as possible before freezing, but this does not seem to have any effect upon the length of time it took to complete the freezing process.

Vertical, horizontal, direct expansion and brine freezers were in use, with the brine freezers of both types in the majority. Most prominent among the makes represented were Creamery Package, J. G. Cherry, Emery Thompson, Miller, United States, Davis-Watkins and Continental.

Approximately sixty per cent of the manufacturers who answered the last question in this section put exactly the same amount of mix in the freezer each time, some gauging the amount by weight and some by volume.

Some manufacturers put a little extra mix in the first freezer full, to allow for what would be taken up by clinging to the sides of the freezer. Others gauged the amount of mix to put in each freezer by the acidity of the mix, testing the contents of the holding vat and using the same amount to the batch for each vat full. Where fruit was used, in most cases the quantity of mix was regulated to allow for this additional volume.

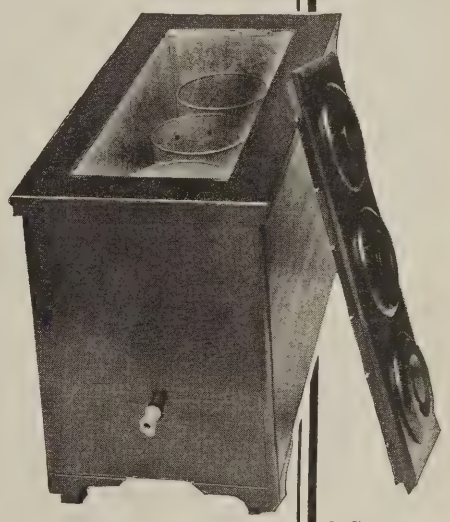
Freezing.

The brine temperatures which the different manufacturers find to be most satisfactory range from zero to 18 degrees, the majority preferring temperatures of 8 and 10 degrees above zero. It appears that the best overrun can be obtained at these temperatures. A brine temperature that is too low will be likely to cause crystallization, which will give the cream a grainy texture, and a temperature that is not low enough may cause churning. The kind of equipment used and the method and ingredients used in preparing the mix are factors which help determine what brine temperature will be most satisfactory.

The average length of time used in freezing is 15 minutes. At a brine temperature of zero, the greatest length of time used in freezing is ten minutes, and at a temperature of 10 degrees the average length of time is 12 to 18 minutes. Where fruits or fruit flavors are used it usually requires a few minutes longer to freeze properly. The temperature at which the mix is put into the freezer does not seem to have any noticeable effect upon the length of time required for freezing. The condition of the mix, mainly the acidity of it, will have an effect upon the length of time required to get the maximum overrun, and as the acidity is apt to vary, especially where no test is made, the time required for freezing will also vary.

Most manufacturers draw the ice cream from the freez-

ECONOMY CABINETS



21-quart Brick Cabinet 32 Dozen Eskimo Pies

Economy Brick Cabinets

The best keeper of Brick Ice Cream or Eskimo Pie. Very heavily insulated and icing space on all four sides of brick container, thus giving perfect refrigeration to each pie or brick. Liner and brick container made of Armco Iron.

Economy Metal-lined Cabinets

Especially designed to keep bulk ice cream at its best quality with the least possible amount of ice. Strongly constructed, heavily insulated and lined with Armco Ingot Iron. Supplied with slip rings to keep can in place and convenient for re-icing. Finished in mahogany.

3 Comp. Metal-lined Cabinet

Economy Tub Cabinets

This separate compartment cabinet is especially designed for rural trade so that one compartment alone can be used without being compelled to ice the entire cabinet. The tubs in these cabinets are especially treated to prevent leakage. Finished in highly polished mahogany.

3 Comp. Tub Cabinet

ers at a temperature of from 26 to 28 degrees. At this temperature it "stands up" properly, and is just hard enough to pour so that it "ribbons." This temperature also is subject to slight variation, depending upon the condition of the mix, the amount and quality of gelatine used, and the length of time the mix is aged. A mix containing very little gelatine or none at all can be taken from the freezer at a much lower temperature than where a considerable quantity is used.

About two-thirds of the manufacturers who replied to the question regarding the covering of brine lines to the freezer had these lines covered. This insulation is an economy which pays for itself in a short time in reducing the waste of refrigeration, and confining the cooling process to the places where it is actually needed. This is especially true where large portions of the pipes are exposed to the air. Where the brine box is close to the freezers the waste of refrigeration is not so great, and insulation is not so essential. The protection to the pipes that is afforded by such insulation is in itself an important consideration, however, and it might be recommended in practically every case.

A large majority of manufacturers cool the mix over a a surface cooler. This process takes place directly after homogenizing, viscolizing or emulsifying, and where none of these processes are used, after pasteurizing. In most cases the mix is piped directly from the cooler to the aging vat. The advantage of using a surface cooler lies in the speed with which the cooling process is conducted, with the consequent retarding of the development of bacteria, and also the saving in time.

Where the surface cooler is not used, brine or cold water is circulated through the coils in the aging vat to bring the mix to the proper aging temperature.

Very few of the manufacturers who replied to this questionnaire use ice in freezing the cream. Of those who did, the average amount of ice used per gallon was 15 pounds, with an average of 2 pounds of salt. One manufacturer stated that after the first run only a small amount of ice and salt was required for freezing each succeeding batch.

The amount of ice used to pack five gallons of ice cream varied considerably, depending on the size of the tub or packer used. The average amount required is 15 pounds to a gallon, making 75 pounds to a 5 gallon tub. One manufacturer stated that it depended upon the kind of cream, fruit creams requiring more ice to pack properly, and also upon where it was to be sent, cream for local delivery requiring less ice than cream that is to be shipped.

One point not mentioned in this questionnaire, but which is nevertheless of importance is the cooling of the cans before filling them. If the cream is put into the warm cans it will melt around the outside and bottom, and this melted cream will freeze into an icy layer when it is placed in the hardening room. Not only is the cream so melted a loss in volume, but it will hardly serve to raise your particular brand of ice cream in the estimation of the consumer to have him get a piece of ice in his sundae.

Hardening.

After the ice cream is taken from the freezer, the object is to get it into the hardening room as soon as possible, to prevent loss of refrigeration, also to prevent the ice cream from settling and losing its light, fluffy texture. The length of time required varied from 10 seconds to 5 minutes, with the majority at 1 minute. Where fewer freezers are in use it takes longer to fill a truck or whatever conveyance is used to get the cans into the hardening room, but in very few cases was the time required longer than two or three minutes.

Most manufacturers tried to keep their hardening rooms at zero or below, some as much as 10 to 15 degrees below. In only one case was the temperature allowed to go above 10 degrees above zero. This temperature is caused to vary by the amount of fresh cream that is placed in the room, but a variation of a few degrees where zero temperature is maintained will have very little effect on the cream.

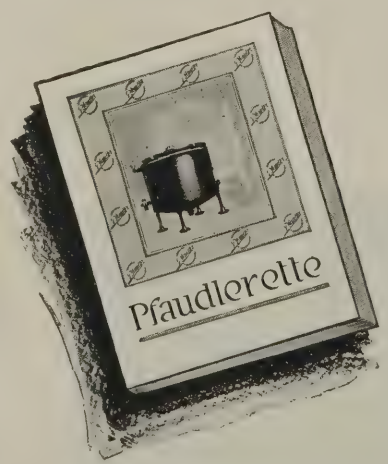
The length of time required to properly harden the cream did not seem to be affected very much by the temperature maintained in the hardening room. The average length of time was 18 hours. In a few instances where the temperature was kept below zero only 8 to 10 hours was required, and likewise, where the temperature was kept at 5 to 10 degrees above zero, a few manufacturers found it advisable to hold the cream from 24 to 36 hours. These instances were exceptional, and regardless of temperature of the hardening room, the above named average held true.

The material in most common use for insulation is cork board. The majority of manufacturers who used this board found it advisable to have it at least eight inches thick. One manufacturer who was using this board in 6-inch thickness stated that he found this was not enough for proper or economical insulation, and that he would have it increased soon. In most cases the cork board was plastered inside and out with cement plaster.

Where ground cork or sawdust is used for insulation it is generally used in connection with cork board, cement or plaster. The average thickness of this layer of loose cork is two to four inches.

One manufacturer who believes in good insulation has a 13-inch wall around his hardening room, consisting of 11 inches of cork and 2 inches of wood, with a thin coating of cement plaster inside. Another man who has the same idea has enclosed his hardening room with a 14-inch wall of cork dust, and has a 19-inch floor consisting of 3 inches of concrete, 3 inches of cork, 1 inch of pitch, 3 inches of cork, 1 inch of pitch and 8 inches of cork. Since cold air goes downward, no doubt much refrigeration is lost through the floor, therefore the proper insulation of the floor is very important.

A few manufacturers use the dead air space in insulating. One manufacturer who uses this principle has a ceiling and walls consisting of 6 inches of cork board and 2 inches of cement with a 4-inch dead air space between. This was boarded and covered with roofing paper. He did not state how satisfactory this system was, but judging from the size and capacity of his plant, it would have to be very efficient.



The use of ice machines for refrigerating the hardening room is almost universal. Of 105 manufacturers who replied to the question regarding this, only six used ice, and these all apeared to be doing business on a comparatively small scale. To harden the cream properly where it is made in large quantities, it is necessary to place it in a temperature lower than could be obtained in a uniform degree with the use of ice. The only way is to place the cans in a tub containing a mixture of ice and salt, known as a "slush tub." This is satisfactory for the smaller manufacturer, but inconvenient to be practiced on a large scale.

Only a few manufacturers use the ceiling coils only, most of them preferring the rack coils where only one type are used, and a large number using both. A few find it desirable to use a fan for circulating the air in summer, for with the hardening room filled to capacity they find it difficult to maintain an even temperature without forced circulation. Rack coils are generally preferred for brick.

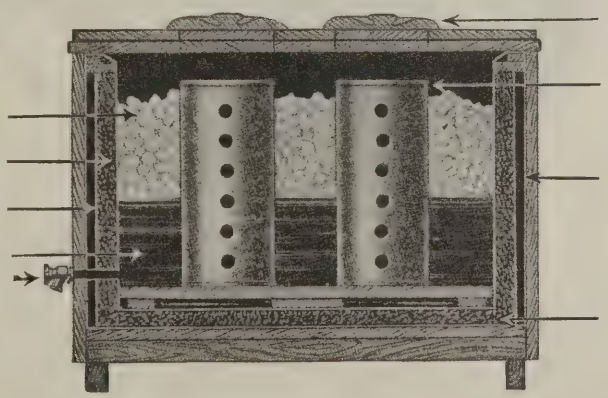
The general consensus of opinion seems to be that for a small or medium size hardening room the still type with rack coils is to be preferred, and for larger rooms some forced circulation is desirable when the room is filled.

SOMETHING NEW IN GLASS LINED EQUIPMENT.

We have just reviewed with interest a little booklet called, "The Story of the Pfaudlerette," and have become acquainted with this newest member of the Pfaudler Company's family. The Pfaudlerette is a small glass lined pasteurizer which, furnished with some differences in fittings can be used either for pasteurization of milk, as a starter can, cream ripener, neutralizer, buttermilk tank, in creamery work, or finally as an ice cream batch mixer-pasteurizer or aging tank. The book is profusely illustrated with pictures of this pasteurizer and its parts and gives some interesting and valuable facts concerning the advantages of pasteurizing in glass. Manufacturers in all lines of the dairy industry will find something of interest in this booklet. It may be obtained free of charge by writing to the Pfaudler Company, Rochester, N. Y.

Would you be Satisfied-?

with an Ice Cream Cabinet if it kept your product in perfect condition from 24 to 36 hours with one packing and saved from 33½ to 50% on your ice bills?



Well, that's exactly what the ice cream manufacturer can count upon when he tries "NoSwets" cabinets. Besides this feature, the NoSwet has made a brilliant name for strength, durability and long life. The materials and workmanship that go in their making are unsurpassed.

Sign up NOW for Cabinet Economy

Buyers today are scrupulously seeking out value, particularly among ice cream manufacturers. Those who have installed NoSwets are giving out-spoken praise and positive preference to our cabinets. Our liberal 30 day trial offer in which we agree to stand the expense of shipment both ways if not perfectly satisfactory, should prompt you to immediately put this cabinet to a test.

GRAND RAPIDS MICHIGAN

CONTI

CROSS SECTION OF CONTINENTAL DIRECT EXPANSION FREEZER

A—Ammonia expanded directly in freezer. (No wear, due to brine scour). You get instant freezing action by merely opening expansion valve A.

B—Absolute temperature control — opening or closing suction valve B regulates temperature at will of operator from zero to 10 degrees above zero.

C—Combination temperature and pressure gauge—instantly indicates temperature maintained in freezer cylinder, thus enabling operator to know exact temperature and to raise or lower it at will.

The other advantages are equally important and desirable

NENTAL

Revolutionizes

Ice Cream Freezing

Here is the peer of all ice cream freezers. Cuts operating cost 50%; increases capacity over 40%—makes a greater swell—more uniform consistency—better quality.

No brine to pump—no power wasted—no time lost. Automatic—ready to freeze your cream instantly, continuously or as conditions require.

You cannot get *all* of the profit possible out of your ice cream without this modern, matchless

Direct Expansion
ICE CREAM FREEZER

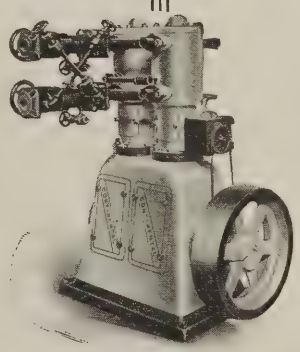
Positively the most distinct improvement ever achieved in the ice cream industry. The facts regarding it may be worth hundreds or perhaps thousands of dollars to your company.

Get the information now—send for Bulletin C-64—mailed on request, without obligation.

Reasons Why Continental Compressors Will Serve You Best

1—High Speed—A wide range of speeds and power with perfect safety—plus Continental ribbon valve and avoidance of oil contamination, guarantees greatest efficiency and lowest cost.

2—Accessibility—Easy to get at all moving parts.



3—Noiseless, trouble-proof, longer life.

4—Compactness—Minimum space, maximum results.

5—Perfectly balanced—Free from destructive vibration.

6—Ammonia Controlled—No ammonia in crank case, or obnoxious fumes.

7—No Oil Contamination—There's never any oil in a Continental Condenser or cooling coils.

Continental Compressors are made in compact, self-contained units, 1 to 3 tons capacity, also in detached units of one, two and three cyliners with capacities of 1 to 60 tons of refrigeration.

It's just good business to get *all the facts.* Why not send now for Folder C-11—mailed free on request.

Will You Have a Large or Small Freezer?

ONE of the ice cream supplymen got so enthusiastic over the large size freezer that he asked us to find the reason for the continued wide use of the smaller size freezers. His query is:

"Why does the wholesale manufacturer of ice cream stick to the old type 40-quart freezer when the large type does the work better and more satisfactorily for the following reasons saves one-half the floor space, one-third the motor power, one-fourth the first cost, one-half the labor, one-half the up-keep and at the same time produces a smoother, more velvety product and a better overrun than any of the smaller types of freezers?"

The men who can answer this supplyman's question are the ice cream manufacturers, and we hope the few replies we are publishing here will help the manufacturers in selecting their freezers and will save the supplymen the time they used ao waste while waiting for the customer to make a decision.

One manufacturer just answered one word, "Habit!" We don't know whether he is speaking from experience or not, but he does know how to say a lot in one word. A reason given in many of the replies to this question was that a large freezer, out of commission, stopped production, whereas a small one merely lessened production. One of the boys put up the argument that if he needed a pair of No. 10 shoes, he wouldn't buy a dozen pair of baby shoes, but would-however, that won't hold water — or even air — so we are giving you some of the replies first-hand. * * *

A Matter of Adaptability.

Reply:—First, I want to ask you if your questioner is sure that the wholesale manufacturer does stick to the forty quart freezer? I have visited a great many plants in the last six months, and in most cases where new machines were being installed they were of the sixty or eighty quart size. It would seem to me from my personal observation that where new freezers are being installed they are of the larger sizes, except perhaps in the very small plants.

For the sake of argument we will say that the forty quart freezer is more popular. I will admit that the larger freezer saves floor space, power and first cost, and perhaps upkeep, but in the average small plant using up to six forty quart machines I do not believe it saves one bit of labor. And as for a smoother, more velvety product, your questioner should tell it to "Sweeney or the Marines."

And overrun—if a man can't get it with a forty quart freezer a larger one isn't going to do him much good.

There are not such phenomenal profits in an ice cream business conducted legitimately that the average manufacturer can junk his forty quart machines simply for the purpose of putting in larger ones. A very definite saving must be shown and guaranteed. Our forty quart machines are giving satisfactory service, and "I'm from Missouri."

There is another thing that comes to my mind as I write that is brought out by experience. A manufacturer must always count on a margin or safety, and the fellow who is installing a freezer capacity of, say eighty quarts, would rather have two forty quart machines than one eighty quart, because if one breaks down, he still will have 50 per cent of his freezing capacity intact. I know of a manufacturer who operates three forty quart machines, and two years ago he had only two of these machines in operation all during the hot months, because one after the other the machines had to be sent to the factory for repairs to the jackets. He would have been in fine shape with one 120 quart instead of his three forty quart machines, wouldn't he?

After all is said and done, the question simmers down to one of adaptability. It would be foolish to argue that a Rolls-Royce—or a Ford, for that matter—is the best car for all conditions and purposes. There are cases where a smaller machine is more economical and more satisfactory than the larger one, and vice versa. So the argument goes on.

* * *

Ignorance of Large Type Advantages; More than One Flavor at Time.

Reply:—Our opinion is as follows:

1. This size is large enough for many manufacturers just starting in business, and no surplus capital available to stock larger machines before actually needed.
2. When gradually enlarging, the addition of one 40 quart freezer takes care of the extra business at the least investment.
3. Smaller manufacturers having two small freezers can have a breakdown on one of them without seriously impairing production, which would not be the case with one large machine.
4. Prevalent superstition (?) that smaller machine does better work, gives more overrun, etc.
5. Ignorance of advantages of larger type (most important reason).
6. Large and so-called model plants generally have been using this size freezer.
7. Freeze more than one flavor at one time.

* * *

Large Freezer Not Suited to Business.

Reply:—My answer is that first we have a complete battery of 40 quart freezers that are in A-1 condition and do not think it economical to junk these freezers for larger type. Second, I am doubtful if the larger freezer would fill out wants as well as a 40 quart freezer, as nearly 50 per cent of our business is brick business and from observation made in plants using the 80 and 100 quart size, I find that there is too big a variation in the overrun of bricks made from 100 quart freezers and the biggest portion of our business is in two and three gallon cans and outside of straight bulk vanilla ice cream we would have no use for an 80 or 100 quart freezer. Furthermore, from observation made, I believe it possible to produce just as velvety and smooth ice cream in a 40 quart freezer as it is in a larger freezer and so far as overrun is concerned, our problem is to keep our overrun down.

* * *

Reply:—We use two 40 quart freezers, instead of one large one, as we are small ice cream manufacturers and

Gentlemen:

You may be interested in knowing that we have received a communication from a firm in Hamburg, Germany, making inquiry as to our services as architects and engineers for an ice cream plant to be located in that city.

They tell us they saw our advertisement in the "Ice Cream Review".

We did not know your paper had such an extensive circulation.

Very truly yours,

THE McCORMICK COMPANY, INC.

WARNING---To Manufacturers

THIS BREAKAGE PROTECTION RING IS PATENTED

SEE ILLUSTRATION ON NEXT PAGE

THE Patented McLaren Breakage Protection Ring has proven itself to be a meritorious and advantageous improvement in ice cream cones.

Several cone manufacturers, without authority from us are manufacturing and selling cones which embody this patented feature.

The laws covering the unauthorized use of a patented article and unfair competition are fairly well known and the NEW LAW recently passed by Congress makes provision whereby the recovery of profits and damages are greatly facilitated over former practice.

Under this new law THE MANUFACTURER, THE JOBBER, THE RETAILER or any other person or firm that, without authority from us, makes or sells cones which embody the McLaren Breakage Protection Ring feature, or which imitate unfairly our patented Design, is LIABLE AS AN INFRINGER.

It is necessary that we protect our customers and ourselves against unfair competition, and we are sending out this general notice to the trade so that no one may innocently become liable to suit through being a party to the unfair practices above mentioned.

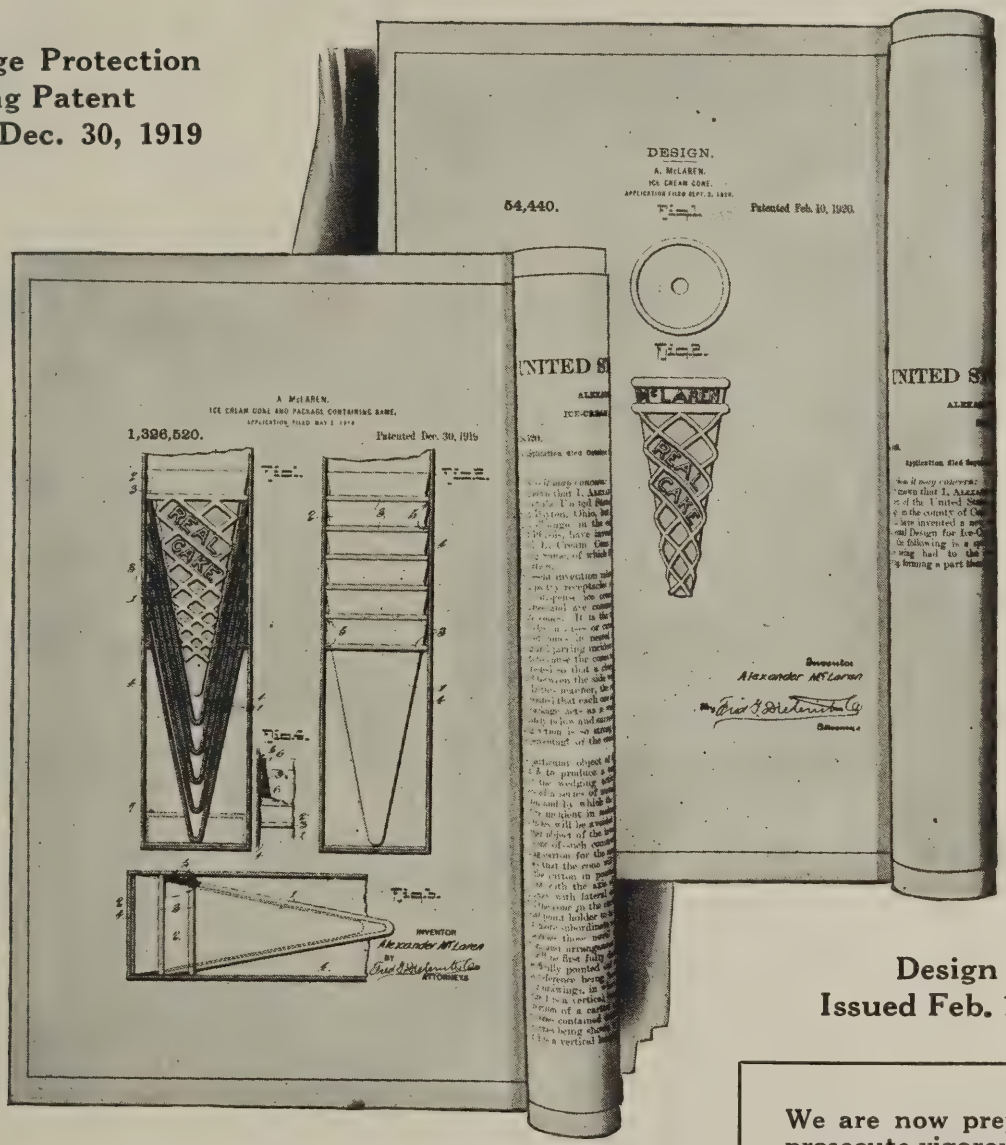
The following concerns, and these only, are licensed by us to use the McLaren Patented Breakage Protection Ring:

THE McLAREN PRODUCTS CO.
DAYTON, OHIO

McLAREN PRODUCTS CO.
KANSAS CITY, MISSOURI

PEORIA CAKE CONE CO.
PEORIA, ILL.

THE McLAREN PRODUCTS CO.



DAYTON OHIO — KANSAS CITY MISSOURI

Are You Handling Cones That Infringe These Patents?

COVER ICE CREAM BARS WITH GOOD CHOCOLATE.

make small mixes and small freezers in the winter time, say 80 to 200 gallons a day and often have 2 or 3 specials to make, which is very easy to handle with small freezers.

I expect one reason why ice cream plants use 40 quart freezers is because larger freezers are very new and have just been out a few years. Everyone has installed small freezers and equipped their building and plants with that special freezer.

* * *

Reply:—As I am only a small manufacturer, I only have one machine and I often have some specials to freeze of two or three gallons which a large machine could not do so well. But if I were using two machines I think the 80 quart would be the thing.

* * *

Reply:—Our reason for making a choice of 40 quart machines is due to our being able to always have more machines in working order. If we used, for instance, an 80 quart freezer and it was disabled, we would be in a bad fix, while if one of the 40 quart size is disabled we can still get along.

* * *

Overrun Cannot be Controlled.

Reply:—In conjunction with four 40 quart freezers, we have been operating one 80 quart and one 100 quart freezer in our plant for a period of about four years. While it is true that a saving in motor power, first cost, labor and space is to be realized from the use of the larger type freezers, we do not find that a more velvety product and a better overrun can be secured from them.

As a matter of fact, we feel that 80 and 100 quart freezers are entirely unsatisfactory except for pulling cream in five gallon cans. This is because of the fact that these freezers must be emptied just as rapidly as a 40 quart freezer in order to prevent increased or decreased swell during the process of pulling the freezer. The larger volume of cream in the larger type freezers cannot be pulled satisfactorily into two and three gallon cans because of the length of time required to empty the freezer, which either results in a loss of swell or too much swell.

Were we to install new freezing equipment in our freezing room, we would buy one 100 quart freezer and six 40 quart freezers.

* * *

Reply:—The manufacturer sticks to the small freezer because it takes so long to draw the mix from a large freezer into small cans that the last end of the batch in a 100 quart freezer might show larger per cent of overrun. Ice cream of more even texture and overrun can be drawn from a 40 quart freezer.

* * *

Expense Must Be Considered.

Reply:—Regarding the use of the old type 40 quart freezer: You mention the fact that the larger types save one half the floor space, one third the motor power, one fourth the cost, one half the labor and one half the upkeep, and at the same time produces a smoother, more velvety product and a better overrun than any of the smaller types of freezers. The greater portion of this statement is correct, insofar as our view-point is concerned. However, our experience has not justified the statement that the larger freezers will produce a smoother, more velvety product. Why should they? The same operation takes place in either case and the body and texture of the cream is not improved by the use of a larger size freezer.

You refer to a better overrun. This again needs ex-

JACK RABBITS

ELWIN F. WEIL, Secretary

514 New York Life Bldg.,

Kansas City Missouri

In regard to the condition of ice cream here in Kansas. The weather has been a little backward, and we have had lots of rain here this season, so the ice cream business has been very slow. But we are getting a bumper of a wheat crop. But now the sun has broken through, and ice cream makers have all they can do. Things are looking very favorable for everybody here in Kansas, and everybody feels like they will have a great season as soon as the weather will allow.

The Kansas Jack Rabbits are jumping from one corner of the state to the other, but they will have a hard time to keep up now that the sun is shining. Best regards.

S. K. JENSEN.

* * *

A DOCTOR.

Mr. A. C. Abel, President of the Impruv-Mix Company of New York is known the country over as an ice cream doctor.

You know, just like a regular surgeon. He takes his patient and finds out what the ailments are, looks up all the symptoms and asks questions as to how it has been acting of late. When he discovers where the real trouble lies, he begins to operate—you know — just like a real doctor. First he removes all the ailments and then sometimes puts in the real parts which should have been there before but have disappeared.

Then after the operation, to improve the health of his patient, "Doc" Abel gives it some medicine in the form of "Impruv-Mix." If "Doc" isn't Abel to make ice cream feel well and get it on its feet and be a selling in a short time, the patient is incurable.

Wonder how many sick ones there are in the country?

* * *

You ask how conditions are in the Southwest as pertaining to the ice cream industry. Your question can be briefly answered by saying that we have had nothing but rain for the past couple of months.

As to the future, we are optimistic. The unemployment situation is improved. Money is easier. Crops, with exception of a few places where they have been washed out by the main, necessitating replanting, look good.

There are very few ice cream manufacturers who have not improved their plant, and all look for a much better season than 1921. It seems that the entire trade is realizing the value of printer's ink and are doing more advertising than ever before. Now that we all are using better merchandising methods and making better quality ice cream, all that is needed is good weather.

KARL R. ZIMMER,
Menasha Printing & Carton Company.

BING!—There Goes the Bottom!

—but the far-sighted ice cream manufacturer has a **Frick Bottom Hoop** handy and in a jiffy the tub is as good as new—and it will last two or three times longer than a new tub of the present type.

Even Uncle Sam's Mail Clerks Interested in Nat'l Exposition

Advertising by Association of Ice Cream Supply Men Puts New Color Into Nation-Wide Mails

THE Post Office Department's several thousand clerks throughout the country are now stopping for a minute to study the red, green and blue small poster-drawing borne on thousands of envelopes going into the mails every day from the hundred member companies of The Association of Ice Cream Supply Men in cities from coast to coast.

The attractive little poster-drawing really has only an incidental interest for Uncle Sam's many mail clerks, for it is intended principally for the eyes of the persons from the Pacific to the Atlantic, from the Gulf of Mexico to the Hudson Bay, who are directly interested in the production and sale of ice cream. To them the little poster-drawing tells a story as important as anything that the year will hold—the story of the great combined Conventional-Exposition week of the ice cream business in Cleveland next October.

"Ice Cream—A National Industry—Come to Cleveland October 16th to 21st inclusive"—the poster-drawing reads, and back of the letters is shown a gigantic ice cream factory with evidence of ceaseless mid-season activity all about it. The little drawing also shows down in one corner the busy, colorful sky-and-shore line of Cleveland, America's Fifth City.

There are many evidences accumulating according to The Association of Ice Cream Supply Men, that the slogan reproduced in the colored envelope adornment, "Ice Cream—A National Industry—Come to Cleveland October 16th to 21st inclusive," is expressive of the dominant spirit of the ice cream industry of 1922.

"If there ever was any doubt that the business of commercial ice cream has become a self conscious, big-visioned, ambitious national industry, according to O. S. Jordan, President of the Association, "that doubt is now dispelled. When one remembers that ice cream is not a commodity essential in the sense that lumber, iron, coal, oil, wheat, cotton, wool, etc., are essentials, but is only a secondary essential, he cannot help but realize, by its present size, the comparatively major national position that ice cream has come now to have in American business life."

Numbers of ice cream manufacturers and supply men who are planning to be in Cleveland the week of October 16th, where the 22nd annual convention of the National Association of Ice Cream Manufacturers will be held October 16th, 17th and 18th, and the National Exposition for the ice cream industry, under the management of The Association of Ice Cream Supply Men, will extend from October 17th to 21st, inclusive, have expressed their early interest by visiting the great Cleveland Public Hall where the National Exposition will be held.

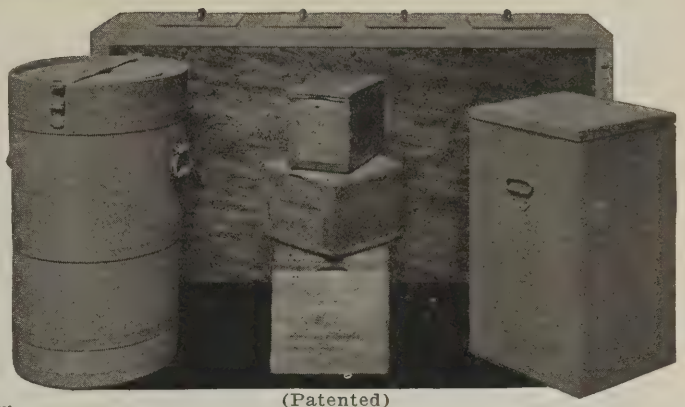
CLEVELAND PUBLIC HALL

One of the outstanding features relating to the exposition, at least as plans and arrangements have been announced so far, in fact, is the exceptional character of this Public Hall.

It is a magnificent fire-proof building, located in the heart of Cleveland's business district and has been designed and built specifically for expositions, conventions, tournaments, concerts and other large gatherings

and pageants. It is, in fact, the very last word both in municipally owned public structures and in architectural provision for expositions and conventions.

The location of the new building is doubly advantageous in that it affords an unobstructed view of the Cleveland harbor and of Lake Erie. It is also within easy walking distance of the principal Cleveland hotels, theaters, retail and wholesale districts, and of the Union Passenger Station. Railway freight terminals are conveniently at hand. It is only two minutes leisurely walk from the Hollenden Hotel, the headquarters of the National Association of Ice Cream Manufacturers, where the 22nd annual convention of that body will be held.



More than 30,000 square feet of space in the Public Hall will be utilized by the National Exposition, according to The Association of Ice Cream Supply Men. The exposition hall of the building is 235 feet long by 121 feet and 6 inches wide, broken only building columns. A very attractive feature of the exposition hall is that the ceiling has 16 feet clearance above the floor.

At each of these building columns is a service station with connections for electric current power or decorative purposes. At many of these stations are also connections for hot and cold water, compressed air, gas, high pressure steam, vacuum, vacumm cleaner and drainage for waste water.

The Public Hall has been several years in construction and was opened for use only two months ago. Its final cost will approximate $6,500,000. Its appointments throughout are the most elaborate and sightly.

The Association of Ice Cream Supply Men has announced that the general enforcement of all exposition rules and the carrying through of exposition arrangements will be in the hands of an Exposition Committee of which K. W. Schantz is Chairman and L. B. Ismon, Albert McDougal, Thomas J. Stewart and Henry W. Stern are members.

Exposition diagrams have already been sent to member houses of The Association of Ice Cream Supply Men. The Association anticipates that many of the displays will have a more pronounced educational character than displays have heretofore.

"DEPENDABLE REFRIGERATION FOR ICE CREAM PLANTS."

This is the title of an interesting, beautifully illustrated, booklet which we have just spent a few profitable moments reviewing. It is issued by the Baker Ice Machine Company of Omaha, Nebraska, giving an interesting description of the freezing, hardening and packing of ice cream by modern methods. One portion of the freezing process which is discussed at length is the "swell," and how to control it. After reading it, one is firmly impressed with the importance of refrigeration in the manufacture of ice cream. To quote the opening paragraph, "Ice cream being a frozen product, refrigeration becomes the principal process of manufacture, and profits depend largely upon an efficient and economical refrigerating system." The competition in the ice cream field today makes it practically a necessity for even the smaller manufacturer to have mechanical refrigeration and the advantages it gives to avoid being crowded out. The manufacturer who uses the ice and salt method of freezing and hardening will find this booklet particullarly interesting. Copies may be obtained by writing the Baker Ice Machine Company for them.

The New Home of The Olsen Publishing Company

This modern building, 100 feet wide and 150 feet long, two floors and basement, is the new home of The Olsen Publishing Co., Milwaukee. It is located at the corner of Fifth and Cherry Streets, close to downtown points and ideally adapted to the publishing and printing business. The building is of steel and concrete construction faced with red brick and is, of course, strictly fireproof. A 50 foot vacant lot to the south, an alley to the west and streets on the north and east provide abundant light and air. In this beautiful, substantial home of our own we are equipped to serve readers and advertisers of our publications, and patrons of our printing department, in a highly efficient manner. Friends are invited to visit us.

PACIFIC ICE CREAM MANUFACTURERS' ASSOCIATION.

Announcing the Seventh Annual Convention.

The Directors of your Association have accepted an invitation from the manufacturers of Spokane, Washington, to hold the next convention in their city, November 13 to 15, 1922, with headquarters at the Davenport Hotel.

The past few months have witnessed innovations which have had a far-reaching influence upon the industry. They have served to emphasize the fact that the business of making and selling ice cream is still in its infancy, and to point out the wonderful opportunities for development.

The future of the business will be what we make it, and one of the greatest incentives to increased effort is to detach ourselves occasionally from our own workshops, so that we can get the OTHER FELLOW'S point of view. A man who builds a house must see it and work upon it from the OUTSIDE as well as the inside, if he is to have a complete and harmonious dwelling. So must we do with our businesses, if they and the industry, of which they are a part, are to have the greatest measure of accomplishment and progress.

Our past conventions have been well worth while, and have contributed materially to the advancement of the industry. With YOUR help and enthusiastic support, we hope to make this the BEST CONVENTION we have ever had. RIGHT NOW, while the matter is fresh in your mind, let us have the benefit of your suggestions as to subjects, speakers, and any other factors which will contribute to its success.

We shall have further announcements to make later as to convention plans, some of which have already been formulated. The purpose of THIS LETTER, however, is to assure you that YOUR SUGGESTIONS will receive careful consideration, and will be greatly appreciated. We ask two things of you at this time:

FIRST—Make a note NOW on your calendar to hold the dates of November 13 to 15 open for the convention; and,

SECOND—Let us have your EARLY RESPONSE TO THIS LETTER.

PACIFIC ICE CREAM MANUFACTURERS' ASS'N.,
W. V. S. Robb, Secretary.

Attest:
Bert H. Walker, Secretary.

HALF RATES.

HE NOW SPECIALIZES IN MANAGING.

By C. W. Esmond.

"I had to lay off from hard work for a year," remarked an ice cream manufacturer in a small city the other day. "But I didn't stop working with my head. In fact, I worked my head as I had never done before, with the result that I had the best year in my history.

"That taught me a mighty important lesson. I have been hiring men to do the heavy work ever since, and

I hire men to do the heavy work and busy myself around the office.

I have been using my head. Of course, I don't hesitate to jump in in an emergency. I'm doing the bookkeeper's work today. But I don't tie myself down to manual work day after day. And I have been making more money and getting ahead faster than I ever dreamed was possible when I was trying to be a manager and a laborer in one."

⚜

TOO MUCH ESKIMO PIE.

Chicago.—Anybody'd think dipping ice cream into hot chocolate would melt the ice cream, Christian Kent Nelson discovered the way to do it, however, at just the right temperature. The result—eskimo pie.

Until he made his discovery Nelson was a poor but contented teacher at Onawa, Ia. Today money's pouring in on him so fast that he's scared. "I want to stay human," he says.

He tried hard enough to market his idea before it "caught on." Most people he approached were skeptical. Finally Russel Stover, of Omaha, went in with him. From that moment the golden tide began to rise. For Nelson, at any rate, it rose too high.

"Money! The more I see of it, the less I like it; I'd rather be with my books, or back on the job as teacher again," he exclaimed. He hasn't even bought an automobile. Perhaps wealth came a bit too fast—about a year, from a shoestring to offluence, is sudden enough to be disconcerting.

Nelson's a graduate of Nevada University. He's only 29. His father and mother are living and he has brothers and sisters. He's unmarried. When a reporter asked him, "Do you intend to take a wife?" "Maybe," he answered.—Pittsburgh Press.

⚜

"Learned men have taught us that not only with a choice of evils we should choose the least, but that from the evil we should endeavor to extract some good."—Cicero.

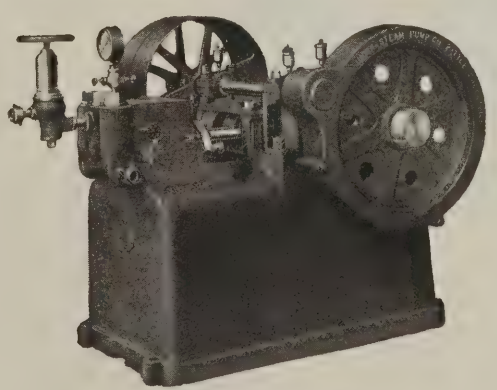
The Viscolizer

"In July and August—When Fresh Cream is Hard to Get"

Hot weather, low cream supply, extra heavy demand—then is when you'll want a Viscolizer. Butter, milk powder, skim milk or water, and a VISCOLIZER, and you may have better cream, in any quantity, any time.

Nothing to worry about.
Nothing to waste.
Always ready to run.
Always works.



As an aid in the making of better, smoother, richer flavored ice cream, the VISCOLIZER is unsurpassed. For stabilizing evaporated milk and emulsifying, it has proved unusually effective.

There is a VISCOLIZER for every possible demand. TheVISCOLIZER is built in five sizes—for the requirements of the Soda Fountain to the largest condensary, where service is exacting and heavy.

In mechanical construction and design, the VISCOLIZER represents the most practical development in its field. Built in the largest factory in America, devoted exclusively to the manufacture of pumps of all kinds, backed up by an organization of specialists who have spent fifty years on scientific pump development.

Write for new booklet just off the press.

Why Ice Cream Churns in the Freezer

Question asked by a subscriber, and replies by ice cream manufacturers and dairy experts

JIMMY used to stop long enough to shout a "Hurrah!" or two when the first little globules of butter showed up around the dasher handle, and then start in with renewed vigor to finish his task. But Jimmy grew up into an ice cream manufacturer and he tells us that the same little grains of butter that used to make him feel so good are threatening to ruin his business because they insist upon appearing in his ice cream freezers in the spring of the year. We gave him some advise and have asked several ice cream manufacturers for their opinions on this subject. We are publishing a few of the replies received in the hope that any other "Jimmies" there may be in the trade will find them valuable.

Question: Our ice cream mix is churning in the freezer and we cannot discover the cause. We handle our mix just as we always have and use the same ingredients. The only reason we can conceive for this condition is that the butterfat churns easier in spring than at any other time of the year, for we very seldom have this trouble except in spring.

We do not know what to do about this and would very much appreciate some information as to the cause and prevention of this business-losing circumstance.

* * *

Homogenizer Real Solution.

Reply: I am glad to be able to say that I have had very little trouble with churning of cream. Practically all our mixes are homogenized, which has eliminated that trouble. For a short time last spring I used fresh cream and experienced some difficulty. I found that the colder the mix was before entering the freezer, the less trouble I had. Also a low brine with resultant faster freezing helped. I was also very careful to shut down the freezer when not actually freezing, as butter formed very rapidly if machine ran idle with no brine on. The real solution, I think, however, is the homogenizer.

* * *

Homogenize—Adjust Paddles on the Dash.

Reply: We have never noticed that our ice cream mix churns more easily in the spring than any other time of the year—in fact, we never have any trouble. It may be largely due to the fact that we homogenize all of our mix and it would be impossible for us to churn our mix if we wanted to. Before we homogenized our mix we had more or less trouble all the time with our cream churning, but as a rule we found that when we did have this trouble, it was due to the paddles not scraping the drum of the freezer clean, and by adjusting the paddles on the dash, we could overcome our trouble. Another reason would be that if the brine was not cool enough the cream would be whipped too long.

* * *

Freeze at Lower Temperature.

Reply: In reference to the manufacturer whose ice cream churns in the freezer more easily in the spring than any other time of the year, we are pleased to advise that we have found this true. In fact, as the result of having been in the creamery business for a good many years, we find that cream of all kinds churns and breaks a little more easily in the spring than any other time of the year. This manufacturer will, perhaps, be able to eliminate this churning tendency of his ice cream mix by cooling the mix to a lower temperature than he is at present. Cold cream or cold mix will not churn as easily as warm cream or warm mix.

* * *

Fat Churns Easier in Spring—Cool.

Reply: We wish to advise that in the spring of the year cows give much richer cream and, naturally, it churns more easily for ice cream. It also may be possible that, at other times of the year, he has the brine too warm and runs his freezer too fast. In our opinion, these are the reasons for the trouble that he is experiencing.

* * *

A Matter of Cooling and Agitation.

Reply: The matter of churning in the freezer is the same as churning in a churn. We all know that butter churns easier in the spring, when the fats are soft and the weather is warm. Later in the summer it does not churn quite so easily because the butter fats themselves change in composition, and partly because they are somewhat smaller in size, due to the advanced stage of lactation of the cows, but in any case, the difficulty can be avoided by thorough cooling of the product. If the person who has the trouble cannot homogenize in some way, he should be doubly careful to cool his cream to a temperature of at least not warmer than 40 degrees, and to cool it thus several hours before he is ready to freeze. It will enable him to freeze a better ice cream, make a smoother ice cream and more of it, and will also do all he can do to avoid churning. Of course, the best thing to avoid churning is to break up the butterfat globules with a homogenizer, but if this is not possible in his particular case, have him cool his cream very thoroughly before trying to freeze it, and then he should turn on his brine and dasher for a little while until the interior of his machine is very cool, then stop his machine, that is, stop the dasher and the flowing also and let the cream cool down. In this way the cream can be cooled to such a low point that it will be next to impossible for the butter particles to form in the cream. In other words, it is purely a matter of temperance and agitation.

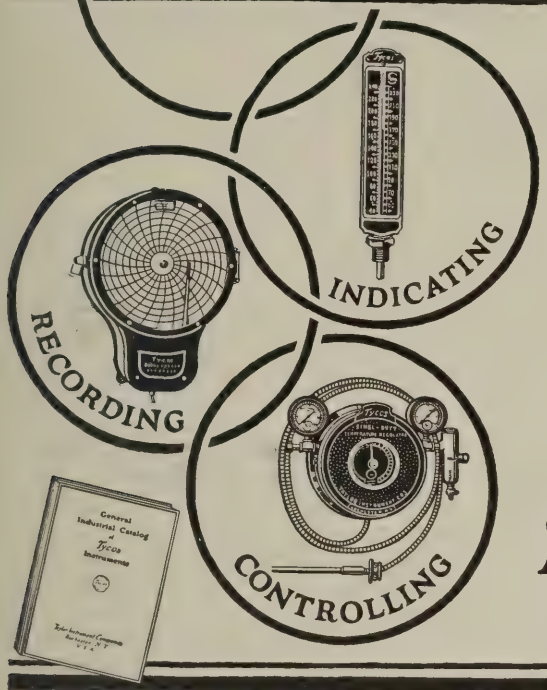
* * *

Freezer Goes Too Fast.

Reply: We have never experienced this trouble, but to make a guess, we would think the trouble was due to the temperature of the mix and the freezer operating with too much speed.

* * *

Freezing With Brine Too Warm.



Reply: We use a homogenizer so that there is almost no likelihood of the cream churning unless it should happen that the brine is very warm, and we whip it for an extended period, we have never had any trouble here at all with this. We do not believe that anyone would have trouble along this line unless they had very warm brine and whipped the mix too long in the freezer, even though their mix was not homogenized.

* * *

Cream Ripened Too Long.

Reply: The only reason I could give as a solution on this subject, especially when the trouble comes in the spring of the year, would be due to an over supply of sweet cream which would be ripened for three or four

Through Shrinkage with a
Grand Rapids
Ice Cream Cabinet

Construction of our "ZERO" Brick Cabinet

THE high degree of perfection in insulation which is attained in a Grand Rapids Ice Cream Cabinet is responsible for the maintenance of a consistently low temperature. Loss in volume of your product is therefore eliminated.

The daily shrinkage in volume caused by an inferior cabinet may be so small as to almost escape notice. But multiplied by the number of cabinets in service and then estimated for a year, the figure representing the financial loss is surprising.

Of course you are interested in stopping the small leaks that cut into your profits. We are ready to show you conclusively that our cabinets eliminate shrinkage.

ICELESS CONTAINERS HAVE PROVED TO BE A GREAT ICE SAVER.

days before freezing. I think this might possibly cause some trouble, and if such is the case, by freezing with the brine at a lower temperature would help eliminate the trouble.

* * *

Cream Warm When Placed in Freezer.

Reply: This is probably due to the fact that the weather is getting warmer and the cream is warm when placed in the freezer and churns into butter before it freezes. This difficulty would be eliminated entirely if this man would homogenize his cream before freezing it.

* * *

Mix Not Cold Enough.

Reply: We have never had the trouble that this manufacturer is having, but we think that his whole trouble is that he is not getting the mix cold enough before he puts it in the freezer. We are putting our entire mix through the emulsifier and cooling to 40 degrees and holding it there over night and are very particular about keeping it at that temperature.

* * *

Chill to 35-40 Degrees.

Reply: This cause usually arises from the mix, which is not properly chilled. We suggest the best remedy for this trouble is to chill the mix down to anywhere from 35 to 40 degrees. Another cause might arise from not having the brine the proper temperature; this will cause the freezer to churn the mix before it freezes it.

* * *

Reply: There is no material difference as to the season of the year. We have experienced that difficulty during our early stages of making ice cream, and one of the chief causes is that the mix is not properly chilled before going into the freezers, or the brine turned off before the alloted time.

* * *

Reply: Our opinion is that this man must not homogenize his mix properly before freezing, and in addition must not, and probably does not, cool his mix low enough before introducing into freezer. Also, he may have carried the temperature of the brine in the freezer too high. Any or all of these conditions would tend to cause the mix to churn before freezing. Our suggestion would be to thoroughly homogenize; next, cool as low as possible, say to not above 33 or 34, and carry the brine in the freezer not to exceed 8 degrees.

* * *

Reply: We do not know why this should happen in spring. We never have trouble of this nature because we thoroughly homogenize the mix before freezing.

Reply: There are three reasons for ice cream churning. The first reason is that by over-freezing ice cream it will butter; the second reason is that the raw material is going into the freezer too warm, and the third reason might be that his freezers are not running fast enough and the mixture must remain in the machine too long.

* * *

A Matter of Cooling and Agitation.

The matter of churning in the freezer is the same as churning in a churn. We all know that butter churns easier in the spring when the fats are soft and the weather is warm. Later in the summer it does not churn quite so easily because the butterfats themselves change in composition, and partly because they are somewhat smaller in size, due to the advanced stage of lactation of the cows, but in any case, the difficulty can be avoided by thorough cooling of the product.

If the person who has the trouble cannot homogenize in some way, he should be doubly careful to cool his cream to a temperature of at least not warmer than 40 degrees, and to cool it thus several hours before he is ready to freeze. It will enable him to freeze a better ice cream, make a smoother ice cream and more of it, and will also do all he can do to avoid churning. Of course the best thing to avoid churning is to break up the butterfat globules with a homogenizer, but if this is not possible in his particular case, have him cool his cream very, very thoroughly before trying to freeze it, and then he should turn on his brine and dasher for a little while until the interior of his machine is very cool, then stop his machine, that is stop the dasher and the flowing also and let the cream cool down. In this way the cream can be cooled to such a low point that it will be next to impossible for the butter particles to form in the cream. In other words, it is purely a matter of temperature and agitation.

* * *

Replies from State Colleges.

The trouble that this manufacturer has with the churning of ice cream during the freezing process is no doubt due to the fact that the butterfat in the spring is of a lower melting point, and being softer, churns more readily.

There are several factors which contribute to this trouble. First, the temperature at which the mix enters the freezer; second, the length of freezing time; third, the condition of the freezer.

The lower the temperature when the mix enters the freezer, the less likelihood there is of churning. With the butterfat in the spring softer than during the rest

VANILLA SECURITY

STANDARD VANILLA AND BLENDS

IF there is any one thing that counts for security in buying it is the effort that is put into the making of a product. It means something to the buyer that the product is the result of painstaking and careful manufacture, not a mere throwing together of the components, but a process correct in scientific detail, the result of laboratory research and experimenting. Add to this, an established plant with superior equipment, experienced and trained personnel, a sound business structure and you have the best safeguard against an inferior or unreliable product.

It is this that makes our products absolutely dependable.

of the year, it is necessary to have the mix at a lower temperture, the closer to the freezing point, the better.

If the freezing is carried on rapidly, there is less likelihood of churning than in a prolonged freezing.

The condition of the freezer may also contribute to this trouble. If the scrapers are dull so that the mix is squeezed rather than scraped from the sides of the freezer, there is more likelihood of churning.

Of course, as you know, homogenizing will prevent this trouble under all conditions.

DEPT. OF DAIRY HUSBANDRY,
UNIVERSITY OF WISCONSIN.

* * *

The only reason for ice cream churning in the freezer more readily in the Spring would be that the temperature was higher or that the fat globules were larger.

It is true that in the springtime the cream is more apt to be from fresh cows. The fresh cows produce milk with larger fat globules, and the larger fat globules churn easier than smaller fat globules.

If the operator will have his mix down to a temperature of 40 degrees and have his brine circulating in his freezer before the mix is added, I do not believe that he will have any trouble. It may be that he does not homogenize his mix, or possibly he has a very high percentage of fat in his mix. If he does homogenize, and does not have over 12 per cent fat, I think his trouble is due to allowing the mix to enter the freezer at too high a temperature.

DEPT. OF DAIRYING,
OHIO STATE UNIVERSITY.

* * *

There are two reasons why the ice cream mix will churn more readily during the spring of the year than at any other time. First: The butterfat is softer and every buttermaker knows from practical experience that he has to cool the cream to a much lower temperature or the butter comes too quickly. Another reason is that we usually have more fresh cows during the spring of the year than at any other time. Milk produced by fresh cows contains fat globules of a larger size and it is well known and understood that churning will be accomplished a great deal more readily the larger the fat globules. I would suggest that your subscriber cool the mix to nearly freezing point before starting to freeze it. I suppose that he has no homogenizer for if he did, he would not experience much difficulty along that line. I consider that if he will average in the neighborhood of 100 gallons of ice cream per day for five months that it would be to his advantage to install a homogenizer or viscolizer.

DEPT. OF DAIRYING,
IOWA STATE COLLEGE.

* * *

An ice cream maker should be very careful to have enough milk solids-not-fat present in his ice cream mix if he wants to prevent churning during freezing. This may be especially true in the spring time, as when the cows are turned on pasture there is a tendency to produce a softer fat which is likely to churn more easily than the fat produced when cows are on dry feed. However, I feel sure that this difficulty can be overcome if a high enough percentage of milk solids-not-fat are used when making the mix, and also if during freezing care is exercised not to have the brine too cold, because when the freezing brine is too cold, it tends to freeze the ice cream on the lining of the freezer and as the dashers come around they will tend to churn out some of the butterfat.

DEPT. OF DAIRY HUSBANDRY,
UNIVERSITY OF ILLINOIS.

I would naturally expect that ice cream would churn more easily in the spring than at any other time of year, because the fat is a little softer at this time of the year. The churning of the ice cream may be due to several causes. First, placing the ice cream mix in the freezer too warm, it should be 40 degrees or below. Second, the speed of the freezer being too fast. Third, not having sufficient freezing medium. In the case of brine freezing, having brine that is too warm, or in the case of an ice and salt freezer, not having sufficient salt in the ice or not good contact with a brine from the salt and ice and freezer. Fourth, freezing the ice cream too slowly. I trust that this gives you the information which you desire.

DEPT. OF DAIRY INDUSTRY,
NEW YORK STATE COLLEGE OF AGRICULTURE.

* * *

The only suggestion that we can make with regard to churning of ice cream in the spring of the year is that at this time they are possibly not watching the temperature of the mix and perhaps the acidity of the mix as closely as they will later in the summer. When summer time actually gets here they realize that they must use lots of brine or lots of ice to get their mix cooled sufficiently before it goes to the freezer, but in the spring they are not so careful as they are just leaving the winter season where it did not take so much effort to get the mix cold and to keep it cold.

DAIRY HUSBANDRY DEPT.,
SOUTH DAKOTA STATE COLLEGE.

* * *

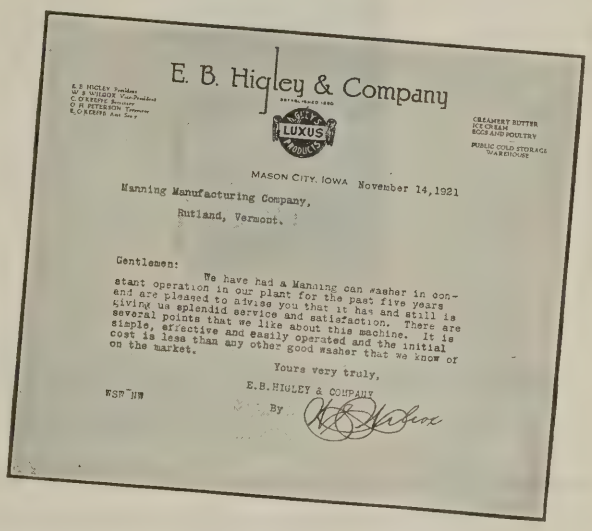
I may say this condition is due to two things. First, that the acidity in the cream is probably a little higher than it has been in the winter time. Second, the fat in the cream changes in the spring to a softer fat and consequently churns easier than in the winter. This condition can be overcome by having the cream at a lower temperature at the time of placing in the freezer. A temperature of 40 or 38 degrees would be desirable.

DEPT. OF DAIRY HUSBANRDY,
PURDUE UNIVERSITY.

* * *

There are two reasons why the small manufacturer will have trouble in the cream churning during the process of freezing at this time of the year. First, because the cream comes from cows which have recently freshened and which now have access to an abundance of blue grass pasture. These conditions have a tendency to make cream churn more easily. Second, the small manufacturer does not have the proper facilities to cool and age the cream. This means that during the first few weeks of warm weather the cream goes into the freezer at a comparatively high temperature. The agitation of the paddles causes the formation of butter granules.

We, in Nebraska, have very little trouble from this as most of the ice cream is made by the large manufacturer who is equipped with homogenizing machinery. As you know, cream which is properly homogenized can not be churned into butter. We would suggest, therefore, that you advise this manufacturer to cool his cream to 40 degrees F. before putting it into the freezer and that he freeze it with his brine at 8 degrees F. or below. We believe that this will reduce his trouble to the minimum.



DEPT. OF DAIRY HUSBANDRY,
UNIVERSITY OF NEBRASKA.

* * *

As to the cause of a partial churning of the ice cream mix, I wish to advise that several factors are in-

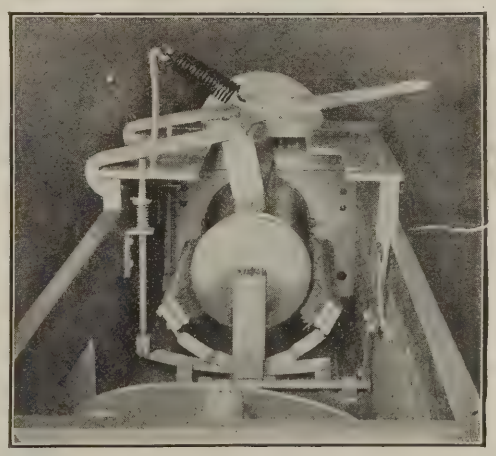
"The Initial Cost Is Less"

That's a good reason for buying a can washer, but if the quality is also "less" it's a poor investment. The Manning Can Washer named in this letter has been in "constant operation for five years and it is still giving splendid service." The Manning is first of all a machine of durability.

E. B. Higley & Company

MASON CITY, IOWA November 14, 1921

Manning Manufacturing Company,
Rutland, Vermont.



Gentlemen:

We have had a Manning can washer in constant operation in our plant for the past five years and are pleased to advise you that it has and still is giving us splendid service and satisfaction. There are several points that we like about this machine. It is simple, effective and easily operated and the initial cost is less than any other good washer that we know of on the market.

Yours very truly,
E.B. HIGLEY & COMPANY

Gifford-Wood Co.

2065 R

volved, any one of which may give the ice cream maker considerable trouble. At this season of the year the cattle are taken off of dry rations and placed on pasture. This causes a decided change in the hardness and softness of the fat globules and, as the buttermaker experiences, will cause the butter to appear very sticky and will adhere to the trier when scoring the butter. I would suggest that the ice cream maker lower his freezing temperature, investigate the speed of the dasher and cool the mix down to 40 degrees F. before placing in the freezer drum. I do not have available at this time any figures which would assist you in overcoming this defect.

COLLEGE OF AGRICULTURE,
UNIVERSITY OF MISSOURI.

* * *

This difficulty occurs at all seasons of the year where the mix is run into the freezer at too high a temperature or where the dasher runs too fast, or when the ice cream is frozen too hard. Naturally, if this happens at other seasons, it would be more likely to happen in the spring, when the butterfat is softer. You no doubt are familiar with the fact that butterfat is always softer when the cows are turned out to pasture. A method of overcoming the trouble would be to have the mix colder before it goes into the freezer, and then use care in not over-freezing. It may be that this man's mix lacks viscosity, and he freezes it for a long length of time in an attempt to obtain the desired swell. Proper aging of the mix, at a temperature around 35 degrees, will increase the viscosity and make it possible to freeze in a shorter time.

DEPT. OF DAIRY HUSBANDRY,
KANSAS STATE AGRICULTURAL COLLEGE.

* * *

There are several causes for butter particles existing in the ice cream. The greatest difficulty is encountered I believe, when emulsified cream is being used. It has been my experience that emulsified cream will churn in the freezer much more readily than will ordinary cream. The temperature of the mix as it goes into the freezer is the deciding factor, for the agitation is so great that if the temperature of the mix is above 40 degrees, and two or three minutes of whipping is allowed before the brine is turned on it is very likely to cause churning, therefore we recommend that the mix is always at least below 40 degrees before the churning and freezing process is begun.

Even though the mix may always be cooled to 40 degrees in case of freezing with a semi-continuous brine freezer where the freezer has been in operation for two or three hours, the scraping of the dull blades over the cylinder will create a greasy substance, which, after continuous operation will accumulate on the paddles and gradually will brake off and exist in the ice cream as small particles of butter. This is quite a common practice that may be remedied partially by keeping the blades thoroughly sharpened at all times so that these blades will cut all of the ice cream mix from the inside of the freezing cylinder and not rub it around, such as would happen if the blades were dull. In a case where this difficulty occurs regularly the only remedy is to stop the freezer at the end of about two hours operation and wash it thoroughly with water sufficiently warm to dissolve this fat that has accumulated on the paddle. The freezer is then cooled off and the freezing process continued.

OREGON STATE AGRICULTURAL COLLEGE.

This is probably due to the fact that the ice cream mix is usually of somewhat higher temperature at this season of the year, when run into the freezer, than during the winter months. For that reason the mix probably churns before it reaches a temperature low enough for whipping and freezing. I would suggest that the trouble could probably be overcome by cooling the mix to 40 to 35 degrees F. before running into the freezer.

THE UNIVERSITY OF MINNESOTA,
Division of Dairy Husbandry.

* * *

This would naturally be expected as the butterfat contains more fat with lower melting point and, therefore, would churn out much more easily when cows are on fresh grass than when on dry feed at other times of the year. There will be more trouble with the ice cream churning in the freezer when freezing a high fat content ice cream than when freezing a low fat content ice cream. The most satisfactory way of overcoming this is by using a homogenizer or viscolizer which would break up the fat globules small enough to prevent their churning out when freezing.

MICHIGAN AGRICULTURAL COLLEGE,
Department of Dairy Husbandry.

Nebraska Cornhuskers

Omaha, Nebr.

The Ice Cream Review:

In my trips around over the state I find that the ice cream business has been pretty slow, but this seems to be due to the cool season and the public does not seem to be spending very much on ice cream, but this is not on account of shortage of money, but just a late season.

Most ice cream men are looking for a good business just as soon as warm weather sets in.

Business of every kind is steadily improving and people are spending money a little more freely than they did a year ago and there is no reason why the ice cream man should not get his.

Of course the ice cream man is somewhat held back on account of express rates and I find some of the larger companies are thinking of putting in small plants in other than their own towns in order to save on express and this is going to make it hard on the little man as he is not in shape to compete with the larger company.

The smaller ice cream men, as a rule, are not buying very extensively just now, as I find some of them are just a little afraid of this competition and so are just buying as they need.

Eskimo Pie business has fallen off until there is very few of them made any more. I find most of the ice cream men are buying what few they need for their trade from either Omaha or Lincoln, as they use so few that it doesn't pay to bother with them.

However, in view of all that has happened in the past, if we should have a warm summer and a late fall, I look for the ice cream business to come up very rapidly.

JOE WARD.

"No great thing is created suddenly, any more than a bunch of grapes or a fig. If you tell me that you desire a fig, I answer you that there must be time. Let it first blossom, then bear fruit, then ripen."—Epictetus.

A Lengthy Discussion of Our Questionaire by an Ice Cream Manufacturer

Editor The Ice Cream Review:

Dear Sir: I certainly admire your enterprise as an editor in sending out the questionnaire in regard to ice cream. For a long time I have been more or less perplexed over the question of where editors get their inspirations. Now, however, the situation is somewhat clearer to me since receiving your questionnaire. They get someone else to do their thinking for them and take credit for it in their various publications. Please do not take offense at this statement as nothing personal is intended or implied, I offer this merely as a general statement.

It certainly would have been very kind of you to supplement that long list of questions, on which you are seeking enlightenment, and enclosed the addresses of a number of reputable and able Philadelphia lawyers to whom one could apply for assistance in approaching a reasonably intelligent amount of answers to your interrogations.

Your first question amuses me. "Do you pasteurize your mix?" Now whoever heard of making ice cream in a pasture. I was always under the impression that a pasture was a place for cattle which are the originators of basic materials that should go into the manufacture of the delectable commodity under discussion. I have had considerable experience in mixing, especially with my fellowmen, such as customers, employees, salesmen and gentlemen. I have also been mixed up in poker games, politics, singing societies and riots, but the most interesting affair I was ever mixed up in was a quartet, which certainly took the prize when it came to a question of conspiring against harmony. I never mixed much in society, because the people afflicted with this malady were always talking about tuxedos and such things. My only familiari y with tuxedo is the tobacco masquerading under that name which smokes well in pipe or cigarette. I got mixed up in my directions one night on my way home from a meeting of the Ancient Order of Hibernians. This was in the year 1916, B. P. (before prohibition), by the way when does it go into effect? I was roving about like a ship without a rudder, when one of the minions of the law who sleeps days, and sometimes nights, accosted me and inquired politely, but firmly, as to what I was doing out alone at that time of the night, or rather, morning. I tried to tell him, but he had a hard time understanding my language. He said to me: "Say, fellow, when—when you get all you want to drink why don't you call for sassaparilla?" To which I replied in my thickest English: "Shay, ossifer, when I get all I (hic) want to drink, I can't shay shassprilla." And we both laughed. It was a good thing for me that he came from the right part of Ireland or I might have been in a worse mixup than being inconvenienced by such a little thing as losing my way in the town I had been born, raised and was making ice cream in.

I can't for the life of me figure out why you should propound such a question as "What method do you use in adding gelatine?" I use the simplest method—just put it in.

To be perfectly frank with you, Mr. Editor, I don't recognize your right to question me on whether or not I use a homogenizer, viscolizer or emulsor. But your curiosity having been aroused, for some inexplainable reason or other, I might satiate your inquisitorial makeup by confessing that I do use an atomizer, 'cause I've been troubled with a sore throat from smoking those fakes labeled Havana cigars, which are in truth nothing more nor less than choice alfalfa cleverly composed and disguised in a tobacco leaf and selling at "two fer." A friend of mine handed me a cigar one day that he said was one of two for fifty. I don't doubt his veracity, but I will say that he kept the forty-five cent one. But that's neither here nor there.

In reply to your question, "What type of freezer do you use?" I will say this without fear of successful contradiction, that I use the kind that they make ice cream in. For the love of Mike, Mr. Editor, you don't suppose for a single minute (daylight saving time) that I would use a typewriter or wash machine, do you?

You know as well as I do that there is nothing elastic about an ice cream freezer and that it holds just as much on Tuesday at 9 o'clock as it does on Friday at 10.36 o'clock, so the natural conclusion is that I put in the same amount one time as I do another. What sense is there to such a question in the first place. I suppose you have a reason for asking it, but I have heard of men being shot and otherwise inconvenienced for a much less offense than this.

When I stumbled over that part of the questionnaire entitled "Freezing," I thought I would die laughing. You certainly have your dates pre ty badly mixed. You ask something about brine temperature. How in the world did you ever get pickle making tangled up with the manufacture of ice cream? Your lack of knowledge on some things is to say the least most distressing to an educated person. Paste this in your hat and refer to it frequently: Brine is used almost exclusively in pickle

A Valuable Impression

A pleasing impression upon customers is of value. You can create one and at the same time save your goods from damage by spreading sheets of **TANGLEFOOT** in your show windows, especially over Sunday.

TANGLEFOOT will then be at work for you and will not only catch the flies, but attract the attention of people who pass your store to your efforts to keep your stock clean and fresh, and create in them a desire to use **TANGLEFOOT** themselves. This means extra sales to you. For 1922 **TANGLEFOOT** has been reduced 60 cents per case. This will allow you to sell at the old price, two double sheets for 5 cents, and make a profit of 50 per cent.

Remember **TANGLEFOOT** *catches the germ as well as the fly, and that poisons, traps or powders cannot do it.*

The Gaulin Homogenizer

Is Preferred by Ice Cream Makers

Types
100 and 250 with
mounted motor

ICE cream manufacturers who take the trouble to investigate, invariably prefer the Gaulin Homogenizer. It is constructed of as excellent materials and with the same painstaking care as is the finest automobile.

This is one reason why the product homogenized is unexcelled in quality and why the machine gives good service for many years.

Write for free booklet "The Story of the Homogenizer."

foundries for the express purpose of softening the warts and making them less difficult for the consumer to sneak past the tonsils, which if rudely disturbed get sore and making things most unpleasant in the region of the esophagus or words to that effect.

I was not aware of the fact that you "pull ice cream from the freezer." According to my system I take it from the freezer with the same amount of care and precaution that I employ in removing my right shoe, which is the daytime garage for the most sensitive and whimsical corn that a man was ever endowed with.

In the matter of the amount of ice I use, I might let you in on a secret that should prove of invaluable help to you sometime when you desire to discuss, intelligently, some of the more salient points in making ice cream that can be eaten without fear of waking up with a lily in your hand. I use just enough ice to get the desired results. That may seem a trifle laconic, but it is the truth, and the truth never hurts, unless you hear something about your mother-in-law coming for a protracted visit.

I'll never forget the time I got onto a street car and sat down alongside a rather comely looking young woman. She seemed friendly enough in her actions, although she had nothing to say. That was in the days before I had permitted myself to be inveigled into pronouncing that fatal sentence on myself, "I do." I thought it would be nice if I could strike up a conversation with my seat-mate, so I blurted out: "Isn't this delightful weather we are having?" Without so much as favoring me with a glance, the young lady replied in a tone that was sopping wet with irony: "Indeed it is, but I have already discussed the subject with my husband." Say, Mr. Editor, the air in that street car was so cold that I thonght I was sitting on a chunk of ice up around the North Pole playing seven-up with a gang of Esquimox. After that freezing experience I always keep still when talking to strange ladies on street cars or any other place for that matter.

Well, I wouldn't lay any big wagers that you are going to get very much help out of my answers to your questionnaire, but I will lay a small bet that it is going to take some of the conceit out of you, since you very apparently have become imbued with the thought that the legal firmament lost a very brilliant representative when you turned into a sanctum sanctorum and decided to wield a trenchant and dripping pen for the edification and education and elucidation of the ice cream makers of the country and city.

But before I complete my part of the work, I just want to answer one or two more of your questions. This one in particular: "How long does it take to properly harden your ice cream?" You should know,

Audel's
"Answers on Refrigeration"

A practical treatise for engineers. This book is the most complete work on the subject of refrigeration and ice making on the market today. 690 pages. Half leather binding.

if you don't, that it takes only long enough to get rid of the softness that seems to be one of the original faults with the stuff.

Yes, I most certainly do prefer a Still Hardening room, because while it is still hardening there is no danger of ice cream becoming soft, a condition that is very difficult to overcome if the proper methods are not used. You will have to think this one out for yourself.

In summing up I desire to offer this suggestion. There are some ice cream makers in this country who if they really want to enjoy the highest public esteem and "repeat" business, built upon honest goods they ought to try and put some whole milk, just as it comes from the cow—without subtraction, addition or multiplication—into the product they are turning out and quit fooling the unsuspecting taxpayers and other inhabitants of this mundane sphere with some combination that in truth is anything but that. I for one here and now, solemnly pledge myself to try it out once and see what happens.

Very truly yours,
I. M. THROO.

⚜

A FAR-SIGHTED ORGANIZATION.

Realizing the need of diversified farming instead of one-crop farming, in order to beat the boll weevil, and realizing that the dairy cow is the center of diversified farming, the recently organized Sumter Creamery is doing a real service to its community by encouraging purchases of dairy cows. This creamery is buying good dairy cows and placing them among its patrons, and when a patron has not enough ready money to pay for the cow, they let the cow pay for herself in milk delivered. L. D. Jennings, president of the firm, has "started the ball rolling" by purchasing four registered Guernseys from a prize winning herd, and he expects to further augment his herd by purchasing from 50 to 100 more Guernseys. Mr. C. W. Schmolke, general manager of the Sumter Creamery, states that there are many fine positions and partnerships open in that vicinity for young men who have a knowledge of dairy husbandry and a little money to invest.

⚜

DE KALB ICE CREAM COMPANY ABSORBS CRYSTAL ICE COMPANY.

The DeKalb Ice Cream Company, Auburn, Ind., lately incorporated for $32,000, recently began operations. The organization has taken over the old Crystal Ice Company, and added an ice cream making department. All kinds of ice cream will be sold as well as artificial ice. The ice cream will be sold under the trade name of "Just-rite." The firm occupies a new 30x50 reinforced concrete building which is, according to neighboring ice cream men, one of the most modern, up-to-date ice cream plants in the state.

The officers of the corporation are: B. O. Fink, president; C. B. Proseus, vice-president; H. H. Fitch, secretary; C. E. Kingsbury, treasurer and general manager.

The Ice Cream Review:

Conditions in the ice cream industry are very bright. Our friends are looking for an unusually good season dependent somewhat, of course, upon the number of warm days that the summer may bring.

Ice cream is gradually getting to a point where it is no longer a seasonable dish, but naturally the peak load comes during the summer and a short rainy or cold spell is a decided loss and cannot be made up.

We find that most of the factories in Wisconsin are equipped with modern machinery and are kept in a clean and sanitary manner.

We see no reason for being pessimistic regarding the future. The ice cream industry is on a firm basis and cannot be legislated out of business. The only thing that might hurt the industry would be the establishment of too many small factories. While the consumption of ice cream has been increasing steadily per capita, nevertheless there will be a point beyond which the establishment of new factories will not increase the consumption, but will lessen the profit of the legitimate manufacturer and which may cause him to cut the quality of his goods in order to stay in business.

This certainly would be deplorable, as in our opinion it is the quality that sells the ice cream.

J. G. HAMMERSCHLAG.

* * *

Minneapolis, Minnesota.

In the northwestern part of the state all manufacturers say that their make is up to last year's; some say no gain so far, and some say a gain of about 10 per cent. All of them feel that they have a good season ahead but on account of the late spring, they do not expect much of a gain over last year. No new plants of any size are going in this year.

M. E. THOMPSON.

* * *

Waukesha, Wisconsin.

Gentlemen:—Your letter of recent date received regarding conditions in the ice cream industry. I find the Shurtleff Ice Cream Co., of Janesville, Wis., are enjoying an excellent trade and have added some new equipment, including a No. 40 De Laval. President Touton always on top.

The Cronin Dairy and Ice Cream Company, Janesville, are also enjoying a fine trade.

The Kellogg Ice Cream Co., Burlington, Wis., has made some improvements and built a fine addition to their plant. Trade is good and improving.

The Sturtevant, Wright & Wagner Dairy Company, Beloit, Wis., are believers in quality ice cream and trade is getting better.

The Waukesha Ice Cream Co., Waukesha, Wis., are steadily growing. They have purchased two additional delivery trucks and engaged an assistant ice cream maker; their future is bright.

The Hurtgen Dairy Co., Oconomowoc, Wis., are manufacturing excellent ice cream and enjoying a fine trade which is still improving. They are moving into their new $50,000 plant.

Storcks Ice Cream Co., Slinger, Wis., are kept in full swing; trade is opening up with an excellent future.

The Racine Pure Milk Co., under the management of M. C. Nelson, is kept very busy and trade is gaining. When in Racine ask for it—of course they use a De Laval. Oh, yes; Billy's Ice Cream Co. is also enjoying excellent trade, and it is getting better each week.

The writer believes the demand is increasing and the manufacturers are striving to put the very best ice cream on the market.

J. R. WILLIAMS,
The De Laval Separator Company.

* * *

SOME STATES CAN BOAST.

Wisconsin makes over 60% of the cheese made in the United States.

Minnesota makes 40,000,000 pounds more creamery butter than any other state in the Union.

Wisconsin has the most dairy cows, 2,683,000.

Wisconsin has the greatest number of silos in use, 82,375. New York next with 50,842.

Minnesota exports 77% of its creamery butter.

Nebraska second with 74%.

Iowa third with 73%.

SUNG BY THE EASTERN BUNCH AT NATIONAL CONVENTION.

Tune: "Long, Long Trail a Winding."

We were very sad and lonely way back in the East,
Our thoughts were of you only and this wonderful feast.
How our hearts yearned to be with you as in the days gone by,
So we borrowed the cash and here we are, but the trip made us so dry.

"It was a long, long trail we journeyed to be with you today,
Our hearts are filled with gladness that we came out your way.
You have fulfilled all your promises as to the good time we would have,
Here's our hats off to the Western folks, they are the best God made."

This ice cream year has been very dreary since July has gone,
August brought us many chills and nearly put us all in pawn.
But the ice cream folks are optimistic going on without fear
For is they don't cash in this season, they will get their's another year.

So on the long, long trail we will journey as we have journeyed in the past.
Doing good to one another is our motto that will last.
We're all one great big family and no matter where we roam
Our thoughts will be with our Western friends long after we reach home.

NEW DIPPING MACHINE ON MARKET.

The Frozit Manufacturing Company, of Columbus, Ohio, have placed on the market a new machine for dipping chocolate coated ice cream bars which appears to be a very simple and efficient outfit. Only two girls are needed to operate it, one at the feed end and one to remove the dipped bars from the hooks. The travel from the chocolate bath to the take-off and is long enough so that when the pieces reach the second operator they are dry enough for wrapping. It is claimed that this machine will give perfect results with no waste in time or material. Its normal capacity is 25,000 pies or cakes in a day, and by making a simple adjustment the machine can be speeded up to a daily production in excess of 30,000 pies.

The Ice Cream Review:

Answering your recent letter relative to trade conditions in the Northwest beg to advise that we feel very optimistic over prospects for the coming season throughout the entire Northwest.

The ice cream business in general has been somewhat retarded during April and May due to the extremely cold and rainy weather which prevailed during the better part of these two months throughout the Northwest. However, most of the manufacturers report an increase in May of this year over the same period of last year. The recent increase in the price of farm products has helped the shipping business to the country trade very materially and all of the manufacturers are expecting good business through the summer months and have been preparing or are preparing to take care of the three months' rush of June, July and August by installing additional pasteurizing and aging equipment, also freezing and storage capacity which shows more than anything else that conditions have taken an upward trend and everyone is feeling more optimistic.

All manufacturers both large and small are evincing a greater interest than ever before in modern equipment such as glass lined combined mixers and pasteurizers as well as vats for other purposes. Practically all of the Twin City plants are now completely equipped with Elyria Tanks which is a further indication that all are expecting conditions to continue to improve.

Our sales are normal and prospects for future business look even better than normal. A large number of the manufacturers are installing new machinery at present and quite a number throughout the Northwest have purchased new machinery to go into new plants which will be put in operation even during the midseason, which is a still better indication of the optimistic attitude of the trade in general.

We certainly wish to compliment the Ice Cream Review on its interest in the welfare of the ice cream business as well as the manufacturers who cater particularly to the ice cream trade. We look forward each month to the coming of our "Review" as each issue seems to be even better than the last one and certainly contains a vast amount of interesting as well as useful information not alone for the manufacturer of ice cream but also for the supply manufacturers. You are putting out a wonderful trade magazine and we certainly hope you will continue the good work.

Trusting the above gives you the desired information as to trade conditions in the Northwest, we beg to remain.

D. M. WEBSTER.

* * *

Waterloo, Ia.

The writer calls regularly upon the Northeastern Iowa ice cream manufacturers and if there is a single one with pessimistic ideas, I believe I would know it. With favorable ice cream weather, they anticipate a very good year. Altogether, it might be stated that they are a very much alive class of manufacturers and would be successful anywhere in any line of business.

H. W. WALKER,

Charlottesville, Va.,

NOTICE!

THIS is one of the many ice cream manufacturers who lets "the picture tell the story."

You, too, should let the picture convey the fact that you sell ice cream.

See the other side for details.

TEMPTING pictures will create more desire for your product than mere words or any arrangement of type!

The picture tells the story. It conveys your business to the reader at a glance. Its attractiveness commands attention and the thorough reading of your letter which you strive for. It creates desire for your product, and makes the reader "sit up and take notice".

You can have this idea incorporated into ***your*** letterhead.—printed in four colors with your firm name and wording along the line of this sample and on the same grade of stock at prices that will interest you.

Only one ice cream manufacturer in each city can secure the use of this distinctive design. You may need a supply before long. Here is your opportunity for something different.

Write for prices.

THE OLSEN PUBLISHING CO.
MILWAUKEE, WISCONSIN

PROF. BAER'S INQUIRY DEPARTMENT

Dear Sir:—Please give me a formula for a 10% butterfat ice cream. I want to use the following: 6% sweet milk, sweet butter, sugar, gelatine and vanilla, 1 lb. of Purity Powders to 100 lbs. of mix. I would like to have this formula for a 100 lb. mix. L. E. P.

Reply: I am glad to refer you to Table No. 1 below, where I have figured out such a mix as you describe for you:

Table No. 1.

Ingredients	Fat	Serum Sol.	Total Sol.
14.0 lbs. sugar	.....	.....	13.30
.3 lbs. gelatine	.....	.....	.27
1.0 lbs. Purity powder	.....	.....	.95
6.3 lbs. 84% butter.....	5.29	.....	5.29
78.4 lbs. 6% milk	4.70	6.56	11.26
100.0 lbs.	9.99	6.56	31.07

You will notice that with the ingredients in your mix you have only 6.5% serum solids and the total solids are also low. You could easily increase the total milk solids so as to make them about 20%. Most of the commercial factories use 20% total milk solids making up the deficiency in serum solids by using skimmilk powder of condensed milk.

* * *

Dear Sir:—I would thank you very much for a good formula for an ice cream mix to be made with cream and not with powdered or condensed milk. M. N.

Reply: I am suggesting below, in Table No. 1, how you could make ice cream, using milk and cream only:

Table No. 1.

100 lb. mix, 14% fat, for 20 gallon mix.

Ingredients	Fat	Serum Sol.	Total Sol.
14.0 lbs. sugar	.....	.....	13.30
.5 lbs. gelatine	.....	.....	.47
85.5 lbs. milk and cream....	14.00	6.36	20.36
Vanilla to flavor.			
100.0 lbs.	14.00	6.36	34.13

Suggestion 85.5

44.0 lbs. 30% cream	12.3 lbs. fat.
44.5 lbs. 4% milk	1.78 lbs. fat.
85.5 lbs.	14.08 lbs.

In order to get sufficient milk solids, namely, 20%, it would be necessary to make the mix test about 14% butterfat. You understand that the percent of cream would vary from day to day and 85.5 lbs. suggested in the table would have to be calculated each day.

* * *

Dear Sir:—We do not pasteurize but simply use raw sweet cream for making our ice cream.

We use 44 lbs. raw sweet cream reduced with skim milk to test 20 per cent butterfat, 7 lbs. cane sugar, 2 oz. vegetable gum mixed thoroughly with sugar, then stir into cream, 2 oz. gelatine with a little water dissolved and stir into batch. Let this age for three hours, add three ounces of vanilla, then freeze. This batch will make ten gallons of ice cream. With this formula we generally mix up one batch consisting of from fifty to seventy-five gallons of ice cream.

If this is not the correct way kindly give us a new formula, stating just what to use, whether or not to use gelatine alone and how to use it. What temperature

Speed Up
Your Brick Cutting Dept. with a "New Era"

The New Era Company
146 Merritt St. Oshkosh, Wis.

should the gelatine be brought to when dissolved, and also when stirred into the batch?

So far we have had no trouble with our cream, except in the spring of the year when the wild onions come up the cream tastes of the onions. Is there any way to overcome this without pasteurizing or any other machinery excepting the freezer? M. C. Co.

Reply: I have analyzed your formula below, in Table No 1:

Table No. 1.

Ingredients	Fat	Serum Sol.	Total Sol.
44.0 lbs. 20% cream	8.8	3.13	11.93
7.0 lbs. sugar	.....	.....	6.65
.25 lbs. gum and gelatine...	.....	.....	.24
51.25 lbs.	8.8	3.13	18.72
Per cent 17.1		6.2	37.2

You will note that you have an extremely rich ice cream, testing 17% butterfat. You have, undoubtedly, been reading over some of the formulas in The Ice Cream Review and have noted that most of the condensed skim milk, butter and condensed milk was used for the purpose of increasing the milk solids not fat where the butterfat content was about 10%. Your formula has a total milk solids content of 23% and you should have, of course, a good quality of ice cream but in my opinion it contains too much butterfat.

If you will let me know what percent butterfat you desire in your ice cream and what you have to work with I shall be glad to figure out a more satisfactory formula for you.

Relative to the use of both gum and gelatine in ice cream, I see no reason why you should not continue to use both although it appears to me that two ounces of gum used along with two ounces of gelatine is too large a proportion of gum. I would sooner use one ounce of gum and five ounces of gelatine. After dissolving the gelatine in a little water the temperature would have to be brought up to about 160 degrees in order to have it stirred through the rest of the batch, especially if this batch was cold.

Relative to the matter of the wild onion flavor which we have in the spring of the year, our experience has been that we can get rid of this flavor somewhat by pasteurizing and aerating. When milk or cream is at a hight temperature the wild onion flavor will disappear. I believe you would have less trouble from the wild onion flavor if you would pasteurize your mix instead of using it raw. Many states now require the pasteurization of an ice cream mix. In my opinion no ice cream should me made from a raw milk, especially where the milk is supplied from farmers in the community. Ice cream cannot be an ideally safe product without pasteurization due to diseases caused by germs which are apt to be in the milk or cream.

* * *

Dear Sir:—We received the analysis of our ice cream mix and tried the one that you gave us. We wish to change our formula in our ice cream mix to sweet cream 30% sweeten-condensed skimmed, 4% milk, sugar gelatine, water, milk powder.

Please give us a formula testing 10% butterfat, 14% sugar and 36% total solids, it would be very much appreciated by us. We make a 100 gallon mix at one time.

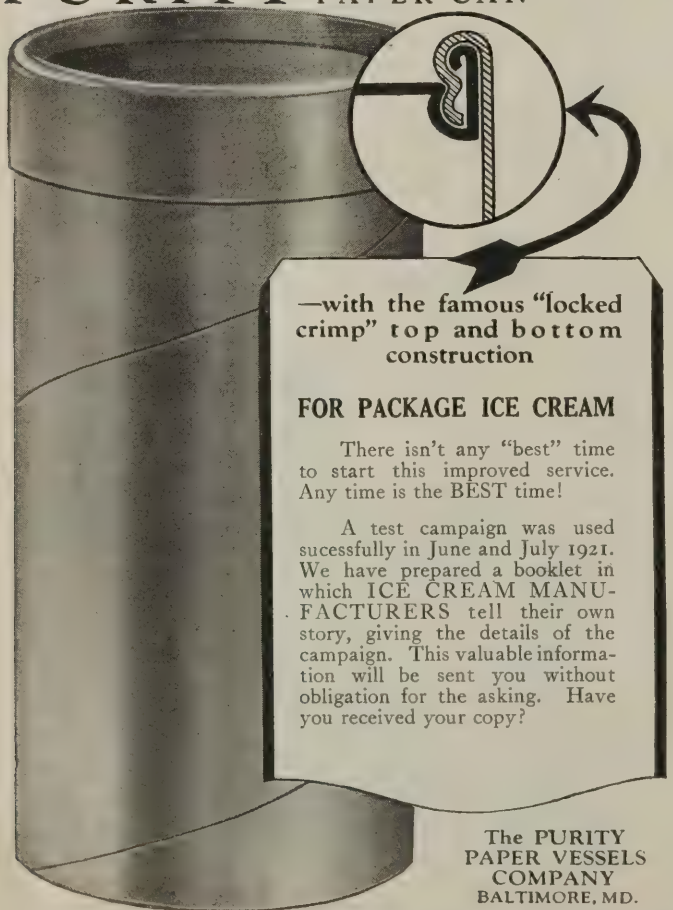
R. I. C. CO.

Reply: You stated that you made a 100-gallon mix at one time. I presume that you mean sufficient mix to make 100 gallons of ice cream. This would be a mix totaling 500 pounds, allowing 5 pounds to a gallon of ice cream and I am suggesting below, in Table No. 1, how you could make up such a mix with the ingredients which you stated in your letter:

Table No. 1.

500 lbs. mix, 10% fat, 14% sugar, 36% T. S.

Ingredients	Fat	Serum Sol.	Total Sol.
38.0 lbs sugar	.....	.....	36.10
2.5 lbs. gelatine	.....	.....	2.37
80.0 lbs. sweet condensed ...	.....	21.60	53.60
135.0 lbs. 30% cream	40.50	8.46	48.96
242.5 lbs. 4% milk	9.70	20.69	30.39
2.0 lbs. skimmilk powder ..	.....	1.90	1.90
500.0 lbs.	50.2	52.65	173.32
Per cent 10.04		10.53	36.6



You could, of course, modify this formula by using less than 80 pounds of sweet condensed milk and making up the solids by using more skimmilk powder. Should you desire to do this and not see your way clear to figure it out I shall be very glad to assist you farther.

* * *

Dear Sir:—I wrote you several times for advice in regard to my work in an ice cream plant. I feel myself under a great obligation to you for the help you have given me but I find it necessary once in a while to ask some authority about difficulties which come up in my work.

We are using a mix made up of whole milk, skim powder, sweet butter, sugar, gelatine and flavor. We have milk none of which is over one day old and the other ingredients are all as good as can be bought for ice cream. We viscolize at from 2,500 to 3,500 pounds, pasteurize to 145 degrees and hold for twenty minutes, cool to 130 degrees before viscolizing. Our trouble is that we cannot geth the same results from the viscolizer on each mix. One will come over the cooler thick, vis-

There isn't any "best" time to start this improved service. Any time is the BEST time!

A test campaign was used sucessfully in June and July 1921. We have prepared a booklet in which ICE CREAM MANUFACTURERS tell their own story, giving the details of the campaign. This valuable information will be sent you without obligation for the asking. Have you received your copy?

The PURITY PAPER VESSELS COMPANY BALTIMORE, MD.

Ice Cream as it was before Washington was President

ALMOST interesting recipe, this, for it is one of the earliest ice cream formulas known, having been made up by Sieur Gilliers in 1768. It is really the begining of what is now a great American industry. Tortoni, Conteau and other ice cream makers of that day have left us a heritage because their product was always good.

The modern manufacturer will safeguard his reputation and business by taking that leaf out of Tortoni's book. And the surest way to be satisfied as to the quality of the milk solids you use in your ice cream is to depend on

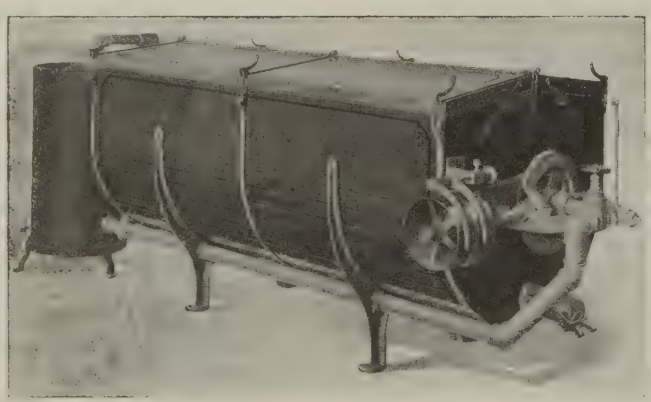
Dependability!

Careful selection of raw materials, expert supervision and frequent, careful testing during manufacture gives the Manning Batch Mixer a factor of safety never before built into a similar piece of ice cream apparatus.



Every coil is tested to 300 pounds hydrostatic pressure. Every machine, upon completion is set up and operated under actual working conditions for two hours.

No faults can escape this minute inspection.

MANNING EQUIPMENT

MANNING MANUFACTURING COMPANY

Rutland, Vermont U. S. A.

The First Cost,— Low as it is,— Is Practically the Last!

cous and as smooth as could be asked for and the next batch will be thin and run, of course, at the same pressure. The valves on the viscolizer have been ground and the machine seems to be in good shape. Please give us any advice you can and any criticism you may find of our methods. D. H. B.

Reply: I cannot see why the viscolizer should be responsible for the difficulties in your mix. The trouble, undoubtedly, is caused by aeration in the physical condition of your mix before viscolizing. This could quite naturally vary from day to day.

It is possoble that your whole milk is the cause of your trouble rather than the viscolizer. I suggest that you work on your whole milk, testing it for acidity from day to day, and also paying particular attention to the pasteurizing temperature of the mix and also to the temperature at which the mix passes through the viscolizer.

* * *

Dear Sir:—We make two grades of ice cream. Our ambition is to make our best grade as pure, smooth and palatable as it is possible to manufacture ice cream, regardless of cost, and would like to have your opinion of ingredients to be used, proportions of same, amount of over-run and process of manufacture.

The materials at our disposal are pasteurized separated cream, testing 40 to 44%, pasteurized milk, condensed skim milk containing 30% solids, cane and beet sugar, maltose and corn syrup, eggs, gelatine, gum and improvers, and pure flavors.

Our equipment consists of a 300 gallon capacity pasteurizer with a working capacity of 2,500 to 2,800 lbs. of mix. The pasteurizers can be heated to 180 degrees. We have storage vats of sufficient capacity to age mix seventy-two hours, steam kettle capacity 100 gals., viscolizer, Mojonnier over-run tester, brine freezers. Brine temperature runs from 0 to 10 degrees above zero, and can standardize it at any degree in between. Storage rooms carry temperature of 5 degrees below zero to 10 above, still air system, climatic temperature ranging from 50 to 70 degrees in the winter and 65 to 80 degrees in the summer.

We want an ice cream that will hold up in our storage rooms for ten days, no limit as to cost, but want quality product.

Would also like to have your opinion of what effect the change of temperature from ten degrees below to ten degrees above and back to ten degrees below have on ice cream. P. M. D. CO.

Reply: I am suggesting below, in Table No. 1, the ingredients for a 100 pound mix which ought surely to make a very satisfactory product for you.

Table No. 1.

100 lb. mix, 20 to 21 gallons of ice cream.

Ingredients	Fat	Serum Sol.	Total Sol.
14.0 lbs. sugar			13.30
.5 lbs. gelatine			.475
10.0 lbs. condensed skimmilk		3.00	3.00
31.0 lbs. 40% cream	12.40	1.67	14.07
44.5 lbs. 4% milk	1.78	3.78	5.56
100.0 lbs.	14.18	8.45	36.40

Of the ingredients which you mentioned you had available the cane sugar is much preferable to beet sugar and is, of course, much cheaper as a sweetener at this time. Personally, I prefer the use of a good grade of gelatine for the filler. If you want to use some eggs, of course, you might do so for certain trade which desires that ingredient. In the commercial manufacture of ice cream, however, eggs are never used.

In processing the ice cream mix it is not necessary

Chocolate Coated Ice Cream and Tin Foil

THEY started out together and have developed into a strong team. The tin foil protects the chocolate coating and keeps the ice cream center firm and cold.

A Conley Foil wrapper, attractively printed in one or two colors, will keep your chocolate covered ice cream bar or Eskimo Pie selling at a lively clip this summer.

It will pay you to get in touch with us at once.

541 West 25th Street ~ New York City

or advisable to heat above 145 degrees. The mix should be held, however, at that temperature for about thirty minutes and then cooled to 120 degrees and passed through the viscolizer, thence over the cooler and into the storage vats.

It is not necessary to age a mix over 24 to 48 hours. After that a temperature of 40 to 45 degrees is sufficient to get the proper smoothness and over-run.

In storing ice cream in a cold storage it is always advisable to maintain a uniform temperature if possible. While 10 degrees above zero would not soften the ice cream, repeated changes of temperature from 10 degrees above zero would not soften the ice cream, repeated changes of temperature from 10 degrees below to 10 degrees above would tend to have some effect on the body and smoothness of cream after held in cold storage five days or longer.

* * *

Dear Sir:—I notice in your formulas in The Ice Cream Review you allow 60 lbs. of sugar to 100 gallons mix. I have been using 100 lbs. of sugar to 100 gallons mix, or one pound to every gallon. Kindly let me know if I am right or wrong. P. A. M.

Reply: I have your letter of recent date referring to a formula which you found in The Ice Cream Review, where 60 lbs. of sugar was used to a 100 gallon mix, meaning by a 100 gallon mix sufficient mix to make 100 gallons of ice cream. Figuring the weight of ice cream at 5 lbs. to a gallon this ice cream would be made from 500 pounds of mix. Allowing 12% sugar, or 12 pounds of sugar to 100 pounds of mix would total 60 pounds of sugar.

If you are using 100 pounds of sugar for 500 pounds of mix you are using 20% sugar which would make a product entirely too sweet. Some of our factories are

B-K Bacili-Kl Trade-Mark

Universal Purifier For the Dairy Industry

B-K has been accepted by the Dairy Industry as the Standard Sterilizing Agent. From farm to factory it is used to prevent bacteria from causing inferior dairy products. Farmers, manufactures, inspectors, physicians, health boards, and dairy schools agree that B-K fills an important need in the problem of maintaining greater purity of dairy products.

Such universal acknowledgment of the value of B-K can only be the result of exceptional merit backed by intelligent cooperation from our Laboratories.

It is our business and our pleasure to help you to better products and more profits.

Ask for Bulletin No. 320, telling How B-K is used to improve quality.

using 14% sugar which would, in this case, be 70 pounds for the 500 pounds of mix.

* * *

Dear Sir: I have enclosed a schedule showing the ice cream mix I am using in manufacturing my ice cream. The ice cream manufactured in accordance with this ice cream mix does not seem to be satisfactory, and I am not able to get 100% overrun. The best I am able to get is 85 to 87% overrun.

I would appreciate your careful analysis of this mix and advise me just what the irregularities may be, as I want to make the best ice cream possible and also to get at least 100% overrun.

I am willing to make any change, or changes necessary in order to improve my ice cream, and I would also appreciate you sending me a table covering what you believe to be the best mix.

I have analyzed your ice cream mix and you will find the details given below in Table No. 1:

Table No, 1.

Ingredients	Fat	Ser. Sol.	Tot. Sol.
150.0 lb. 84% Butter	126.00	.....	126.00
431.0 lb. 4% Milk	17.24	36.85	54.09
100.0 lb. Sugar	.....	.....	95.00
60.0 lb. Skimmilk Powder	.....	57.00	57.00
110.0 lb. Sweet Condensed	.....	29.70	73.70
7.0 lb. Gelatine	.....	.....	6.65
5.0 lb. Vanilla	.....	.....	.75
250.0 lb. Water	.....	.....	.....
1113.0 lb.	143.24	123.55	413.19
Per cent	12.8%	11.1%	37.1%
Per cent sugar	12.9%		

You stated in your letter that you had trouble in getting a satisfactory over-run and that also your ice cream was not just what you thought it should be. It is possible that you could increase your over-run by reducing the serum solids a little bit. It would really not be necessary to use over 8% serum solids with a butter fat content of nearly 18% as you have. Twenty to 21% total milk solids would be sufficient for a good ice cream.

You did not state in your letter just what you thought was the matter with your ice cream mix which resulted in an unsatisfactory ice cream, whether the difficulty was in flavors, or texture of your product. I suggest that you write to me again giving me all the details of handling your ice cream mix, pasteurizing, and any processes you do, length of time you age it, the temperature of your hardening rooms and any other information which will enable me to locate your trouble.

* * *

Dear Sir: The following is our method of making ice cream. We would ask for analysis as to solids, etc., and suggestions for improvements.

Our pasteurizer holds about 50 gal. We use: 30 gal. 20% cream; 8 gal. 8% condensed (unsweetened); 5 gal. 4% whole milk; 50 lb. sugar; 2 lb. gelatine; 20 oz. vanilla powder; 14 oz. meloine.

The first four items are put in pasteurizer first and gelatine (dissolved in gallon of water) and vanilla added just as we are ready to draw off, thus mix runs through emulsifier and then over the cooling coils. When put in cans meloine is added, and let mix set in cool room from 24 to 48 hours to ripen.

We have had no trouble, unless it is that some of our stores claim they can not keep the cream hard enough.

We keep our cold room between 2 and 8 above zero and cream does not get as hard as it seems it should. Wish you would write me giving analysis and sugges-

tions for improvement of mix and also mix that would run about from 12 to 14 per cent butterfat. W. H. S.

Reply: You will find this analysis given below in Table No. 1.

Ingredients	Fat	Serum Sol.	Tot. Sol.
30 gal. or 249.0 lbs. 20% cream..	49.80	17.80	67.60
8 gal. or 72.0 lbs. 8% condensed	5.76	12.96	18.72
5 gal. or 43.0 lbs. 4% milk....	1.72	3.65	5.37
50.0 lbs. sugar.....	.....	.....	47.50
2.0 lbs. gelatine.....	.....	.....	1.90
8.3 lbs. water.....	.....	.....	.....
2.0 lbs. vanilla and Meloine	.....	.....	1.50
425.3 lbs.	57.28	34.41	142.59
Per cents	13.44	8.079	33.4
Per cent sugar.....	11.7		

You suggest further that you want a mix testing between 12 and 14% butterfat. Your present mix is according to this statement just about what you want and I am, therefore, not suggesting another one. I am sure that you should have no trouble in securing a very satisfactory quality of ice cream from your present mix. You will notice, however, that the sugar content of your ice cream mix is somewhat low. Most of our factories are using about 13% sugar. I would also say that I could improve your mix somewhat by using a little more milk serum solids. This could be done by using a little more condensed milk or by using skimmilk powder.

You stated further that you kept your hardening room from 2 degrees to 8 degrees above zero and that the cream did not get as hard as it should at that temperature. You should have your hardeneing room from 0 to 10 degrees below zero as the temperature you are using is hardly low enough to harden your cream as it should and also harden it in a short enough period of time.

California and Southwestern States Ice Cream Mfrs' Ass'n

Proceedings of Seventh Annual Convention, Held in Stockton, California

(Continued from May issue)

SECOND SESSION—December 6, 1921.

The President: If my watch is correct we are a few minutes behind time this morning—only an hour and twenty-five minutes. We were supposed to have started at 9:00. It is now 10:25.

We have a pretty full program this morning, and there are several talks on the program. We were unfortunate on having several numbers come up minus on yesterday's program. For this forenoon we will have a full program and some very interesting numbers. There is nothing of a miscellaneous nature to take up and we will go right on with the program. The first number is Mr. Walker, and the subject is:

ASSOCIATION STABILIZERS.

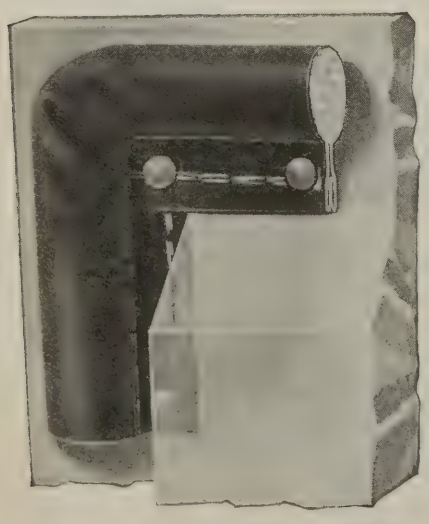
Address by Bert H. Walker, Secretary Pacific States Ice Cream Manufacturers' Association.

Mr. Walker: Unfortunately our past president could not get down here. He is our orator and I had to have this down on paper. I could not get away with it any other way.

When I received a wire from your secretary requesting me to come down and say a few words to the members of the California and Southwestern Association, it reminded me of the story of the man who asked a stuttering newsboy where the Union Depot was. After trying for some time to get the words out the kid said "H-h-hell, there are 100,000 people in this city and you had to pick on me." I might be able to think of what I wanted to say after it was all over, but when I get on my feet I feel like the glassware in Doc Capron's room—absolutely empty.

After getting here and meeting so many pleasant people I feel there is a lot of truth in a tale that has been told all over the country by Wynn Morris, when he is called on to speak. A farmer and his wife were entertaining a few of their friends one evening. The men talked over the usual topics of interest, such as getting more for butterfat, etc.—you all know the line—this continued well along into the evening when the host went to the pantry and got a pitcher, of which his wife was very proud, and started for the cellar for some cider. In some way he tripped on the stairs and rolled to the bottom. His wife, quite alarmed, went to the door and called to him, "Josiah, you didn't break my pitcher, did you?" to which he replied, "No, but by gad I will."

Association and Organization are two great factors in everything that goes to make up the business and social world, from the U. S. government to the Potato Peelers Union, and when properly conducted are wonderful influences in obtaining the benefits sought by the individual association. In order to get anywhere you must have co-operation. This must come through constructive leadership. You must have some man in the community who will take the load and carry it through, and he is the fellow who is going to have his troubles, too, but in the end the satisfaction of what has been accomplished will be worth all the effort it has cost.



Association Stabilizers, the topic assigned to me, are quite numerous, so I will not attempt to classify them, nor yet to cover them all, but will touch lightly on a few of what we have found most important in building up an association to where it functions for the best interests of its members.

Every trade association that has ever been organized has had to run the gamut of criticism from within its industry; from the Hawkshaw eye of politicians in office who feel they must make secure their hold upon their particular job; and by unthinking persons outside who invariably attribute the worst motives to business competitors who meet together for the improvement of their industry.

The legitimate trade association organized openly and above board, with constitution and by-laws, has been a decidedly helpful factor to the various lines of industry. The one which is harmful is one which has no such safeguards and which governs itself by so-called gentlemen's agreement. These associations result in suspicion being cast upon the legitimate ones.

It is due to associations that so many of the objectionable trade abuses have been abolished and in place of antagonistic feeling existing among some of the trade a friendly spirit and desire to meet and talk over their various problems is the safe and sane course followed.

I might use as an illustration of loyalty, the story of a kindly old Jewish merchant who was taken to the hospital with the small-pox. He was a very sick man and felt he was surely going to die, although the attendants tried to assure him to the contrary. As he persisted in the idea they asked him if they could do anything for

GELATINE IS USED IN ICE CREAM—

(1) As a smoother.
(2) As a stabilizer
(3) To prevent crystallization.
(4) To aid digestion
(5) To increase food value

It is a scientific fact supported by innumerable scientific men, that nothing else on earth has equal value, used as a substitute for good gelatine in Ice Cream.

REMEMBER—The argument that low grade gelatines are just as good as the highest grades is foolish. YOU know it. Use DELFT top quality grades, save money and gain satisfaction.

ASSOCIATION OF ICE CREAM POWDER MEN MEMBER

Harold A. Sinclair

him, to which he replied that he would like to see a priest. They thought this a strange request, and said, "Mr. Cohen, you are a Jew, are you not?" "Why certainly I am." "Well, it seems to us you would rather see a Rabbi." "Father Abraham!" replied the old man, "should I give the Rabbi such a disease?" You see he was loyal and wished to afford his friends all the protection possible.

There are many problems in association work that require tact which is a stabilizer. You are going to discus your problems and I have no doubt you will do so with an open mind, but right there is where one of our troubles comes in. We are not always ready to approach the problems of our own industry free from prejudice.

In Seattle we have a little informal association where the local members meet each week for lunch and thrash out some of their troubles. This is not confined to Seattle, but takes in neighboring cities. This is a means of getting better acquainted and we get at each other's problems. We have committees appointed to take up the work and it brings the men closer together. Still, outside of following general rules, I am a firm believer in the fact that every manufacturer has his own problems to work out, and in his own way, but we can at least adhere to a scheme of dealing fairly with our competitor.

We must respect the other fellow's opinion, too. He is as apt to be right as we are. We must remember there are three sides to a question—your side, my side and the right side. Don't take the view of the old Irish lady who was watching the Bishop in his garden teaching a dog to jump over a cane. She called to another old dame to come over and have a look. "Glory be," said the second one, "but it takes little to amuse the Holy Father." "Sure, that is not our Bishop," said the first one, "that is the Protestant Bishop, is it not?" "Well, well, the d——d old fool."

In your meetings here as well as in business at home you are going to find those who do not agree with you. I know they don't with me, as I had good reason to learn last summer when I inadvertently stirred up a hornet's nest, when, acting under the orders of the president, I sent out a series of letters regarding a line of material being used in an ice cream mix. Still, we can always find a way out gracefully, and reach an amicable conclusion. This can be illustrated by a little story. There was a Jew up in Washington who was sentenced to serve a term in Walla Walla. They don't get many of them there—whether they are too shrewd or too honest does not apply. When this man was brought before the warden, he was asked if he had a trade or profession. He replied, "I can make any kind of a coat, just as fine as you ever looked at." "I am sorry," said the warden, "but the tailoring department is all filled up." "Well," answered the Jew, "I could travel for you." He could see a way out, and I believe you can all do the same thing, but I trust the conditions will not be the same.

We, in the ice cream business, are greatly interested in our State and National Associations, if we are not, we should be. Here I wish to correct an opinion that at one time prevailed, namely, that the Pacific Association wished to consolidate or absorb the California Association to a point where they would lose their identity. As a representative of that association I can assure you this was not true in any way. Those of your members who have attended our conventions will bear me out in this. There is the most kindly feeling for the members of this organization, several of whom are also affiliated with us. As we see it, the state associations should each be in a position to deal with their own local conditions to obtain any real benefits. Your situation in California is different to ours, and to attempt to consolidate would be the same as the Pacific Coast National, and we would lose what we are striving to hold. In other words, we are taking in too much territory. As the man said, when he made the remark that he could lick the whole state of Minnesota—a rap on the nose convinced him of his error. If any manufacturer in any state wishes to come in with our bunch, they are sure of a hearty welcome, and all the hospitality we can extend. I am also sure the same would be true with anyone affiliating down here, but I wish to emphasize the fact that there is no thought or intention on the part of any officer or member of the Pacific Association to merge the entire coast into one concern.

Another Stabilizer is compromising. I remember a few years ago after a session of the Washington legislature when one of the food officials made the remark to a friend of mine, that he was going to see that we all turned out a 14 per cent finished product under the government ruling then in effect—that states not having a law to the contrary, would be compelled to meet it. We got busy and arranged a meeting with the Commissioner of Agriculture, placed our side before him, and asked for an 8 per cent standard. This was taken to the attorney general for an opinion, and he compromised in this manner—while the law had to stand on the books he would not make any prosecutions where we had a 10 per cent product. The next season we got the 8 per cent standard and that was some stabilizer for us—a drop of 6 per cent. Speaking of compromises, you may have heard the story of the Hebrew kid who was crazy over baseball. He used an old pick handle for a bat and a discarded bird cage for a mask—anything to be in the game. Father was too busy keeping the moths out of

The Ideal Light for Office, Freezing Room and Eskimo Pie Coating Room

In thousands of offices the soft, white light of Denzar is making rapid, accurate work possible because Denzar produces an even illumination throughout the room without glare, bright spots or harsh shadows. With Denzar installed in your office, your mixing and freezing rooms, and especially in your Eskimo Pie coating and wrapping room your employees will be able to work faster and better, because Denzar corrects the blinding glare of the Mazda lamp and makes artificial light as restful as daylight. Your local electrical dealer has or can secure Denzar for you or if not, we will ship direct. Write now for the Denzar catalog and learn more about this economical lighting unit which actually gives more light for less money.

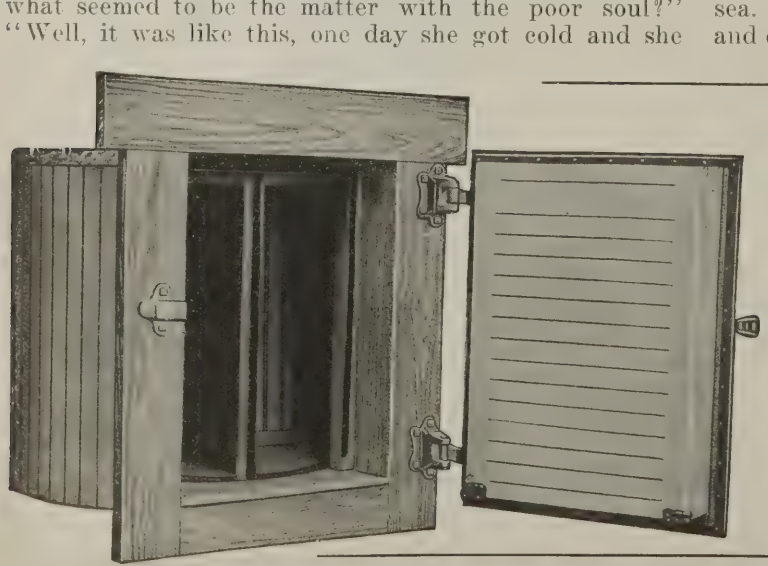
the clothing, to pay any attention, until Sammy got to be a league player and was getting real money, so one day when they were playing on the home grounds the old man went out to the game and had a seat right down in front. As the game progressed, there were two men out and three on bases, with Sammy at the bat. He soaked the pill across the lot and got to first and started for second, when the man on second got the ball. They kept closing in on him, and you know how much silence there is at such a time—as they were about to tag Sammy the old man jumped up and shouted, "Sammy, for God's sake compromise with them."

You must expect to give service to your association, we all get out of it according to what we give, so you cannot expect to get something for nothing. Don't think you have done your duty if you attend the annual convention, pay your dues and enjoy the program and entertainment furnished by those who have planned for the better part of the year to give you a good time, then you go out on a few parties chaperoned by Bill Hosking or Dudley Dorman, after which you go home and forget about it for another year. Try to stabilize your association by getting some other manufacturer in your section to come in with you. I know some of your members did not have a bed of roses during the last session of your legislature. Did the fellows who carried the load have the full support of the membership? They certainly were entitled to it. They needed that stabilizer, and I trust they got it, for there is nothing so discouraging to the man on the firing line as to have the rest sit back and "let George do it."

Manufacturers are continually confronted with new conditions and from experience will say, that most of them are brought about by people who break into the business who have the idea they can do the impossible, giving service that costs more than they receive for the goods, and lining some little shack with enough cabinets to serve a fifty gallon customer and otherwise "gum up the cards." This is the spot where you need a Stabilizer and need it badly, for there is no harder competition than this class. The salvation of the industry is for the manufacturer who does know his business, to go after this individual and get him in line. This may not be as easy as it looks, for that kind of a bird has an idea he knows it all and is hard to approach. He is naturally suspicious of your motives and will be cold and distant, but in time he may warm up and be a regular fellow.



There were a couple of Irishmen met one day who had not seen each other for some time. Casey said, "Hogan, did you hear I lost my wife?" "Indeed, I had not, what seemed to be the matter with the poor soul?" "Well, it was like this, one day she got cold and she kept getting colder and colder until at last she died." They sympathized with each other for a few minutes, when Casey said, "It must be a great consolation for you to know she is warmed through by this time!"

The supply men are a good type of Stabilizer also. They cover a lot of territory and usually keep their eyes open, and their order books handy, but those who really know the game are a source of information for the manufacturer, if he will take advantage of the opportunity. They are good judges of men and conditions, some of them have other qualifications that I will not mention at this time, but if your business has not been up to your expectations the old adage, that misery loves company, comes to your rescue, when he tells you confidentially, of course, that Bill Dreyer is not selling all the ice cream in and around San Francisco, you all know the feeling. I don't have to tell you what it is.

I do not know just what your secretary expected me to say ,or how much, but if anyone is holding a watch on me will say, the ordeal will soon be over. I have tried to bring out a few points that to me seem essential for a successful trade association. I will admit they may be rather disconnected, and you will think I began in the middle and worked toward both ends. In this, I have a perfectly good alibi. Several of the ice cream men know I am a reformed piano tuner—some say, the only one in the U. S. in the ice cream business. In that trade it is necessary to begin in the middle and work both ways, so in this paper I have approached it cautiously in the middle register, seeing no trouble I dropped down into the lower part, then worked up to the thin tones in the upper part, and if you have followed me you will agree I am running out, but I will at least have run true to my early training.

In conclusion, I want to thank those Californians who attended our Seattle convention and assisted us so much. We trust they were not disappointed. If they were, we are double so. We appreciate the membership from this state and hope to see it grow. We will at all times be glad to co-operate with your officers or individual members in any way possible for the betterment of the ice cream industry. I also wish to thank you for the opportunity of meeting with you and to know you have listened to what I had to say without any sign of violence. If I have brought out an idea that will be helpful I will feel well repaid.

I am reminded of a short story that seems to fit the occasion in closing. Two young men had attended the same college and graduated at the same time. One chose the ministry as his life work, while the other went to sea. They managed to keep in touch with each other, and one day it happened the sailor dropped anchor in the

Cleanliness Paramount

In the modern ice cream plant purity is the watchword and cleanliness is all important.

These factors of high quality production—the basis of profitable business—are quickly, easily and dependably maintained in thousands of ice cream plants by the sweet, wholesome, safe, sanitary cleanliness which the use of

Wyandotte
Sanitary
Cleaner and Cleanser

so positively creates.

This white, inorganic, greaseless cleaner purifies, sweetens, deodorizes and cleans clean. Its use guarantees faultlessly clean equipment, cans, holding tanks, pasteurizers, freezers and containers. It will not corrode or injure metal, is entirely harmless to the hands, and will leave all sour or stale places sweet and fresh.

An order on your supply house will place your cleaning on an efficient and economical basis.

city where his friend of the cloth was located. During his travels the sailor had picked up a parrot that was quite a fluent talker and he was very proud of it, so took it along when he called on his friend. After the usual greetings the sailor spoke of his parrot. The minister said, "This is quite a co-incidence, as I too have a well trained parrot." They brought both birds into the room where they gave each other the once over, when the minister's bird said in a solemn voice, "What shall we do to be saved," to which the sailor's bird replied, "Pull like hell or go to the bottom." This, too, I believe. is our lesson also. We need concerted work or we too will go to the bottom.

The President: I will be glad to near any question or comments, or discussion on the paper just read. It has been a very interesting paper.

Mr. Swanberg: I would like to make the comment that it is the best thing I ever heard in my life—humor and good sense put together.

The President: I should mention, which you will see on the program, that Mr. Walker is here as a guest of the association representing the Pacific Ice Cream Association, and we certainly appreciate the fact that he has come this distance to participate in our activities and good time here and add to the interest of our program by this excellent paper.

Any further comments or questions that you would like to ask Mr. Walker in regard to their association, or regarding anything germane to the subject? I think I should mention again what I spoke of last evening, don't forget the importance of the round table this afternoon. Anything that is on your mind or that has occurred to you that will be an appropriate subject to discuss or consider at that round table conference; anything that you think would be of interest, or anything that has occurred to you during the past year, or months, or that you would like to hear the views of others on and have discussed, just make a small note of it in whatever form you wish, pass it in to the secretary so that we may have those suggestions or points all in hand before we meet. It will add very much to the results and the good we get out of the meeting.

The next subject on our forenoon's program is the Effect of Gelatine on the Texture of Ice Cream, by Prof. Turnbow of the Dairy Division at Davis. Prof. Turnbow:

THE EFFECT OF GELATINE ON THE TEXTURE OF ICE CREAM.

Prof. G. D. Turnbow, Dairy Division, U. C., Davis, Calif.

Prof. Turnbow: I am frank to admit that when I started out to get information on the subject for which I appear on the program that I knew very little about it. I had some ideas from a practical point of view, but when you get into gelatine, you get into a technical subject and so some of the material may be a little bit theoretical. It will not apply absolutely in every case, however, and I will make that part of it short and I am going to give some information I think that is new to some of us, but probably most of us will make out some of the things I will give you this morning. If there are any questions, I would rather you waited until we get near the end of it.

Gelatine is regarded as an albuminoid but does not come strictly under this classification. It is an artificial derivative of collagen and is formed from it by boiling with water or subjecting to steam under pressure. It is manufactured from bones and hides of animals (cattle, sheep and hogs). It is made up of carbon, hydrogen, nitrogen and oxygen in the following proportions: Carbon, 76, Hydrogen 124, Nitrogen 24 and Oxygen 29 parts. It is a protein and is very easily digested. It is high in food value and it is said that gelatine aids in the digestion and assimilation of casein and butterfat found in ice cream.

Palatability of ice cream is a very important factor in the ice cream industry. The score card used in this contest allows 50 per cent of the total score to this factor. Gelatine is an important ingredient in bringing about palatability, inasmuch as it tends to prevent the growth of crystals (all kinds), and acts as well as a lubricant, in much the same way as vaseline would in a mass of small sand grains, because it forms a coat around each crystal. Both of these factors contribute materially to the smoothness of ice cream. One authority states that gelatine distributes and helps to retain the flavor.

Some manufacturers use gums, such as gum tragacanth, in place of gelatine, claiming that they can manufacture a cream that will stand up much better under hard handling. This may be true under some conditions, but from all information I have gathered, gum is more of a filler and is very questionably a binder. Virginia Experiment Station has done some very good work with respect to gum.

I have prepared a couple of little tables here that I

ACCURATE AND INSTANTANEOUS TESTING OF OVERRUN IS THE RESULT OF A GOOD TESTER.

would like to show you (placing before the convention two large placards showing the tables copied below):

Table I.

Eight Per Cent Cream—Loss in Weight by Belting of 500 Gram Ice Cream Brick.

Binder	Weight of each brick in grams after melting. 1 hour	2 hours	3 hours	4 hours
Control	454	315	193	119
4 oz. Gelatine per 10 gal.	485	385	281	150
4 oz. Gum Tragacanth per 10 gal.	482	346	218	118

TABLE II.

Nineteen Per Cent Cream—Loss in Weight by Melting 500 Grams of Ice Cream Brick.

Binder	Weight of each brick in grams after melting. 1 hour	2 hours	3 hours	4 hours
Control	475	357	235	122
4 oz. Gelatine per 10 gal.	500	447	354	253
4 oz. Gum Tragacanth per 10 gal.	445	292	151	50

Under Table I the gum tragacanth did not materially increase the hardness of the ice cream. The melted portion when the gum was used, was quite viscous and was not watery like the control.

In the second experiment the same methods were used as given under Table I. Here we find the gum decreasing the resistance instead of increasing it. An increase in fat lowers the resistance to melting in the presence of the gum. The gum tragacanth here increases the viscosity in the melted mix and makes a smooth and slightly higher colored cream.

I have put them this way: In one, ice cream which I call the control, contains everything that the other two did except it did not have any gum or gelatine. The next mix contained for ten gallons, four ounces of gelatine and there is four ounces of gum tragacanth. It was allowed to melt. At the end of one hour everything was weighed and in the case of the control, the one that had no gum or gelatine, weighed 454 grams; the one with gelatine weighed 485 grams, the one with the gum weighed 482 grams. Now, it is true that we had some kind of a binding effect on the ice cream in the control. It weighed a little less and did not stand up quite as long as the other two. However, there is only three grams difference between the next two.

I have heard some manufacturers say that the reason they liked to use gum is because it retarded the melting in the beginning. From this table, this is not the case. After melting one hour the sample containing the gum weighed a little less than the sample containing the gelatine. The sample containing the gum was a little more resistant than the control, showing some tendencies as a binder. You will notice the gum is less efficient than the gelatine. We would have been helped if we had not used any gum at all, because without any gum the gelatin weighed 119 grams, against 118 grams using the gum. We might say even that gum really conducts heat rather than retards it because the heat has penetrated that ice cream.

The President: There is a feature in that chart when I was looking at it before the meeting that it is not clear to me. I would like to call to your attention and have you explain it. The heading there is weight of each brick in grams, showing one, two, three, four hours, as though the weight had reduced, reduced in weight from 454 to 119. Do you count the weight of the unmelted part?

Mr. Turnbow: Yes, that is the unmelted part. The brick weighing 500 grams was placed on a board. First we weighed the board. As it melted we weighed the board.

That is for 8 per cent cream. Maybe now some of you are saying, I expect, "We do not care about that, we do not use gum anyway." That is true, but I know several of them in the state using gum. There were a couple of samples in the ice cream show had gum.

On the other table (pointing to Table II), we have 19 per cent cream, which is impracticable for commercial sale. It is the same kind of mix as the others. The same 500 grams were used, etc., and the gelatine, 4 ounces, at the end of one hour it had been weighed. Notice here, 445 grams against 475. You would have been a lot better off if you did not have the gum tragacanth in it. Notice how much faster with the increased butterfat we get remarkable reduction in the resistance of gum tragacanth. Only fifty grams melted at the end of four hours.

I will probably get in wrong here but really I cannot see any place for any of the gums in the ice cream industry. It does not add to the flavor. It does not add to the palatability and it does not add to the resistance in the melting point. I think I am more convinced that we have overlooked a good bet on gelatine. But I am speaking of certain classes of gelatine now.

Mr. Swanberg: You will get in wrong all right.

Prof. Turnbow: I think so. I am going to assume from here on that gelatine is the only practicable binder. Even then, great care must be exercised in the grade of gelatine used. With the assistance of Mr. Kassebaum, we have conducted various experiments in the laboratory to find a simple but efficient method of determining quality. Roger's Manual of Industrial Chemistry of 1920 states "that the melting point of jelly is generally speaking proportionate to the jelly strength." We worked from this idea and found that a solution of 1.5 grams of gelatine dissolved in enough water to make 100 c.c. of solution. The beakers used were 250 c.c. size and of a diameter of 2½ inches. All samples were heated to 160

degrees Fahr. to thoroughly put the gelatine into solution, and then allow to set at a temperature of 50 degrees Fahr. for 24 hours. The better grades of gelatine after going through this test will remain in the beaker when inverted and will have a thick, clear, jelly consistency. The poorer grades will be semi-liquid and in some cases only a viscous liquid will be the result.

I have prepared here in the room some samples. They have only set twelve hours and there is a difference in the body of an ice cream whether it is aged twelve hours or twenty-four hours. That is, an ice cream with a certain amount of gelatine is aged twelve and another twenty-four. You cannot expect the same in ice cream as far as your gelatine is concerned. I have six gelatines here (pointing to six beakers of gelatine which he placed on the table). We wrote to everybody to get these samples. We received stacks of grades of gelatine. We have taken six of them here and we set them last night. Here is a gelatine that was set last night (picking up the beaker and turning it upside down.) You can turn it upside down. Here is another gelatine you can do the same thing to it (illustrating), 1½ grams of gelatine, ½ c.c. Follow me on the gelatine, you cannot tip this over, can you (illustrating wtih another beaker which was practically liquid). Take this one (like water), I can pour it right out. Where is the man from Room 101, he can tell me what that is (laughter), it is all the same thing. I have taken two of the poorer grades, two of the medium and two of the better, there are six of them. This little test can be done in the laboratory, and I will tell you what it means.

The bacterial counts will run in all samples, and in every case the high bacterial count and the low jellying qualities were facts indicating that the above test was a good index to the bacterial count of gelatin. On this sample (illustrating with the watery gelatine) we found 40,000,000 per gram and on this sample we got 7,000 per gram (pointing to the stiff grade), and on this (pointing to the next consistent grade), 7,400 per gram. Seven thousand is the lowest we get in the United States. Notice the rough treatment it will stand (shaking the 7,000 gram beaker violently). To get the same result in your ice cream you would not have to use nearly as much of this (pointing to the best grade) as this (pointing to the poorest). (Resuming paper): Bacterial counts were run on all samples and in every case with a high bacterial count low jellying qualities were found, indicating that the above test is a good index to the bacterial count of gelatine. The strongest jells were of a comparatively low bacterial count. Solutions of gelatine of high bacterial count when incubated gave a putrid odor. These high count gelatines in the original package did not in all cases have an objectionable odor, some being almost odorless. In one case an average count of 200,000 was obtained on a gelatine of very low jellying strength, but the incubated sample contained a predominance of putrefactive organisms.

You know, we talk about the bacterial count of ice cream. I have come to the conclusion that a big bunch of it came from our gelatine. A health officer said to me the other day, "I am going to put a man on to do inspection work. I am going to check the bacterial counts of ice cream to put the quality up." I believe the ice cream manufacturer can do more to keep down the bacterial count in his ice cream by testing his gelatine. In every case, in all gelatines, where we got a strong jell we got a very low bacterial count. I might say this, too, we ran moisture tests on all these gelatines and they varied five, ten and on up, and there is one thing I naturally supposed, the higher the moisture, the lower the jell. Not so, the moisture count is no index to the quality of the gelatine. We checked it up and made sure from other authorities. There are no acids driven off except moisture.

The test I want to get across today is this one test. We run several others and we had a good deal of cooperation in some of them. Beakers containing jells were placed in a water about at 100 degrees Fahr. and the time required for each jell to assume a liquid state was determined. The water bath was kept at 100 degrees Fahr. (near as possible) during the entire time of melting. Great variations were found between the samples. Some gelatines required only six minutes to assume a liquid state and the samples varied from this to 24 minutes for the better grades. The time required to melt the gelatine was easy to ascertain and is a simple test that could be used in any factory without much trouble.

Other samples were prepared and allowed to freeze. The poorer grades of gelatine congealed in about the same length of time as the stronger grades, but the poorer grades formed long spines, much the same as water might freeze in a bucket. The stronger grades formed short, mealy crystals. Moisture tests on the original samples showed that in some cases the weak gelatines contained less moisture in the original package than some of the stronger grades. The action shown by this freezing test, I presume, is similar to what we may expect in ice cream, only not so extreme. In order to protect your quality it is necessary to use a gelatine that will keep these crystals as small as possible.

Through the courtesy of Mr. Seba of the Pure Milk Distributors, we obtained a device for determining the resistance to penetration of the jells. The essential part of this device was a plunger with a cone on the lower end. The entire shaft weighed 300 grams. Five per cent

jells of 100 c.c. volume were made up in one-quarter pint milk bottles and allowed to set for twenty-four hours at a temperature of 50 degrees Fahr. The plunger was placed upon the jell and the time determined for the cone to penetrate to the bottom of the jell. This method checks with the melting test described above. It is doubtful whether such a test is as satisfactory as the jellying and melting test. However, Mr. Seba deserves a great deal of credit for figuring up this device.

Numerous investigators tell us that "Gelatine retards super-cooling in aqueous solutions by preventing convection. In other words, it tends to hold the water in place so that it is frozen in situ. It is quite likely that in case of the ice cream mix containing the gelatine in a completely gelated stage (aged), the mix is imbued with a greater viscosity and hence there is less chance for convection within the freezer in the presence of the scrapers and beaters."

Mr. Zoller of the Washington Dairy Office, U. S. D. A., conducted a simple experiment in which he concluded that "when a very small quantity of gelatine is added to an ice cream mix it greatly increases the viscosity because of its enormous power of combining molecularly with water hydration or hydratation).

This gelatine here (indicating liquid one), if I left that for twenty-four hours would become a little heavier than that one (indicating the next firmer one). It gets a little thicker. With Mr. Seba's little device, while I am not absolutely sure in this statement, there seems to be a slight drying on top of that gelatine and the penetration starts slowly and then it goes rapidly as it gets down in and in a case like this we would have a very hard time in using the device because we could not record the time to drop the plunger.

That it requires considerable time, at ordinary temperatures, for the gelatine to become completely hydrated or set has been demonstrated. This slow setting of gelatine is very intimately concerned with the desirability of ageing ice cream mixtures which contain it."

Briefly summarizing the effect of gelatine in ice cream, we are safe in saying that if a gelatine of sufficient quality is used it has a desirable effect upon the palatability by producing a smoother and more digestible cream. A cream that is higher in food value and apt to be more evenly flavored, this being due in a large measure to the remarkable protective power of the gelatine on the formation of ice cream crystals. It is questionable whether there is a place for gum tragacanth under any condition in the ice cream industry.

Great care should be exercised in the purchasing of gelatines. There are many grades on the market and there exists a great variation in the quality of the gelatine. The ice cream manufacturer should ask that samples be submitted before purchasing his yearly supply and make the necessary tests to definitely determine that it is of the desired quality. A large enough sample should be submitted so that it can be compared with the purchased quantity.

I have only very briefly covered some of the minor effects of gelatine on the quality of ice cream, and there is left to be done a large quantity of investigation work to adequately furnish the ice cream man the information that he needs with reference to this important ingredient.

The President: Ladies and gentlemen, I want to say that if we had heard nothing during this convention except Prof. Turnbow's talk the convention would have been eminently worth while. It certainly is the kind of a talk and paper that we need.

Mr. Swanberg: I would like to ask a question. Do you suppose that if we lal started in getting the best grade of gelatine that the supply would be large enough?

Prof. Turnbow: Sure, you can force them to it.

Mr. Swanberg: I always understood that the supply and demand regulates the markets of the world. Is there enough, can there be enough made? At present you have supply and demand, but you have to force that. I presume that is the way it runs. Supposing that those who are making poor jelly find they cannot sell it; and so if the ice cream men now are up to date I know they cannot sell it—they can't sell me poor jelly. Can they get enough of the first grade?

Prof. Turnbow: I could not absolutely answer that question, but I think you can. I never heard of a shortage of gelatine, but I think it is up to each ice cream manufacturer to see that he gets his gelatine anyway.

The President: Gelatine is used in so many industries, the volume that is made is so large, it would seem to me that the ice cream people, if they made up their mind to do it, would have no difficulty in getting an adequate supply.

Mr. Swanberg: Thank you very much.

Mr. Dryden: Is it not the concensus of opinion of gelatine manufacturers that what they cannot sell for capsuls they unload on the ice cream men?

Prof. Turnbow: I have heard that said, yes.

Mr. Wilson: Is it your opinion that heating the gelatine over 150 degrees Fahrenheit you do not lose the jellying strength?

Prof. Turnbow: I have heard said that—a good many gelatine men have said that if you heat gelatine above 150 or 160 degrees Fahrenheit you do not get the jellying strength. We have heated those test gelatines at 204 degrees, a little better than 200 degrees and

Chalmers  Gelatine

1872 1922

For fifty years
An unfailing source of satisfaction

James Chalmers Sons
Williamsville, N. Y.

Chalmers Gelatine Sales Corp.
Richmond, Va.

we get just exactly the same strength jell as heated at 160 degrees. That being the case I think if I was pasteurizing before homogenizing I would put my gelatine in before it goes through. We have found 145 degrees—I do not figure any man would pasteurize lower than that—we found the gelatine loosened in first class shape. I might say, up at college we are putting our jelly in solution at 185 degrees and then putting it in a mix.

Mr. Dreyer: You would not recommend sprinkling it in the mix?

Prof. Turnbow: We are heating ours up much higher than the ordinary gelatine men tell us to, and in what tests we make, we get the same strength jell and we do get rid of some bacteria at 185 degrees.

Mr. Dreyer: Does it make any difference how you soak it in water and what quantity. I understand one gallon to one pound—that is eight pounds of water to a pound of gelatine, is that the proper proportion?

Prof. Turnbow: I think the manufacturers can answer that better than I can. We are adding cold water to it and we are putting in about one-half enough, to put our gelatine in the dry runs, just so it is almost in solution. Just sort of a semi-liquid state. I am not saying we are right. I have discovered gelatine is a pretty complex proposition. We do not find much about it.

Mr. Wilson: You say, no, by all means do not sprinkle it in?

Prof. Turnbow: Why not, because you put your gelatine in a solution and then that solution will become distributed more uniformly. If I get your point that by dumping the gelatine right into your ice cream when you pasteurize it. We are putting it in solution first. How much are you heating it?

Mr. Wilson: 145 degrees.

Prof. Turnbow: I do not think that is heat enough. The bacterial count in our lowest count was 7,000, which is good, and 40,000,000 per gram in the poorest. I would go as high as I could,—even 200 degrees and then have no reduction in the jellying strength and come nearer sterilizing our gelatine.

Q. We are putting in our gelatine dry. I do not think you have demonstrated any reason why you should not put it in dry?

Prof. Turnbow: How do you heat it?

Q. 150 degrees.

Prof. Turnbow: What is the bacterial count?

Q. 20,000.

Prof. Turnbow: What if you heated it more?

Q. It would probably be lower.

Prof. Turnbow: You can heat it to 200 degrees and you will agree with me that you will kill more bacteria.

Mr. Stiegler: You overlook the fact that the bulk of your ice cream is made of milk products. The bulk of it is made of "B" cream, is it not?

Prof. Turnbow: I am not sure of that.

Mr. Dreyer: Ninety-five per cent is made from "B" cream, from the tests in the southern part of the state. It is impossible to get cream for ice cream with a bacterial count of less than 200,000. That count is a low count for ice cream.

Prof. Turnbow: You understand I am just simply up here to put the question. I cannot answer them. I have my own ideas and I am quite set.

The President: The meeting was to bring out a discussion of this kind.

Prof. Turnbow: What advantage do you have in the dry state over the liquid state?

A. Why, not adding any water, mixing cream and butterfat you get plenty of moisture in your mix without the addition of water, and as far as I can see we get as good or a little better solution of the stuff in that way.

Prof. Turnbow: Maybe you do. I think that is a debatable question. You may be right.

Mr. Wilson: Does the gelatine take hold of the moisture in the mix? Then if you are going to put water in the gelatine beforehand, don't you reduce its ability to do that?

Prof. Turnbow: The amount of water you use is practically negligible. You have, we will say a 36 per cent solid mix. The small quantity of water you add with the large quantity that is in there is very small and you have a surplus in 6-10 gelatine. It will stand up a week if you use that gelatine.

Mr. Dreyer: If the gelatin is sprinkled in on the mix, where the mix is 145 degrees or even 150 degrees, while those particles are dissolving the coagulation and precipitation of the albumen is too severe and not evenly divided through the mix, but if you put it in a solution and then pour it in, it is divided more evenly throughout the mix. I think that is the reason water is used to dissolve it, aside from the fact that you are decreasing your bacterial count.

Prof. Turnbow: Oh yes, Mr. Dreyer just brought out a good point. There you get Mr. Dreyer's point of view. If you are homogenizing you get it fully distributed. Gelatine has a half a dozen different actions in the mix, and all we have been thinking of so far is its use simply as a binder. My idea is to give the gelatine just as good a chance as we can to work quick. Mr. Stiegler, do you add your gelatine after you get to 145 degrees?

Mr. Stiegler: All of it is in solution. Our trouble

two years ago was whether you can pasteurize and homogenize and mix with the gelatine in.

Prof. Turnbow: The main thing I want to do is to bring it before you, and I think you ought to bring it out yourself. I tried to get out of this talk but we have worked very hard at it and I am thinking I am apt to be right. We get ice cream from all your factories in from the dealers all the time, and we just watch this ice cream from time to time and know the methods they use. We have formulated our own plans but I am not saying I am right. I would like to see you ice cream men do the work on this.

Mr. Stiegler: Isn't it a fact that gelatine is all about the same composition, or it would not be gelatine?

Prof. Turnbow: Gelatine varies. It gets into such fine figures, so many decimals, it is hard to figure it out. Gelatine contains carbon, hydrogen, nitrogen and oxygen. Carbon 76, hydrogen 124, nitrogen 24, and oxygen 29 parts. It is practically commercially pure.

Mr. Dreyer: I was told by one who had a great deal of experience with gelatine that the proper way to put in gelatine solution was to use one can to eight pounds of water and bring it up not lower than to 185 degrees Fahrenheit and he said to be sure to get the best grade of gelatine that money could buy because if you have a poor grade of gelatine it will not stand that heat. It will destroy the jellying properties of a poor grade of gelatine. I would like to ask Prof. Turnbow if that is true. Will they stand that high temperature?
and as far as we can determine it is just as strong at 200 degrees as at 160 degrees. In the last ice cream trade journal, and the last review when they had all that dope on gelatine, you will see that the different salesmen have written up how to handle gelatine. You will find six different methods of putting up gelatine, six different temperatures and the majority do not heat it above a certain place. They do not agree.

Mr. Dreyer: High heat destroys the poor grade?

Prof. Turnbow: Yes, but I do not figure on people buying that poor grade of gelatine. (Clapping).

The President: Your discussion has dealt with the different grades of gelatine, designating high and poor grades, and your illustration has all been along that line. I want to ask this question, if you have no objection to answering it. Do you find any close relation between the various grades of gelatine as you designate them, the high grade and the poor grade, etc., did you find any close relation between the different grades, as you refer to them and the price?

Prof. Turnbow: No, the old prices, I think we will talk about 90c and 60c gelatine. The 90c gelatines in every case were better grades of gelatine. However, I found some 85c gelatines that fell right near the bottom. The two best gelatines that we got are the two highest priced gelatines and they are pretty close together, but they are different gelatines, and on the lower grades of gelatine they get as much for as they can. I want to say this, that all the gelatine men co-operated, that is 100 per cent. I don't think that if they knew what we were doing they would have come through as they did. In some instances they sent five pounds, and we appreciate it.

Q. I would like to ask Prof. Turnbow in reference to texture. In using high grade gelatine and cheap gelatine, where you would use a larger quantity, what difference do you find in the texture of ice cream.

Prof. Turnbow: The poor grade of gelatine has not the body to hold the crystal. It may partially surround the ice crystal but has not the jellying strength to hold the crystal from growing. If you put sand in, it will give you a seed to start crystalization, and the poor grade gelatine, even in increased quantities, has not the body to hold the crystal small enough.

The President: If there are no further questions we will pass on to the next number on the program.

The President: I am asked that Mr. Walker and Mr. Kugler step forward. These gentlemen are to be arraigned before the tribunal of this convention.

Mr. Dryden: I have been asked on the part of a certain committee of ladies and gentlemen present to have these two gentlemen stand before you. They both of them are from Washington, originally, and they have conspired in every northern ice cream meeting to upset all programs and precedent and they both behaved themselves so excellently here that this committee wishes me to thank them and present them with a little token of our appreciation. (Hands beautifully decorated basket of ribbons, flowers, etc., with cigars and cigarettes in the bottom, to Messrs. Kugler and Walker.)

Mr. Kugler: I just want to say a word. My affections with the two associations are about evenly divided. I go north every year and come down here every year and there is nothing I enjoy more than working with you and doing all I can to help the industry and to make tnings lively.

Mr. Walker: I do not think it is necessary for me to say a word after that. Of course this is my first trip down here and I hope it will not be the last. In fact I am kind of looking for an invitation for next year.

The President: I think there will be no objection to changing the order a little on the program. Mr. Miller has anotner engagement he is anxious to keep and it will accommodate him if we would call for Mr. Miller's paper the next on the program. Mr. Miller.

A Valuable Impression

A pleasing impression upon customers is of value. You can create one and at the same time save your goods from damage by spreading sheets of **TANGLEFOOT** in your show windows, especially over Sunday.

TANGLEFOOT will then be at work for you and will not only catch the flies, but attract the attention of people who pass your store to your efforts to keep your stock clean and fresh, and create in them a desire to use **TANGLEFOOT** themselves. This means extra sales to you. For 1922 **TANGLEFOOT** has been reduced 60 cents per case. This will allow you to sell at the old price, two double sheets for 5 cents, and make a profit of 50 per cent.

Remember **TANGLEFOOT** *catches the germ as well as the fly, and that poisons, traps or powders cannot do it.*

Vegetable Coloring and the Wisconsin Ice Cream Law

Newspapers Make Misleading or Incomplete Statements of the Law

NOW that Wisconsin ice cream manufacturers are again beginning capacity production of ice cream, the recent ice cream laws are being given considerable publicity, especially regarding the use of vegetable color in vanilla and New York or New York egg or custard ice cream. Many newspapers throughout the state have contained articles on the subject which were misleading or incomplete. The facts are as received from the dairy and food commissioner, that there is no law dealing directly with vanilla or New York ice creams, but the use of artificial color in these varieties of ice cream is prohibited by the adulterated food law combined with the recent law which defined and standardized ice cream in general.

A part of section 4600 of the Wisconsin law on the adulteration of foods, defines food as follows: "The term 'food' as herein used shall include all articles used for food or drink or condiment by man, whether simple, mixed or compound, and all articles used or intended for use as ingredients in the composition thereof or in the preparation thereof."

It is clearly evident that this definition includes ice cream.

Another part of this section forbids the sale of foods which are adulterated.

Then in section 4601, the law declares when an article shall be deemed to be adulterated within the meaning of the preceding section, first in the case of drugs, which does not concern us in this particular case, and second in the case of food. There are seven specifications in that section as to what is declared to constitute adulteration of an article of food. The sixth specification provides as follows: "If it (that is, an article of food, and in the case we are considering the article of food is ice cream) is mixed, colored, coated, polished, powdered or stained, whereby damage or inferiority is concealed, or if by any means is made to appear better or of greater value than it really is, or if it is colored or flavored in imitation of the genuine color or flavor of another substance, the said article of food is declared to be adulterated."

The Wisconsin Dairy and Food Commissioner holds that New York or New York egg or custard ice cream containing artificial color comes within the terms of this definition of adulterated articles of food.

To determine whether or not ice cream in any given case is adulterated under the terms of the law, it is necessary to know first what ice cream is by the terms of the Wisconsin law. Section 4601-4a states that, "In all prosecutions arising under the provisions of these statutes relating to the manufacture or sale of an adulterated, misbranded or otherwise unlawful article of food, the following definitions and standards for food products shall be the legal definitions and standards, to-wit:

We are now ready to proceed to section 4601-4a (Chapter 331 Laws of 1921) which gives a general definition and standardization of ice cream. It reads as follows: "Ice cream is a frozen product made from cream, or milk and cream, and sugar and may contain added milk solids, added milk fat, eggs, natural flavoring, edible gelatine or harmless vegetable gum, and shall contain not less than 12% of milk fat, nor more than one-half of one per cent of the said gelatine or gum or a mixture of the said gelatine and gum. The volume of the ice cream after being melted shall not be less than one-half the volume of the ice cream as manufactured and sold." That is the product which the Wisconsin Legislature has declared to be ice cream. Therefore, such ice cream, if artificial coloring is added, is an adulterated article of food under the sixth specification of the law defining adulteration.

J. Q. Emery, Wisconsin Dairy and Food Commissioner, in a recent letter writes: "What you call New York custard or New York egg ice cream with added vegetable color is neither specified nor defined nor standardized by the law of Wisconsin but, as before stated, ice cream under the definition quoted may contain eggs. Eggs, when forming a constituant part of ice cream, impart color to that ice cream and New York ice cream so called, is known to be an ice cream manufactured by the use of eggs and therefore the natural color of New York ice cream is an indication of the quantity or amount of egg used in its manufacture.

"We hold that to attempt to manufacture New York ice cream with one or two eggs and ten gallons of mix, with the addition of artificial color to make it resemble genuie New York ice cream made with eggs, comes squarely under the terms of specification six of the general law defining adulteration of foods. The use of the artificial color plainly in this case is to make the article appear better or of a greater value than it really is.

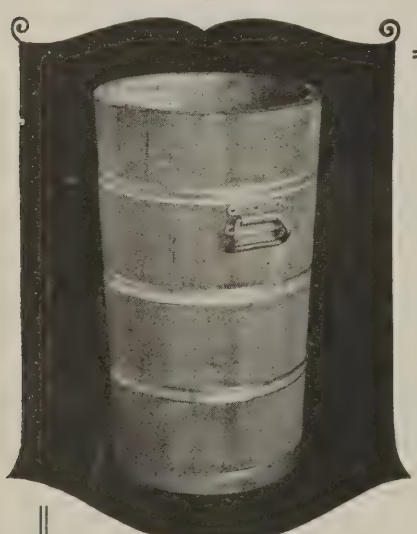
DAMROW BROTHERS CO.

MANUFACTURERS

Fond du Lac Wisconsin

GET THE CORRECT WEIGHT RECORD FROM AN ACCURATE CONTROL.



That is, to make it appear as though it was made from eggs when in fact it is not.

"In all this I have considered the relation of what you describe as New York custard or egg ice cream with added harmless vegetable coloring in its relation to and in violation of sub-section six defining what constitutes an adulteration of food. I wish to add, however, that the said article as described by you as we hold is also in contravention of the last part of the third specification as to what constitutes an adulterated article of food, namely, "If i t is below that standard of quality, namely, "If it is below that standard of quality, strength or purity represented to the purchaser or consumer."

The case of vanilla ice cream is exactly the same as that of New York ice cream, except that vegetable color is used in vanilla ice cream for the purpose of giving it a rich creamy color indicative of much butter fat when in reality there is little.

The legislature has defined and standardized some varieties of ice cream and has specifically authorized the use of harmless artificial coloring in certain ones of these, namely, fruit ice cream, nut ice cream, orange ice cream, lemon ice cream, wintergreen ice cream, and maple ice cream. The legislature has expressed its judgment that the use of artificial coloring is those kinds of ice cream would not be fraudulent or misleading.

It may be worthy of note, also, that it is not permissible to use artificial coloring in other varieties of ice cream than those specified even though the manufacturer were to state on his invoice that such coloring was used and the retailer were to put up conspicious posters in his store to the same effect. The Wisconsin legislature has made no such provision and, on the contrary, has emphatically repudiated and turned down a bill containing such provisions.

A New Packing Tub

Built of Douglas Fir, a Pacific Coast shipbuilding timber; selected for its ability to withstand salt water and "stormy" handling.
A dove-tailed, double bottom 2 inches thick; armoured with a 12 gauge, galvanized iron band.

VOIGHT BILL PASSES THE HOUSE.

By a vote of 256 to 40 the House of Representatives on May 25th, passed the Voight Bill H. R. 8086. The bill now goes to the Senate.

One slight amendment accepted by the friends of the measure was offered by Representative Towner of Iowa in order to clarify the intent of Congress. Passage of this bill by the House constitutes a great moral victory for the Milk Producers of the nation. The bill, as it passed the House, follows with the Towner amendment underlined:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled. That whenever used in this Act—

(a) The term "person" includes an individual, partnership, corporation, or association;

(b) The term "interstate or foreign commerce" means commerce (1) between any State, Territory, or possession, or the District of Columbia, and any place outside thereof; (2) between points within the same State, Territory, or possession, or within the District of Columbia, and through any place outside thereof; or (3) within any Territory of possession, or within the District of Columbia; and

(c) The term "filled milk" means any milk, cream, or skimmed milk, whether or not condensed, evaporated, concentrated, powdered, dried or desiccated, to which has been added, or which has been blended or compounded with, any fat or oil other than milk fat, so that the resulting product is in imitation or semblance of milk, cream, or skimmed milk, whether or not condensed, evaporated, concentrated, powdered, dried, or desiccated, **and as much is an adulterated and deleterious article of food and when marketed as such constitutes a fraud upon the public.**

.. Sec. 2. It shall be unlawful for any person to manufacture within any Territory or possession, or within the District of Columbia, or to ship or deliver for shipment in interstate or foreign commerce any filled milk.

Sec. 3. Any person violating any provision of this Act shall upon conviction thereof be subject to a fine of not more than $1,000 or imprisonment for not more than one year, or both; except that no penalty shall be enforced for any violation occurring within thirty days after this Act becomes law. When construing and enforcing the provisions of this Act, the act, omission, or failure of any person acting for or employed by any individual, partnership, corporation, or association, within the scope of his employment or office, shall in every case be deemed the act, omission, or failure, of such individual, partnership, corporation, or association, as well as of such person.

NEW FIRM DOING BUSINESS.

The City Dairy and Ice Cream Company, St. Joseph, Mo., incorporated on April first, with capital stock of $20,000, and is now busy manufacturing ice cream. The new firm is only manufacturing a complete line of ice cream but expect to handle other dairy products in the future. They have bought a considerable amount of new machinery and are operating in the building of the St. Joseph Warehouse and Cold Storage Company. C. R. Haas is president and general manager of the corporation, and H. C. Heschman is treasurer.

No man can live with a cow and treat her decently that is not a broader, better man at the end of the year. —Hoard.

North Carolina Ice Cream Manufacturers' Association

Bulletin No. 8, by A. E. DIXON, Secretary

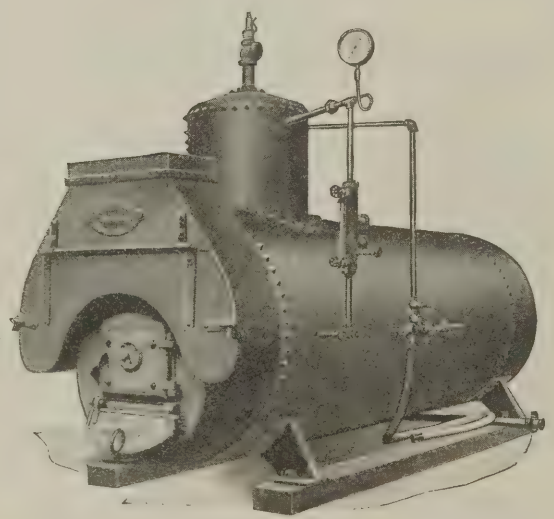
TRUST all our members received the extracts from the State law regarding the washing and returning of cans. Should you require an additional supply, kindly advise the writer and more will be sent you.

I wish to call attention of the members to a practice made by Dagoes and Greeks where they make a low grade of cream of printing the words "Ice Cream Compound" in small letters placed in an obscure and inconspicuous place at the fountain, and on their windows, etc., label and advertise it as "Ice Cream." This is clearly a violation of the law and works a hardship on the Manufacturers who are endeavoring to comply with the state laws. Mr. Allen promises co-operation in trying to eradicate this evil, and you will please give me the names of anyone in your town making this a practice so I can send the names to Mr. Allen at an early date. Kindly do not neglect to do this, as it is to your interest to assist in this matter.

Recently I had a dream and thought I went to the Ice Cream Men's Heaven and upon entering the pearly gates I found emblazoned on the wall in front of me the following creed of the Ice Cream Customers, and after reading it I said, "This must be Heaven:"

"I am going to give you a standing order for the quantity of Ice Cream I am certain to use every day.

I am going to order "specials" as far ahead as possible by mail. If I have to use the telephone or telegraph I expect to pay the charges myself, and I'll get the message to you in reasonable time before the train leaves.



I am going to wash out the cans as soon as they are empty, of course, and I am going to send all empty tubs and cans down to the depot every day when the dray calls with the day's supply of Ice Cream.

I am going to use all the good advertising matter you send me just as if I had to pay with my own money for it.

I am going to talk to people about Ice Cream and sell it—not merely dish it out over the counter.

I WILL PAY CASH ON DEMAND."

(Permission Old Man Pope.)

Before buying a boiler do not fail to investigate the superior merits of the famous

Leffel Scotch Marine Boilers

built in a variety of sizes from 6 H. P. to 100 H. P., and to meet all requirements of the different State Boiler Laws. This boiler meets in fullest measure and most economical and satisfactory manner every requirement of the trade.

This Company also builds Vertical Boilers in sizes of 2 H. P. and larger.

Box 328. SPRINGFIELD, OHIO

NEW CHERRY CATALOGUE.

We are just in receipt of the new 232 page general supply catalogue No. 1009 from the J. G. Cherry Company, Cedar Rapids, owa. It is attractively bound in red, with black lettering, and is conveniently sub-divided into six sections, as follows: Creamery Supplies, Ice

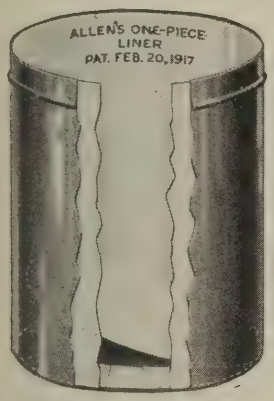
Cream Machinery and Supplies, Dairy Supplies and Equipment, Cheese Factory Equipment and Supplies, Pump Section, Mill and Transmission Supplies.

It appears to be one of the most complete supply catalogues ever published. We are sure the Cherry Company will be glad to mail any of our readers a copy of this excellent book upon request. We believe you will want to have it for ready reference.

FATHER'S CHANGE.

Willie (to his father, who had recently married the second time)—"There's a shop in High Street just like you daddie."

Father—"Shop like me? What do you mean?"



Willie (getting near to the door)—"Why, it's under entirely new management."—Edinburgh Scotsman.

A Letter recently received reads in part:

"The effect of **ALLEN'S ONE PIECE SANITARY CAN LINERS** in our Ice Cream Cans is magical.

Suggestive of Health, Purity and Prosperity, which combined with our own Sanitary Methods of Manufacture insure our product to be Superior to all others.

Our Slogan hereafter will be **A LINER IN EVERY CAN.**"

What an Advertising possibility. Can you afford to miss it?

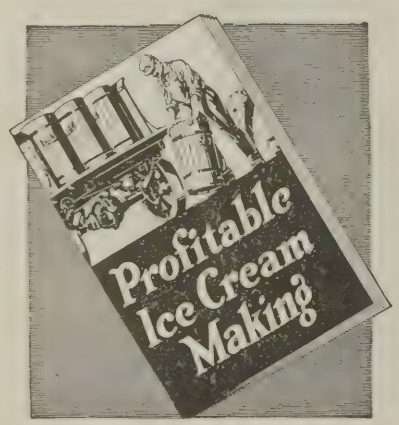
PACK YOUR ICE CREAM IN THE RIGHT KIND OF CANS.

FINE NEW ICE CREAM PLANT FOR LOS ANGELES

With the completion of the Globe Ice Cream Company's new plant, Los Angeles can boast of one of the finest ice cream factories in the entire country.

The size of this plant is 148 by 276 feet, and is two stories high. It is of first class construction, and is a strictly fireproof, sanitary, daylight factory throughout. The windows start at an elevation of 12 feet from the sidewalk and extend to within two feet of the roof. The foundations and steel work in the present structure are placed so that they will carry the additional load of two more stories should it be necessary to add them. The plant is equipped throughout with Davis-Watkins machinery. No expense has been spared, either in construction or equipment, to make this one of the most modern, efficient plants in the country.



The plant has a daily capacity of 12,000 gallons of ice cream, running one shift of eight hours. Both bulk and brick ice cream are being made, and in time ice will also be manufactured. At the present time, since working from February 1st, a yearly gallonage of approximately 400,000 gallons is under contract. This in spite of the fact that the new plant is not yet open.

This company is capitalized at $357,000. The officers are Will E. Keller, President; A. A. Comey, Vice President; Marco H. Hellman, Treasurer; and J. M. O'Brien, Secretary. The plant will be under the management of Mr. Comey.

Deliveries will be taken care of by a large fleet of Walker electric trucks, all equipped with refrigerator bodies. These bodies have a capacity of 350 gallons of ice cream, 6,000 pounds of ice and 1100 pounds of salt.

It is expected that this plant will be open for business on or before June 15th. Many novel advertising features are being planned and prepared, and the present outlook for business is far beyond the original expectations of the company.

This Book Tells How

HOW to cut down your percentage of solids fat and at the same time improve the quality of your cream — when and how to most successfully use cream, sweet butter, condensed milk or powdered milk — how to make brick ice cream without redipping — how to increase your overrun — most successful brine temperatures — best methods of using gelatine — proper sugar proportions in relation to quality and overrun — savings and improvements possible by correct use of ripeners.

These are just a few of the subjects covered in Mr. Thomas' "Profitable Ice Cream Making." Page after page is devoted to this kind of valuable, profitable, useful information. It is a book that you cannot afford to be without. Order yours now.

The price is only $1.00 postpaid

J. G. Cherry Company

ILLINOIS ASSOCIATION OF ICE CREAM MANUFACTURERS.

Extracts from Bulletin No. 27.

Some time ago the American Railway Express Co. filed a petition with the Illinois Commerce Commission for permission to put into effect on intrastate shipments in this State, Official Express Classification No. 27, advancing the estimated billing weight on 5-gallon shipments of Ice Cream from 100 to 115 pounds.

The matter came on for hearing before the Illinois Commerce Commission in Chicago on November 17th.

This Association strenuously contested the application of the carriers for this increase, and we are now advised that the Illinois Commerce Commission has denied the advance. Therefore, on intrastate shipments in Illinois, the billing weight of a 5-gallon packer of Ice cream remains on the old baisis—100 lbs.

The Express Company has been directed by the Commission to publish an exception to their classification in accordance with the ruling therein referred to.

The foregoing again illustrates the value of this Association to Ice Cream manufacturers in this State. Had the advance been granted the carriers—which would undoubtedly have been the case had not the contest been made by this Association—your experience would probably have been the same as that of manufacturers in states where the 115 lb. weight basis is in effect on intrastate shipments: approximately 50% of your shipping business would have been lost to you.

As you are of course aware, it costs money to handle cases of this kind. A special appeal is therefore made to those in arrears to pay their dues at once in accordance with bill enclosed. We need money to carry on our work, a typical instance of which is the case herein referred to. Please send check by return mail.

ICE CREAM MANUFACTURERS CONSOLIDATE.

The Ellensburg Produce Company and the Bradner Company, both creamery companies of Ellensburg, Wash., were recently consolidated under the name of the Ellensburg Creamery Company. Mr. Hull, manager of the Ellensburg Produce Company in Seattle, completed the plans of the transfer. In the past both local plants were subsidiary plants of larger Seattle companies. Under the new organization the Ellensburg Creamery Company is a separate corporation, managed locally but with the advantage of having a big Seattle concern to take any surplus products and making it possible to manufacture locally the entire cream output available.

All the interests of the two companies in this valley are taken over as one and the consolidated plant will be operated in the building formerly occupied by the Bradner Company. The best and most up-to-date equipment of the two plants will be installed in the plant and the older equipment will be disposed of.

George Bales, former manager of the local plant of the Bradner Company, is to be manager of the new Ellensburg Creamery Company.

J. M. Amundson, who for the past year has been manager of the Ellensburg Produce Company plant, has purchased a creamery outfit and expetes to open a new creamery in some other locality in the near future.

WILL YOU HAVE A LARGE OR SMALL FREEZER?

(Continued from page 70)

planation, as what is a better overrun to one manufacturer may not be to another. I presume you mean a greater overrun which is universally accepted as better overrun. However, from the point of view of body and texture and economy in dipping, the better overrun is the lower overrun and it is sometimes a problem for the freezer operator to keep down the overrun rather than increase it. This is too often the talking paint of the freezer salesman—that his freezer is able to produce a high overrun—leastways, in our estimation. He might better lay stress upon the fact that the overrun is more evenly controlled.

If a 40 quart freezer will do the work as well, it is logical to assume that the manufacturer must consider the expense involved in purchasing his freezers as well as the overhead which they carry. In our estimation, it is better to work a 40 quart freezer overtime during some of the warmer months than to have twice the capacity stand on the floor idle during the winter months. The fact that there is a saving in floor space, motor power, labor, etc., is all very true but there are other considerations, as above mentioned, and undoubtedly many more.

* * *

Just a Mighty Good Reason.

Reply:—There are reasons; I suppose every manufacturer has a different opinion. My reason is that we have installed a 15 ton compression, new hardening rooms, batch-mixer, and various other improvements in our plant this last winter at an expense of nearly $9,000, and as we are in the habit of not doing anything unless we are sure of carrying it through, we had to forget about the freezers for the time being.

Our plant is an up-to-date, sanitary ice cream plant; our freezers are not so very old and they still give good service. When winter comes around again, and we are not closed up by the court, we will install new freezers. We realize what these new freezers mean to the business, but it takes money to pay for them.

* * *

Use Larger Machines When Old Ones Wear Out.

Reply:—In our case I am frankly stating that our only reason is that our machines at present are comparatively new and we do not feel that we can go to the added expense and change over a perfectly good machine for one that, in our estimation, will not warrant this additional expenditure. Should our machines get in such shape that it would be profitable to buy new ones, we would not hesitate at all to buy the larger type machines.

* * *

Larger Machines Being Installed.

Reply:—We do not think that many large manufacturers who are purchasing new equipment are putting in 40 quart freezers except in some cases where they feel that the smaller size machine is better adapted for the manufacture of brick cream, due to the fact that it does not take so long to draw out the batch into bricks as it does with a larger machine, and where the larger machine is used, there is considerable additional "swell" towards the end of the batch, due to the continued beating it receives.

* * *

Reply:—Answering your letter of May 20th asking why the Ice Cream Manufacturers stick to the old type of 40 quart freezers. I will say that I did not know that they did in general. We are using a battery of forty quart freezers at the present time but when these wear

Make It Better—

Make It With ESSEX

MAKE it with Essex and make it a better ice cream; better for the youngsters because it is more easily digested and assimilated, and better for the grown-ups, too. Make it with Essex because Essex is economical. With a minimum quantity used per batch the texture and grain of the ice cream is finer, without loss of body; which is economy based on cost per pound. Make it with Essex because the uniform quality prevents variation in the ice cream. Make it with Essex—because Essex gelatine is absolutely pure, sweet, odorless, wholesome. Shipments can be made from Boston, New York, Philadelphia, Chicago, St. Louis, San Francisco.

Essex Gelatine Company

Manufacturers

Member Association MEMBER Ice Cream Supply Men

out we will replace them with larger freezers. We have one 60 quart freezer now and same gives us just as good results as a 40 quart size.

* * *

Forty Quart Freezers Do the Work.

Reply:—We are told that the large type does the work better and more satisfactorily, with numerous reasons, claiming to produce a more velvety product and a better overrun. Do we know this to be true? We have just been told.

We have never had any experience with any other freezer then the 40 quart freezer. Our freezers are producing cream as good as any on the market. Our machines yield just what they are supposed to.

Why should we want for any other.

* * *

Doubtful of Advantages.

Reply:—Your question is the best inducement I have seen yet to encourage the use of the larger size freezer. I intended to buy one of the large size, but the salesman did not say that it made better ice cream, larger overrun, saved in motor power and labor, but he told me they were not very successful yet and that one firm had bought the third drum for replacement inside of one season on a single freezer of the large type.

* * *

No Advantage in Large Machines.

Reply:—I am using forty quart freezers and I believe that there is no advantage in using a large machine at this time when our business is gradually developing into a specialized one.

* * *

Prominent Supplymen's Opinions.

The best way for me to answer your question is to enclose you a series of carbon copies of letters from satisfied users of the larger typed machines.

The qualifications specified in these copies particularly apply to overrun and quality which are both the important factors the manufacturer is interested in; as regards the other economies, they are self-evident, viz: Motor power on 120-quart machines, 7½ H. P. Motor power on its equivalent in 40-quart machines, 9 H. P., an economy of about 16% in power; difference in first cost of 120-quart machine and its equivalent in 40-quart represents an economy of 25%.

Space occupied by 120-quart machine, 11x6 ft. its equivalent in 40-quart 12x5 ft. over 50% saving in space. As regards up-keep, the larger typed machines are of a heavier and sturdier construction and cuts the up-keep fully 50%, thus reducing the possibilities of break-down.

Regarding labor, one man can take care of two of these machines with ease, whereas it would take two men to look after its equivalent in 40-quart machines.

The testimonials referred to above are as follows:

We are now using three 120 quart freezers going on the second year. We are very well pleased with their performance in all ways.

They freeze in same time as our 40 quart freezers. Jackets keep tight even with our 20 degrees below zero brine and we are particularly well pleased by the manner in which they empty themselves without squirting all over.

* * *

We have used one of your 120 quart freezers all season and must say we are very well pleased with it. It produces a good overrun of smooth, velvety ice cream and in the same length of time it takes to turn out a batch with a 40 quart machine.

* * *

It is a great pleasure for us to say that we are getting much satisfaction with your freezers. We are now using five of them; they are easy to operate, and with brine at a temperature of zero to 4 below zero Fahrenheit, we freeze a batch (120 quarts) in 12 minutes.

* * *

A Variety of Reasons.

I can think of several reasons why the manufacturer of ice cream might prefer a 40-quart freezer, or a battery of 40-quart freezers to fewer unites of a larger capacity.

If his gallonage is not sufficient for more than one large capacity unit, using more units of a smaller capacity is insurance against a general tie-up in his plant because of any single unit's failure to perform. A one legged dog with an injured foot can only crawl, while a four legged canine may have one or even two injured feet and still chase a cat.

Then, too, there are men so highly satisfied with the performance of the smaller units, that they refuse to be convinced that the larger units are as practical and efficient in their operation as the smaller sizes. Just as, a few years ago numerous ice cream manufacturers insisted that the old fashioned upright freezer produced a better quality of cream than the horizontal brine type. Please understand that I am not agreeing with the man who holds this prejudice against the larger units, but simply answering the inquiry which your letter contains.

There are men, too, whose conservatism prevents their disposing of equipment which has only partially outlived its usefulness in favor of more expensive equipment because of an old fashioned prejudice against borrowed funds, or because of their failure to see the economy of investing in new equipment of any kind while their present machines are operating satisfactorily.

There are many manufacturers of ice cream who are inclined to think that the larger capacity freezers are a fad, bu

The small ice cream maker grins, and the large manufacturer chuckles. They both use *VISCO* in their mix. Read about this latest application of science to your industry.

RETINNING ICE CREAM CANS

Special Department

WE DO REFINISHING of old ice cream cans in a special department of our plant which devotes its entire time throughout the year to doing this one thing and doing it well.

OLD CANS MADE NEW AT LOW COST

And we do know how to fix up your otherwise hopelessly rusty old cans so they will be tight and bright and good as new. IT IS NOT EXPENSIVE and PAYS YOU A DIVIDEND. A can retinned by us has a thicker coat of Pure Block Tin than when new.

SAMPLE CAN RETINNED FREE

This is the time of year to send cans for renewal. Send us a sample can NOW. We will repair and retin it without charge and return it promptly, so you can see the quality of our work. Write us when you ship it, so we will know whose it is, and we will do the rest.

OAKES & BURGER COMPANY

Established 1873 **CATTARAUGUS, N. Y.**

such men are, of course, exceptions, and decidedly in the minority.

There are many manufacturers whose daily gallonage does not warrant a larger unit than the 40-quart size, but we assume of course that the inquirer does not refer to a manufacturer of this size.

* * *

Larger Types in Demand.

I would say that the ice cream manufacturer is not sticking to the old standard 40-quart type of freezer, in fact installations this current season are very much larger upon large capacity freezers, than upon 40-quart machines.

The manufacturers of the U. S. Freezer were pioneers in development and encouragement of the sale of very large capacity machines. No one before had thought of the possibility of building a freezer as large as 160-quart capacity. When this machine was first introduced at the Dairy Show in 1920, the majority of people who looked at it admired its size and sturdy construction, but were dubious about the practicability of such a large unit. However, the experience since then has entirely justified the faith of the manufacturers in constructing a machine of such large capacity. Many installations of this sized machine have been followed with orders for one, two, or as many as eight additional machines.

In this current 1922 season, it is the writer's belief that the 120-quart size has been the most popular seller of the entire U. S. line. Besides that, many sales of 60-quart, 80-quart, and 160-quart machines have been made.

I believe you will see from this situation that the majority of ice cream manufacturers have definitely turned the corner on this proposition, and are replacing their 40-quart machines with larger units.

* * *

Depends Upon Size of Business.

Reply:—On the freezer question, I feel that there is a field for not only the 40-quart freezer but the machine of larger capacity, this governed entirely by the size of the plant, the volume of business handled, etc. The large capacity machine offers some advantages from the standpoint of economy in space, a slight saving in motor-power, a little less initial cost per gallon of capacity, etc., but do not overlook the innumerable smaller plants who do not have the capacity or amount of business to justify installation of the large size machine. From the standpoint of finished product, overrun, quality, etc., one machine will do exactly as good work as the other.

It is my judgment that unless the plant has a volume sufficient to justify a capacity greater than that to be obtained from 5 or 6 of the 40-quart freezers, it is advisable to stick to the 40-quart freezers. A larger capacity would justify installation of some of the larger machines.

The 40-quart freezer has been found more desirable for the handling of brick ice cream work than the larger machine, and observation will show that practically all of the larger plants where the large capacity machines are used on the plain goods, the 40-quart machines are utilized for brick work.

* * *

Satisfactory for Large Cans.

Reply:—It seems that the large capacity freezers, 80-quart, 100-quart, etc., are entirely satisfactory for pulling cream in the 5 or 10 gallon cans. Experience indicates, however, that the large capacity freezer is not quite adapted to filling the smaller cans or slabs for brick work; because of the holding capacity of the machine and the fact that the drawing of the cream is necessarily slowed up considerable over the time obtained in filling the large containers.

"A NOTE OF OPTIMISM PERVADES ICE CREAM INDUSTRY,"

Says E. F. Wellinghoff, Director of Sales for the Creamery Package Mfg. Company.

The writer's duties require that much of his time be spent on the road and whether east or west, north or south, careful observation and investigation indicate there is no question about the strength of the ice cream industry.. The leading manufacturers in all sections, are building their business on a solid foundation, indicating their belief in a permanent and successful future.

The feature that appeals most to me of course, is the rapidity with which they are adopting modern labor saving machinery. Large capacity freezers are replacing the 40 qt. machines; jet can washers are rapidly superseding other methods for washing and sterilizing milk cans and packing cans; mechanical refrigeration is everywhere superseding the ice method; and homogenizers are now considered a necessary part of the equipment of very ice cream plant.

Another thing that appeals to me is the improvement in the quality of the goods produced. Most ice cream manufacturers now have vision enough to understand that if they are going to encourage a greater consumption of ice cream on the part of the public they must furnish them a better product.

Competition, of course, is very keen in all parts of the country and in some sections particularly, it seems to be a stimulant to the production of higher quality cream and a greater ice cream consumption. There surely is room for all and the manufacturer who attends to his own business and turns out a good product at a reasonable price, is not going to suffer any from competition. It frequently happens that the greater the competition, the better it is for everyone, for greater effort is made to educate the public to the value of ice cream and hence more ice cream is consumed.

The south in particular is developing in splendid shape. Most of the plants that are established there are well built and well equipped. Of course the south has not been educated to the value and excellence of ice cream as much as has the north, but that will come and those now established in that section have a most promising future.

To sum up conditions as regard the ice cream industry, everything looks favorable to a good healthy growth for the future. Optimism prevails everywhere, quality is being improved, more cream is consumed and the business of today is on a firmer and better foundation than ever before.

Detroit, June 30, 1922.

Editor The Ice Cream Review:

Most ice cream manufacturers with whom I have talked tell me that their sales in May, 1922, are showing a decided increase over May, 1921. In every part of the continent with which I am familiar there has, too, been a large increase in the number of ice cream manufacturers. In some sections there is a marked tendency to "buy" business by giving concessions that are wholly unwarranted. Wherever possible certain types of retail dealers are playing one manufacturer against another to secure lower prices or their equivalent in the way of free cabinets or extra ice, etc.

Two manufacturers in a certain Michigan city deal with these gentry quite effectively by having a thorough understanding between themselves on all these points. When Mr. Dealer comes to one with a tale about the other fellow offering him a lower price or agreeing to pay express, etc., he immediately calls him up, states the charge over the telephone and asks him to affirm or deny it. Mr. Dealer, confronted with the point blank denial of the charge, sees that his little game won't work and doesn't try it any more. They tell me that by this procedure they have practically eliminated concession hunters and each is doing a profitable business. They are not haunted by the suspicion that the other fellow is out to steal trade.

I CALL UP MY COMPETITOR.

I notice, too, that the increasing capacity of ice cream plants and their increasing number is fostering a policy of more intensive cultivation of the territory to get the individual to eat more ice cream, summer and winter alike. It is being recognized that this constructive work is both the most profitable and the most permanent.

C. W. ESMOND,
Frederick C. Mathews Co.,
"Servants to the Dairy Industry."

* * *

New York, N. Y.

Conditions as I have found the ice cream business through the south and southwestern territory past sixty days have been anything but favorable.

There are reasons for this over which no man has any control, the weather is what makes or breaks the ice cream manufacturer and up to ten days ago it had been raining constantly. The past ten Saturdays and Sundays have been rainy and cloudy.

Since weather became settled the business took on a great spurt and, in my opinion, if nothing unforeseen

INDICATIONS POINT TO BIG SUMMER BUSINESS.

Just before going to press we received a letter from Chris T. Hollinger, live wire representative of the Hudson Manufacturing Company, which contains such interesting news of prospects for the season's business that we made a special effort to get it in this month's issue.

Mr. Hollinger says in part: "I have been in Texas, Louisiana, Arkansas and Tennessee since Jan. 12th and returned to St. Louis on April 15th. Then I made a flying trip through Wisconsin, after which I left from Chicago for the East, stopping at Washington and in Ohio.

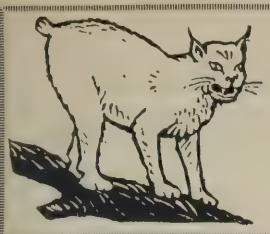
"Prospects seem good for a big ice cream season, and all manufacturers that I have talked to are looking forward to a large output. While prices are very low in nearly every section, all are making a good grade of ice cream. I think prices are too low, quality and service considered.

"Note that the National Ice Cream Manufacturers' Association and the Supply Men are going to hold a big show in Cleveland, Ohio. We are inviting every ice cream manufacturer we meet, and are sure we will have a good crowd."

It looks as if the ice cream business is due for a big boom this summer.

* * *

Conshohocken, Penn.



Two or three times we promised to write you a letter and give you some stuff for printing.

It hasn't been our fault that we haven't kept our word. The people we depended on fell down on us, and another plan we had in mind necessitated some personal work on the part of Mr. Hofstetter, who has been sick, and myself, and we simply could not get to it.

If you will notice the advertisement we prepared for the June issue, you will see that we stated, "We are producing more ice cream cans a day than any can factory in the United States."

If we are producing more ice cream cans, we are also selling more, and that means that we are all so busy that we cannot do anything else at this time. It also means that business is good for the Can Department. Thanks to your magazine which has done its share to make this possible.

AERIAL ADVERTISING.

The National Baloon Race which started from Milwaukee recently created a big sensation. Newspapers from all over the country printed news of the progress of the race, and in those localities over which the balloons passed a big demand was noted for arnica and similar lotions to alleviate the neck stiffness acquired from unaccustomed position of looking upward. Most of these purchases were made by men, which is accounted for by the fact that since the upward trend of women's skirt styles the neck muscles used in looking upward have grown weak from disuse.

The interest shown in this race proves that air travel is still enough of a novelty to arouse curiosity without much effort. The Morton Salt Company tried out this idea in advertising their product last fall, and the result was successful even beyond their expectations. Mr.

This is the carnvan of the air that the modern salesman uses in calling on customers. Used by H. A. Stevens of the Morton Salt Company.

H. A. Stevens, district sales manager of this company, and also secretary of the Hoosier Wildcats, was the star performer.

The trip was made October 21st and 22nd. Mr. Stevens was picked up, literally and figsratively, at Cairo, Ill., from which point they moved to Metropolis, Illinois, and Paducah, Kentucky, and then back around the Ohio River into the Mississippi, stopping at Hickman, Kentucky, Caruthersville, Missouri, Osceola, Arkansas, finally landing at Memphis, Tennessee. Souvenirs were dropped overboard along the route. Mr. Stevens says that it is trips of this kind that make some of the Wildcats wild.

* * *

Replying to your letter wherein you ask my opinion of general conditions at present and prospects for the future.

Being in the salt business you can readily see that my line is one which would act as a very good barometer by which you can determine what activities are going on among ice cream manufacturers.

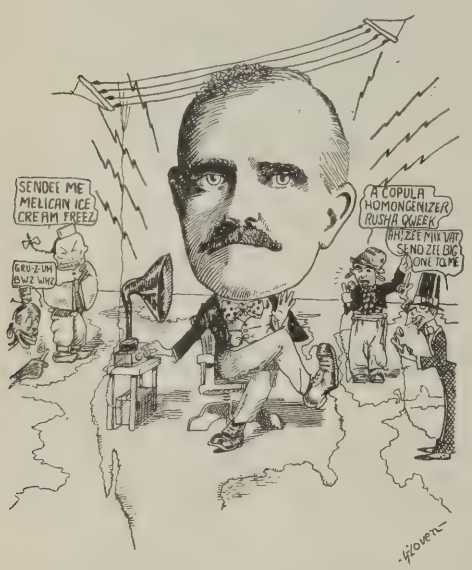
ICE CREAM MIX READY FOR FREEZING IS ON THE MARKET.

For the past five weeks a very healthy demand has been in evidence although extravagant buying such as has been experienced in the past is not present at this time. Most manufacturers and dealers that I have talked with feel very optimistic and now that the public generally is being educated and becoming more familiar with the beneficial qualities of ice cream, I venture to predict that with reasonable weather this will be a banner year for ice cream manufacturers.



Thanking you for affording this opportunity to express myself, I am,

H. A. STEVENS.

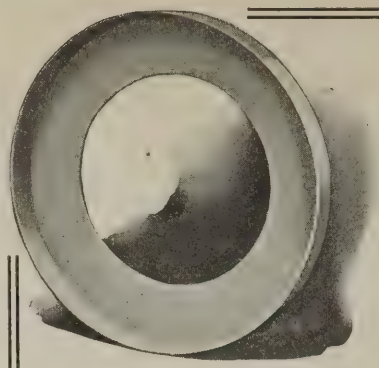
RADIO NEWS.

Our good friend R. J. Decy, with the Emery Thompson Machine and Supply Co., New York City, tells us that ice cream is becoming so international in character that some of their across seas customers can not afford to take chances with the old-fashioned method of calling their orders for machines, and now resort to the Radio Service in their efforts to expedite shipments. Mr. Decy considers this a very pronounced adaptation of that old American political adage of several decades ago that "American prestige follows the flag."



ICE CREAM POPULAR IN AUSTRALIA.

THAT the people in far away Australia do not intend to be outdone by Americans when it comes to eating ice cream is strikingly illustrated by the fact that the J. G. Cherry Company of Cedar Rapids, Iowa, has received an order from Peter's American Delicacy Company of Sidney, Australia, for four eighty quart freezers. This concern has for some time been using four Cherry Model 40 Brine Freezers and their business met with such success they decided to enlarge somewhat. In fact they are making very elaborate plans for marketing a brick ice cream which is entirely new, and for that particular purpose have also ordered a Rogers Brick Maker.

As long as the world does move will women give their husband's pipes for birthday presents and then scold them all the time for smoking the vile things.—"Dynamo."

B. L. R. Re-inforcing Tub Bottom Hoops

"For Ice Cream Tubs"

How Many "Drops" Will Your Ice Cream Tubs Stand?

Government statistics show the average life of an Ice Cream tub to be 150 to 180 "drops." Records kept in several plants where B. L. R. Hoops have been in use show that tubs so equipped will stand upwards of 500 "drops" without loosening of staves or breaking of chimes.

The weakest part of all tubs (the groove or chime) is thoroughly protected and additionally reinforced by the use of B. L. R. Hoops on the tub bottoms.

In ¼" sizes from 14½" up to 18½".
"A B. L. R. Hoop on very tub bottom."

EVANS SPEED-O-STAMPS
INDIVIDUAL ICE CREAM FAVORS
"Just Like Mother Stamping Cookies"

Evans Speed-O-Stamp is a simple device requiring no skill to operate. Just take a brick of ice cream, any flavor, cut 6, 7 or 8 slices to the quart, and stamp the required design out of each piece.

"Just like Mother stamping Cookies."

Sold only in sets of 6 designs — Heart — Shamrock — Masonic — Shrine — Kiwanis — Spade.

The Ice Cream Review:

I have your favor requesting an expression of my opinion of general conditions at present and prospects for the future. I have within the past six weeks covered practically all of the Southwest and am glad to give you the status of business in the ice cream and soft drink industry in this section as it appears to me from my experience on this trip.

Weather conditions have been very unfavorable in the entire southwest all of the year. There have been very few days that were warm and dry enough to create any demand for our products. What little favorable weather there has been has consisted of periods of such short duration that business would no more than begin to get under way when it would be checked by rain and cool spells. However, I have noticed that when a day or two of good warm weather does come the trade responds to it to a considerably greater extent than it did last year. I was actively engaged in the manufacture of ice cream last year at this time here in Texas and I keep in close touch with the same plant this year altho I am back on the road for The Warner-Jenkinson Co., with whom I have been connected for the past eleven years. I notice that this plant that I mention does a considerably better business on favorable days this year than it did last year at the same dates. I have inquired among many of my customers and they most all tell me the same thing. This leads me to believe that conditions must be better generally than they were a year ago. I hear less talk about tight money and hard times than I did last year, and also collections are easier. Current accounts are being paid fairly well, altho accounts carried over from last year, of which there are more than usual among ice cream supplymen generally, are being paid very slowly on account of the late opening of the season. Plant managers are buying very sparingly this year, it seeming to be their purpose to hold expenditures down to the minimum, this applying specially in the cases where they are carrying over indebtedness from last season, and if this policy is continued and the customary dry hot weather in this country in July and August prevails it looks as though there may be virtually a complete liquidation of old indebtedness this year, resulting in the industry getting back on its feet and re-established on a firm foundation once more. It is at present still suffering from over-inflation. Too much new equipment and too many new plants, in many instances of much greater capacity than needed, were built just before the bottom dropped out of everything. It takes time to readjust matters to fit these new conditions. A few here and there have fallen in the melee, but most of them are fighting a good fight and will pull through all right.

Prospects for the future look much more hopeful to me that they have for some months past. It looks as though there is a tendency among the trade to stabilize prices on ice cream and there is less granting of concessions such as special advertising, free ice cream, special discounts and such, being given this year than there

(Concluded from page 135)

were last. A few manufacturers who last year carried all these unbusinesslike practices to extremes went broke and are now out of business and this seems to have proved an object lesson to the rest of them, and to have been the means of bringing back the use of sane business methods. It also appears that the fountain men have begun to see the light and are going to get their prices back down to a normal basis. One of the principal causes for loss of volume last year was the hold-up wartime prices maintained by the fountains. But they have at last begun to sense the fact that they have not gained by their high prices as they have driven their business away. The people have in a manner readjusted themselves to present financial conditions and they are not so much alarmed at the future as they were and I believe that when the hot dry weather of summer and fall, that always comes to the Southwest, sets in, and with the lowered prices at the retailers with no tax to pay, and the people in general in a more liberal spending mood, good crops in prospect and being gathered and marketed, business will show a regular old time revival and get back to normal and everyone will wear a regular old-pre-war smile.

J. H. ECKEL,
Warner-Jenkinson Co., St. Louis.

* * *

Sulphur Springs, Texas.

Gentlemen: The business has been very slow starting this spring on account of excessive rains and floods in our state, but I look for a grand rush now real soon as the rains have ceased to a great extent and everything points to better times ahead for those who have sat tight in the boat this far.

Congratulations on the splendid paper you are giving us and trust your efforts shall not be in vain.

FRANK B. WESTER.

ICE CREAM IN POWDERED FORM.

A very interesting little booklet has been received in this office treating of a new development in the ice cream industry. This booklet tells of the merits of Washburn's Powdered Mix, and the advantages of its use in the manufacture of ice cream. It is compiled in the form of a questionnaire, and answers every question that might arise regarding the use of this powdered mix—what it is, how it is made and how to use it.

Use of this mix seems to reduce the labor of ice cream making to a minimum, as all that it is necessary to do is to dissolve it in water, age it, and freeze as usual. It has already been pasteurized and homogenized.

A copy of this booklet may be obtained by writing to the International Dry Milk Company, Minneapolis, Minn. Any ice cream manufacturer would find the information contained therein interesting.

DISSOLUTION OF PARTNERSHIP.

The firm or partnership of Sinclair Brothers, Galesburg, Illinois, has been dissolved through the retirement of Evan B. Sinclair. Mr. R. G. Sinclair is now sole owner of the business, which will henceforth be conducted under his name.

Mr. Sinclair will do a jobbing business in fruit syrups, crushed fruits, extracts and cones, and will manufacture ice cream, ices and soft drinks.

Time Required to Freeze, Why it Varies?

THERE are certainly a great many causes for variation of time required in freezing and developing desired overrun in ice cream. Chief among these, perhaps, is the condition of the mix as regards solids, acidity, age, and temperature, or perhaps the temperature and pressure of the brine, but when a manufacturer writes in asking, "Mix being uniform as to solids, acidity, age and temperature, the volume and temperature of brine being the same, why does time required to freeze and obtain desired overrun frequently vary?" we began to wonder what else might cause it.

A large part of the rapid progress of the ice cream business is due to the supplymen and manufacturers. The ice cream supplymen are universally known as the most friendly business competitors in the world, but they will have to step some if they are going to keep ahead of the ice cream manufacturers.

The variety of hitherto unthought-of little causes which manufacturers have discovered, and very pleasantly, even delightedly, forwarded to us for the benefit of the trade, is surprising. Here they are:

Insulation on Inside of Freezer.

Reply:—There are so many reasons why "Mix being uniform as to solids, acidity, age and temperature, the volume and temperature of brine being the same" should vary in time required to freeze and the amount of overrun obtained that we could almost write a book on the subject. However, we will endeavor to give our idea of some of the main reasons for this variance.

It is obvious that all conditions being the same—the results must be the same. If some conditions are the same then differences in result must find their causes in those conditions which are not the same. Therefore, under your proposition we can eliminate from consideration the amount and condition of solids, state of acidity, the age, the degree of temperature, the volume and temperature of the brine. When any of those things vary, you would have at once a good reason for variance in results obtained, but as our proposition shows no variance in those things we must look for causes of variance elsewhere.

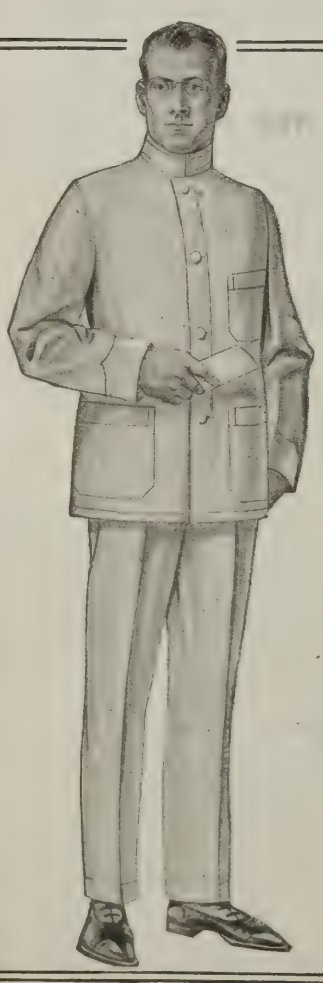
One of the first things we would naturally think about is the condition of the paddles in the freezing machine. If these paddles are dull, they will not scrape clean the inside of the freezer, so that a thin film of mixture is left on the walls of the freezing machine acting as an insulation, consequently, retarding the freezing effects of the brine. This will result in the slowing up of the freezing and of course affects the overrun. The paddle blades should always be in first class and sharp condition.

Another primary cause for variance occurs if the brine is turned on before the mixture is run into the machine for freezing. When the brine is turned on and the freezer is empty a coating of frost will accumulate on the inside walls of the freezer and then will act practically in the same way that the film left by dull paddles on the walls.

Another cause is due to leaving drops of water inside the freezing machine after it has been washed out. Then if the brine is turned on before the mixture runs in, little lumps of ice form on the inside walls of the freezing machine to prevent the paddles from thoroughly scraping the walls and the film will therefore accumulate on the walls acting as insulation against the freezing effect of the brine.

These are some of the major causes, and most frequent causes for variance in time required to freeze and in the amount of overrun obtained.

* * *



Human Factor Responsible.

Reply:—We would say that if everything is as stated, there should be no variation in time of freezing, as every mechanical detail is identical, but we grant there is a difference, and it is at this point that the human factor enters, using an Overrun Tester, and a Thomas Batch Measure is the best aid that we know of, to give uniform results, and in freezing, our procedure is as follows:

We use as cold a brine as possible; say zero, with from fifteen or twenty pounds of brine pressure; we never pull on the first swell, but freeze back, throw off the brine, and beat the overrun. We wish to take on a thirty-eight total solid, and we take eighty-five per cent and have no trouble in making a uniform product, and as to keeping qualities in dealers' cabinets.

It is very simple to obtain one hundred and twenty per cent overrun, but we find that this is not what the consuming public want.

To sum up, a competent operator is essential on the freezers, and one who is trained to work on the particular make in use. You state that the temperature is uniform, but that is impossible, as there is bound to be a constant fluctuation of from five to six degrees as the constant addition of mix at, say forty to forty-eight degrees has its effect on brine temperature. The amount of mix admitted to the freezer may vary if old style hoppers are used in freezers. This variation may be from four and one-half gallons to six and one-half gallons of mix, and this may be the cause of trouble, and is a point with which we formerly had difficulty, but since installing the Thomas Batch Measure, this condition has been corrected automatically.

Blades Must Scrape Inside of Freezer.

We are wondering if this party has looked into his freezers to note if the blades are coming in contact with the barrel of the freezer at all points, also, are the blades sharp? If not this will make a difference in the time required to freeze.

We find that when we freeze at a temperature of 34 to 36 degrees, the freezing takes place very quickly but it requires considerable time after brine is shut off to get the proper overrun where a temperature of 42 to 43 degrees takes more time to freeze but not long to whip after brine is shut off. Also the lower temperature does not make the same body that the higher temperature does. When frozen at low temperature the finished product becomes light and fluffy and has not the firmness that the higher temperature brings forth.

Temperatures and aging the mix are mighty important factors as well as the acidity, and must be watched very carefully if a uniform product is desired.

Due to Difference in Casein.

Reply:—We have noted this variation of freezing time, under what appeared to be identical conditions, and have given the problem some thought and study.

Granted, that the mix is uniform as to fat, solids, acidity, age and temperature, and that the temperature and volume of the brine are the same. And granted that the same formula, and in general, the same types of dairy products were used in the production of the mix; this variation in the time required to freeze and to obtain the desired overrun is probably due to the condition of the casein in the mix.

Acidity, itself, is not necessarily the indication of a well ripened mix. Two batches of mix, each having the same acidity and each having been aged the same length of time under the same conditions, may still show variations in the condition of the casein.

We have found that two or three batches of mix, run at the same time under the same conditions, will show a marked difference in overrun, even when the acidity is the same. Oftentimes the highest acid tank will give a lower overrun, and if that tank is aged another 24 hours there will often be a noticeable increase in the overrun at the second freezing.

We have found that the best method, is to strive for a low acid content at the Pasteurizers, and then to allow sufficient time in the holding tanks to secure the necessary ripening and conditioning of the mix. This method gives us a finished mix with an acidity of under 0.32 per cent. In spite of this seeming low acidity we have no trouble obtaining the necessary overrun.

A short time ago we made a series of experiments with mix in which the acidity had been artificially increased by from 0.1 to 0.2 per cent. This experiment further strengthened our belief that acidity itself, has little effect upon the question of overrun.

The best method of measuring the condition of the casein, aside from a microscopic examination; is by means of a viscosimeter, which measures the force required to produce a definite relative movement of the fluid particles within a mix, in a given time.

* * *

Reply:—I have noted variations in the time required to freeze ice cream. I have noted the variation of three to five batches in an hour.

The rate of freezing is influenced by the temperature of the brine, its rate of flow and density, by the temperature of the mix when put into the freezer and the materials in the mix and the speed at which the freezer is driven.

There are several factors which effect the length of time it takes to secure the desired swell. The temperature of the mix while whipping should be 27 to 28 degrees and it is very important. The size of the fat globules in the cream and the pasteurization of the milk, cream or mix are very important. The correct adjustment of the valves in the homogenizer or emulsor is important and is frequently the cause of the variation in the period of freezing, as it effects the size of the fat globules.

* * *

Many of the replies given in full were supplemented by similar letters from other manufacturers all over the country. The subject of sharp scrappers or dashers in the freezer came in for the greatest share of the comment; several manufacturers seem to have had trouble with changing lengths of time required for freezing and traced it to the coated inner wall of the freezer that resulted from dull scrapers. A few manufacturers using belt driven types of machines apparently have had trouble af this kind because of the belt slipping. Two of the replies suggested that there is a possibility of the quantity of the mix being uniform. One manufacturer says that if the temperature and humidity of the air is always the same, there will be no difference in the freezing time, and another advises that the freezer may be loaded over capacity, thereby keeping out the necessary air for the desired overrun. "It just happens that way and we know it. Though being decidedly ignorant of the real cause, we have summed it up in one word—viscosity," jokingly says one manufacturer who has evidently had this trouble but got rid of it, and we hope that all of the manufacturers having this trouble will soon be able to laugh at it.

It Is Better because it is more convenient, more efficient, more reliable and more simple. That is why Chicago ice cream men have adopted this machine. More of R&D brick cutting machines are now used in Chicago

Than All Others Combined

One user *averages* 3500 bricks daily in three hours.

The R&D Better Brick Cutter Costs Less, Too. It is fully guaranteed, and sent on trial. *Write for particulars.*

THE ICE CREAM SITUATION IN MICHIGAN.

By W. G. Finch, Grand Rapids, Michigan.

The remarkable development of the ice cream industry in Michigan is rather amazing, even to those of us who have been in more or less close touch with the situation.

Not so many years ago the manufacture of ice cream was regarded by the average layman as a back-room industry, at which a few benighted caterers eked out a more or less uncertain living. Naturally, it surprises a person who had that view of the situation when he at-

tempts to realize the hundreds of thousands of dollars represented by the equipment and buildings in our present day ice cream factories.

In practically every city in the state the past two years have seen new factories built and old factories expanded, this in spite of the fact that the general business depression has brought some of our leading industries to a practical standstill.

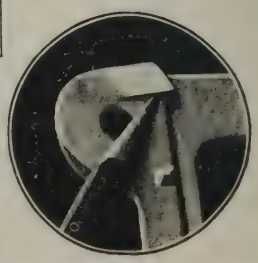
It is claimed that prohibition made possible the development of the ice cream industry. It is also argued that the man who spent his pay-roll with his foot on a brass rail, would not make much of an ice cream parlor lizard. Perhaps not, but in the majority of cases it is his youngsters that have the nickels and dimes that used to be spent for the frothy substance that made Milwaukee famous.

There is no denying the fact that prohibition has had its effect on the ice cream manufacturers. Let us glance over the state and see what has happened in the last two years.

Kelly of Grand Rapids came out of the alley and blossomed out with a large up-to-date factory. The Arctic of Detroit have built a large modern factory in Grand Rapids. Hoekstra of this city has doubled his plant capacity, while the Wexford Ice Cream Company have plans under way for a $30,000 modern factory. Freeman Dairy of Flint have built or acquired factories at Jackson, Bay City, Cadillac and Saginaw. The American Ice Cream Company and Fleming Ice Cream Company of Jackson have doubled their output. M. & B. Ice Cream Company of Saginaw has tripled its output. Francke & Sons, of the same city, have plans well under way for a plant three times the size of the present one. The Blue Ribbon Ice Cream Company of Kalamazoo started in a back yard and in six months were compelled to move into a modern and well equipped factory, while the Kalamazoo Ice Cream Company started off April 1st of this year and reports good business.

Hanselman Candy Company and Piper Ice Cream Company of Kalamazoo, report increased business. At Port Huron the Wilson Ice Cream Company's growth has been phenomenal, and A. B. Carlyle has just completed one of the finest ice cream factories in the United States. The Connor Ice Cream Company of Owosso have factories at Bad Axe, Lansing and Ann Arbor.

The plants enumerated are only a few of the ones that are making rapid strides. In view of the fact that the factories are increasing in number, and the older factories report increased business, one is forced to the conclusion that more people are eating ice cream, yet when one looks around and makes an estimate of the volume consumed per capita it is evident that the consumtion of ice cream is not one-tenth of what it will be within the next five years.



The increasing number of factories have caused considerable discussion regarding a price cutting war to eliminate competitors. It is my opinion that competition will never be eliminated by price cutting. I have observed that the price cutter usually puts out an inferior

Why TAG-BAKS
Bring Your Tubs Back

is best explained by the special patented construction of the TAG-BAK itself and by those who have used them.

The projection on the back is the little device that lets the tag slip in easily and prevents the tag from coming out again. Only a sharp pointed tool; deliberately inserted in the tag can remove it from the TAG-BAK System.

Learn more about the TAG-BAK System thru one of our circulars—write

TAG-BAK, 183 Ogden Ave., Milwaukee, Wis.

grade of cream and gives service that cannot be depended upon, and I believe that the factory that strives for quality and service will get the business, regardless of the manufacturer who puts out an inferior product at a lower price.

It was formerly the practice of the ice cream manufacturers to depend on an outside market for their condensed milk and sweet cream. Recently, they have realized that in order to put out an A-1 product, they must have control of all the milk ingredients that go into their product, consequently, the majority of the larger factories are equpped with milk condensaries and receiving stations, where they get their raw material direct from the farmer.

A review of the situation would convince the most sceptical that the ice cream industry in Michigan has come to stay, although at present it is only in the beginning.

Haines-Carpenter Dairy Products Company, St. Louis, Mo.
OTIS B. WITTE, Secretary
N. A. Kennedy Supply Company, Oklahoma City, Okla.

EDMOND CREAMERY AND ICE CREAM COMPANY ENJOYING BIG SUCCESS.

The accompanying photograph shows the plant and working force of the Edmond Creamery and Ice Cream Company at Edmond, Oklahoma. The tall gentleman standing with the hat in his hand is Mr. E. J. Sheldon, the proprietor, and the tall, dark haired man second from the left is Mr. J. H. Parkhurst, manager of the creamery.

In a letter from C. R. Hauk in which he tells about this plant, he says:

The working force of the Edmond Creamery and Ice Cream Co.

"Mr Sheldon has built up this successful business in only one and one-half years. This causes the writer to wonder how far this good hustler, with the valuable assistance of Mr. J. H. Parkhurst, his creamery manager, who has had about 10 years' experience, will extend his business and wonderful influence in the next five years. Time alone can tell, and may the writer be on the ground to be the first one to shake them by the hand and congratulate them on their big successes. The world admires this type of business man. More strength to them!"

Ottawa, Kansas.

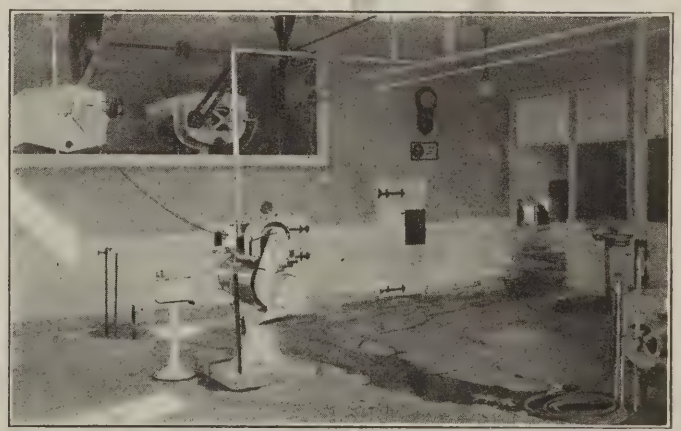
The outlook for the ice cream season of 1922, in this territory looks good. We are in touch with a large number of ice cream factories on account of furnishing them with raw material, and the demand this spring, while it has been a very wet spring, is far better than the same time last year.

Another thing the factories all seem to realize that it pays to make good ice cream, and there has been wonderful improvement along that line in the territory, plants are better equipped, better machinery is being installed, and better material is being put into the ice cream. The fellow that has not followed the above plan is losing his business, and having a very hard time to pay his bills, if he has not already fallen by the wayside.

We believe that it pays us to have the other fellow make good ice cream, as to our idea, the industry must rise or fall together, and if the other fellow makes poor ice cream, he is helping to make some consumer dislike the national dish that we all make our living out of.

J. H. BENNETT.

* * *



I have just returned from a four months' trip from the Southern California Coast to Canada. Conditions in the ice cream business and business in general are exceptionally good, but prices on ice cream rather low. The ice cream manufacturers will be satisfied when the good hot ice cream weather gets here—that's all they are waiting for to make this a banner year.

J. S. MAY,
Blanke-Baer Extract & Preserving Co.

* * *

SOME FELLOWS DO HAVE ALL THE LUCK.

It always seems to be the good fortune of our enterprising friend, C. R. Hauk, to come in contact with live wire concerns that are actually making things hum instead of waiting for business to come to them. Makes us feel that the old "Birds of a Feather" adage means

Freezing Room of Lindsey Ice Cream Company's plant.

something besides the title of a popular song.

The latest firm of this kind that Mr. Hauk tells us about is the Lindsey Ice Cream Company of Okmulgee, Okla. His letter follows:

To the Editor of The Ice Cream Review:

I am enclosing some pictures of the interior of the Lindsey Ice Cream Company's plant at Okmulgee, Oklahoma. Mr. Ernest L. Lindsey is President and General Manager. This young man of 33 years had had ten years' experience in this great industry, and today his plant at Okmulgee stands out as an object lesson to us all of what hard work coupled with honest and fair methods will accomplish.

Mr. Lindsey is now enjoying a big increase in volume of package cream. He believes in holding up the quality of his cream, and placing it before the public in the neatest of packages. He is also an ardent advocate of ADVERTISING.

At the Okmulgee plant Mr. Lindsey is very ably assisted by Mr. Arthur Faubion, who has entire charge of the ice cream room. Mr. Faubion has put in 17 years' of hard work and study in order to bring himself up to the high standard of efficiency he now enjoys. This young man started in the ice cream business at Flora, Ill., in the summer of 1904. A good record, Mr. Faubion. Keep it up.

The Lindsey Company also has a plant at Chickasha,

Refrigeration machinery and homogenizer in the plant of the Lindsey Ice Cream Company.

Okla., which is managed by Daddy Lindsey and W. L. Lindsey, a brother of Ernst Lindsey. This brother is also a very close student of the ice cream business. Well can Daddy Lindsey be proud of these hustling boys.

Notice the smile on the face of Ernest Lindsey. A fine, new BIG son arrived at his home several days ago. Mother and son are doing fine. The boy wanted ice cream right off the bat, and of course Mother Lindsey would not let him have it. Then, boys, you should have heard the Wolf-Hound yell that he gave! The entire Hauk family join in congratulations to the father and mother, and may the little lad in the years to come prosper through the enviable heritage of character bestowed upon him by his parents.

C. R. HAUK.

There is one point where we feel sure Mr. Hauk or somebody slipped up. We looked all over these pictures with a high powered microscope and failed to locate the smile on Mr. Lindsey's face. The only face in evidence was the one on the clock. We're sorry to have missed it, too, because he certainly had grounds for turning out something pretty nifty in the way of a smile. We hope our readers have better luck. If not, blame Mr. Hauk, not us. We did the best we could.

SODA MENUS

Effective Advertising For Ice Cream Manufacturers

OUR menus are popular among ice cream manufacturers who give them to druggists and confectioners with the manufacturer's trade-mark or advertising slogan printed on them. This is a sure and inexpensive means of advertising the ice cream manufacturer as the menus come to the attention of the customers of the retailer.

These menus are **especially** for the Soda Fountain. They are not hotel menus nor restaurant menus, but are printed and embossed in colors on the highest grade of stock and reproduced from original drawings for the use of Soda Fountains exclusively.

Samples Free on Request.

THE ALLIS PRESS **Kansas City, Mo.**

UNFAIR COMPETITION CONDEMNED.

One of the most despicable business practices on the part of unscrupulous manufacturers is that of embodying some patented feature of a competitor's product in their own. Though there is stringent legislation against this, the idea seems to be to "get their while the getting is good," and rely upon shrewd legal guidance to get out of it.

In the Ice Cream Supply Men's Code of Ethics, under the section entitled, "Unfair Practice of Competitor Against Competitor," paragraphs 9 and 10, deal with practices of this nature that are prohibited. These paragraphs read as follows:

9. False claims to patents or misrepresentations of the scope of patents.

10. Simulating in one's own product the trade mark, trade name, slogans, cartons, advertising matter or appearance of a competitor's product.

Legal prosecution of violators of the laws pertaining to unauthorized use of a patented article is very severe, and members of the ice cream trade are warned against unwittingly becoming a party to such unfair competition.

* * *

Cedar Rapids, Iowa.

We are pleased to report present conditions in the various branches of the dairy industry as excellent, with every indication that they will continue so. Although the ice cream season has been late in arriving in many sections of the country, the manufacturers are optimistic.

W. S. HAMILTON.

The Ice Cream Review:

The general conditions of the ice cream business are fine at present; the future looks very good and the trade looks for the best season they ever had. We have had a great deal of cold weather and rain in this section and, with all that, I do not think the trade has any kick.

Our can sales have been about 50% over last year and at the present time can take no orders until after the Fourth of July; this condition is a good indication of a good season.

D. H. GUNDRUM,
Keiner Williams Stamping Co.

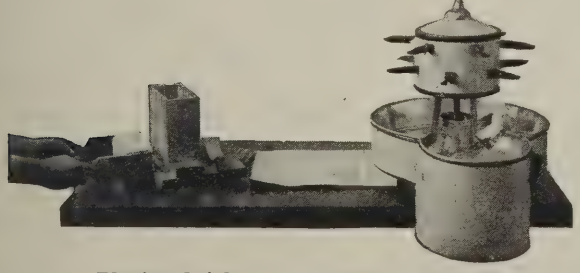
TWO NEW BOOKLETS OF INTEREST TO THE TRADE.

The problems of the milk dealer and the ice cream manufacturer, relative to transporting and storing of dairy products are discussed in two interesting and complete booklets published by the Elyria Enameled Products Co., Elyria, Ohio, which have just come from the press. Truck and railroad transportation—two big problems in the dairy business—are covered, and showing Elyria equipment specially designed to meet the requirements of any situation. Horizontal storage tanks are featured in the second booklet. These booklets will be sent free upon request.

SOMETHING NEW IN THE ICE CREAM BAR FIELD.

One of the most interesting developments in the ice cream industry recently, particularly in the chocolate coated ice cream bar field, is the conception of an idea by a five year old boy for the elimination of mussiness in eating the bars by putting them on a stick.

This boy is little Jackie Morgan of Everett, Washington, whose picture accompanies this article. His father's story of how the idea was developed follows:

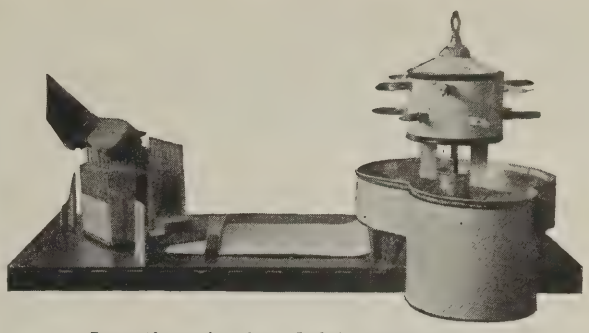


JACKIE MORGAN'S IDEA. NO FUSS—NO MUSS.

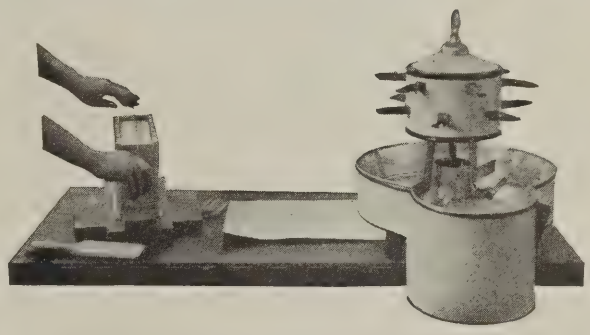
"The writer, W. C. Morgan, owns the Peerless Ice Cream Store, Everett, Washington, and the Cave, Inc., Tacoma, Mr. Walter H. Kuhnle is manager of the Peerless Dairy Store and Mr. Virgil Van Patten is my ice cream and candy maker.

"Like every other ice cream manufacturer, when the chocolate coated ice cream bars came out we started to make them. We made the Nut Roll sandwiches and bars. One feature that many people find disagreeable about the bars is that not only children, but grown people too are likely to get more or less mussed up when they eat them.

"My little boy five years old had so much trouble in this respect that his mother and I refused to let him have bars when he was dressed up. So one day when he wanted one very badly he told his mother to have daddy put a stick in it and he wouldn't get mussed up. For a joke I did it, and it worked so well we tried it out.

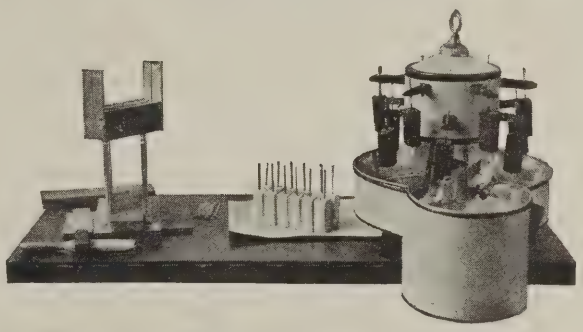


"We had a little trouble at first making the stick stay in the bar. But Mr. Van Patten overcame that trouble, and now days after Jackie Morgan gave us the idea of putting a stick in his ice cream bar, we have manufactured and sold thirty machines, and wherever the machines are in use the bar business has increased from 30 to 300 per cent over the old way of selling the bars. When the Public see them made they want them. One wholesale manufacturer took ten machines, and is renting them to his customers.



Placing brick of ice cream on block.

"We have applied for a patent on the method of serving ice cream bars and on the machine for dipping them. We have not yet taken up the matter of putting them on the market on a large scale."



The four illustrations will show the operation of this machine. It is surprisingly simple and efficient. Its unique advantages as an advertising feature may be readily seen. It is claimed that it will convert the ice cream from bricks to chocolate coated ice cream bars in one and one half minutes in show windows or at a soda fountain, without having the hands come in contact with the ice cream or bars during the entire process of making or eating. It appears to be a very sanitary way of making and serving the bars.

Inserting pins into brick of ice cream.

Cutting brick of ice cream into bars.

Brick of ice cream dipped and all ready to sell.

ICE CREAM MANUFACTURER INJURED IN ACCIDENT.

Mr. W. M. Sidebottom, Sr., Secretary and Treasurer of the Sidebottom Ice Cream Company, Nashville, Tenn., and president of the Tennessee Association of Ice Cream Manufacturers, sustained serious injuries recently when the automobile in which he was riding met with an accident. His left leg was broken below the knee, his right forearm was broken in two places, his left wrist was torn and dislocated and his head was badly cut.

After two weeks at St. Thomas' Hospital he was removed to his home still in a helpless condition. However, you can't keep a good man down, and Mr. Sidebottom promises to be at the big doings at Cleveland in October with bells on.

Mr. Sidebottom dictated a letter to The Ice cream Review in which he asked us to let the boys all over the country know that he was mighty glad to get their messages and flowers, and that he will meet them in Cleveland.

WASHINGTON—MAINE

News From Far and Near

CALIFORNIA—FLORIDA

Hope, Ark.—The plant of the Holman Ice Cream Company was recently damaged by an explosion.

Little Rock, Ark.—The Package Ice Cream Company of Searcy has opened a plant here. The company is owned by Ben and R. E. Grisham, formerly of Searcy. They manufacture ice cream for retail trade, selling it only in pints and quarts. The company formerly operated a wholesale ice cream plant at Searcy.

Siloam Springs, Ark.—The Gay-Ola Bottling & Ice Cream Co., D. B. Jackson, proprietor, is now open and in full operation in its new building.

The company is handling a full line of soda waters, and is also manufacturing ice creams, sherbets, ices, fruit creams, fancy brick cream and any fancy cream made to order.

The plant is equipped with the latest machinery, including a pasteurizer for pasteurizing milk and cream; two modern bottling machines with a capacity of 400 cases a day; sanitary bottle washer; the latest improved ice cream freezer with a capacity of 400 gallons of cream a day, and a large hardening room.

Mr. Jackson, who is an experienced bottler and ice cream manufacturer, is rapidly building up a local and wholesale business here and in the nearby towns.

Nogales, Ariz.—An ice cream factory is to be opened here by B. Y. Harris.

Bakersfield, Ca.—The Meadowland Co-operative Creamery has spent $10,000 on complete equipment for an ice cream plant. R. H. Nelson, manager of the company, announces that owing to public demand his company decided to make this move.

A wholesale department will be maintained and a special residence delivery service is to be instituted. All flavors will be found on the list and Nelson states that fancy creams will be made to supply orders for social affairs, bricks and fancy shapes being featured. The plant has just begun operations.

San Francisco, Cal.—The National Ice Cream Company of this city is planning opening a branch plant at Vallejo, Cal.

Marysville, Cal.—One of the finest and most modern ice cream factories and parlors in northern California will be located in Marysville when renovations planned by the Grand Royal Ice Cream Company are complete. According to the plans of Vernon A. Van Horn, manager of the concern, a complete new factory will be built and new machinery installed, and every facility for the manufacture and storage of ice cream will be provided.

Kankakee, Ill.—The Ideal Candy Company is installing a complete ice cream plant. Along with other equipment necessary for a fine modern plant, they will install two 300 gallon Glascote tanks, a 100 gallon Progress homogenizer, a double section cooler, and a 50 quart Progress horizontal freezer.

Rockford, Ill.—The Oak Brand Ice Cream Company opened for business here recently. Russell Smith has charge of the plant.

Auburn, Ind.—The DeKalb Ice Cream Company has been organized here for the manufacture of ice cream and general products. The new firm is capitalized at $32,000.

Gypsy, Ind.—The new ice cream factory which is operated by Ney Brickell, is ready to receive orders for ice cream.

Lebanon, Ind.—George Eden's new milk station is completed and has begun operations.

Mr. Eden, in addition to the milk business, will also handle ice cream. His plant will be a substation for the Lafayette Ice Cream Co., and distribution to local dealers will be made from this substation. Mr. Eden has installed a brine tank of 100 gallons capacity and this will be sufficient to take care of the local ice cream supply.

Humboldt, Ia.—During the past week the Humboldt Creamery Company have installed several pieces of up-to-date machinery for the making of the very best ice cream. Their business in this line had so outgrown the old plant that the change became a necessity.

Maqucketa, Ia.—Kirchhoff Brothers have completed their ice cream plant and have already been making ice cream for a few weeks. The plant is modern in every respect and has a capacity of 400 gallons per day.

Pleasantville, Ia.—O. H. Bare has arranged to manufacture his own ice cream this season. He has a complete factory, electrically equipped, and is prepared to produce as good a product as can be bought anywhere.

Waterloo, Ia.—The Sanitary Dairy was recently incorporated here with capital stock of $60,000. The firm will manufacture dairy products, including ice cream. The officers and directors are: N. P. Sorenson, president; William E. O'Neill, secretary, and I. J. Gaman, treasurer.

Downs, Kans.—J. F. Bergier purchased a building here some time ago, and he has recently began to remodel it for a first-class creamery and ice cream plant. A 20-foot addition will also be built on the rear of the old building.

Downs, Kans.—Another wholesale ice cream and butter factory will be open for business in Downs soon, with Lieth Bergier in charge.

Lincoln, Kans.—Lincoln is to have an ice cream factory and it is proposed to begin operations at once. The Hawkins Ice Cream Co., of Ellsworth, is promoting the project.

Osage, Kans.—The Osage City Creamery opened for business here recently, making butter, ice cream, and ice. Considerable remodeling has been done and much more is yet to be done. A brine refrigeration system and ice plant has been installed.

Wichita, Kans.—The Zipp Butter and Ice Cream Company has recently equipped its plant to care for one-third more capacity than last year, says President C. R. Swisher. Manager C. J. Fraipont stated tnat two more trucks have been added to the company's service, and the machinery and factory have been repainted. More men were also taken on.

Cumberland, Md.—The Spealman Ice Cream Company was recently incorporated here with capital stock of $50,000. S. Edward Spealman, Hugh P. Markwood, and Geo. R. Hughes are the incorporators.

Battle Creek, Mich.—The Fields-Myers Ice Cream Company is just being organized for business, and expects to have their plant in operation by June 15th. N. I. Fields and J. W. Myers are the organizers of this company.

Elkhart, Mich.—The Furnas Ice Cream Company is erecting a branch plant here.

Adrian, Mich.—The Purity Ice Cream Company has begun operations in its new plant.

Brashear, Mo.—Scott Brothers now have their candy and ice cream factory in operation and expect to do a wholesale and retail business.

Marshall, Mo.—Laying the concrete floor is all that remains to complete the Missouri Ice Cream Association building. When that is finished, the building will be ready for installation of the four cars of machinery which are already here. Unless there is some unexpected delay the company expects to be operating soon.

Tom Rumans and W. A. Sparks are promoters of the business.

Sedalia, Mo.—J. J. Weber, president of the Weber Ice Cream Company, with plants located at Jefferson City, Moberly and Sedalia, is moving from Jefferson City to Sedalia.

Beatrice, Nebr.—T. L. Case recently opened an ice cream factory here. The plant has a capacity of 30 gallons of ice cream an hour.

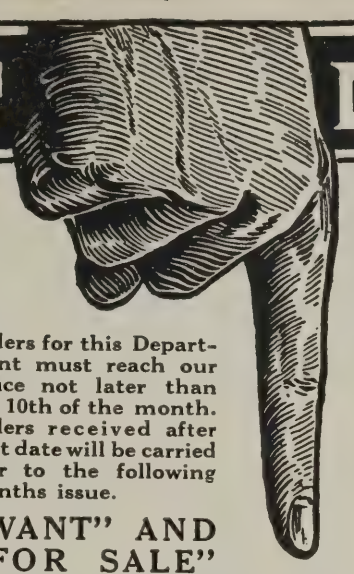
Freemont, Nebr.—The Golden Rod Creamery Company has installed an ice cream plant in connection with the creamery.

Norfolk, Nebr.—The plant of the Graham Ice Cream Company recently began operations with their new equipment. Manager R. A. Grim invited the general public to visit the plant in order that they might see the improvements.

Syracuse, N. Y.—Comrades in service during the World War, Major Frank C. Love, Capt. E. M. McCabe and Lieut. Edward E. Hawkins have formed a partnership, and will conduct a business known as the Cloverland Ice Cream Company, in Syracuse.

Preliminary arrangements have been made. The men on trips of inspection have observed the most scientific plants of which ice cream is the product in the East. Efforts have been made to bring a college instructor from Cornell as chief of production.

A plant has been built. It is a model institution with glass front, open at all times to view from the street. The plant is about to begin operations.



Burlington, N. C.—The Almanace Co-operative Creamery Company was recently organized here for the purpose of manufacturing butter, ice cream, and other dairy products. The officers of the organization are: Dr. J. P. Spoon, president; C. G. Sellars, vice president; and E. L. Henderson, secretary.

Fairmont, N. D.—The Metropolitan Milk Company of Minneapolis, Minn., has located in Fairmont and begun to manufacture ice cream, and will install machinery for a creamery, which is being pushed as rapidly as possible.

Williston, N. D.—The new plant of the Williston Creamery and Produce Company, replacing the one that was

(Concluded on page 148)

The Bennett Creamery Company, Ottawa, Kans. 8-22

FOR SALE—One Creasy No. 50-Y ice crusher, capacity claimed 25 tons per hour; belt driven; price $125.00 F. O. B. Milwaukee. This crusher is in good condition and has seen two years actual service. The Geo. C. Mansfield Co., Milwaukee. 6-22

FOR SALE—One Meyer icing truck body. Further information furnished on request. Elmira Ice Cream Co., Elmira, N. Y. 6-22

FOR SALE—1 vertical open top, blue enamel tank, 47 in. O. D. x 50 in. high, 375 gal. $300.00 each. 1 horizontal blue enamel 6 ft. 9 in. O. D. x 6 ft. long, 2-30 inch rings, 1,342 gal., $350.00. 4 vertical closed top 6 ft. 0 in. O. D. x 7 ft. 6 in. high, 2-36 inch rings, 1,575 gallons capacity, $400.00 each. Chas. S. Jacobwitz, Buffalo, N. Y. 5-22tf.

FOR SALE — One De Laval Emulsor, three 40 quart Continental direct expansion amonia freezers, motor driven. One 40 quart Miller, one 40 quart Progress brine freezers, belt driven. One 10 ton, one 25 ton refrigeration Continental Amonia compressors, one 10 ton Sterling compressor — also lot of milk, brine and water pumps, 15 motors, 2 to 50 h. p. 2 phase, 60 cycle, 220 volts. Attractive prices—write us. M-B Ise Kream Co., Dallas, Texas. 6-22

FOR SALE—First grade unsalted butter. Get our prices. Golden Belt Cry. & Ice Co., Hays, Kansas. 9-22

FOR SALE—The best equipped small creamery and ice cream plant in the best location in the South. Address R-276, Ice Cream Review. 5-22

FOR SALE — Creamery Package ice cream brick mould releaser. Good as new. Used only one year. Price $125.00 F. O. B. Milwaukee, Wis. Reason for selling, installed Mojonnier automatic brick filler. The Geo. C. Mansfield Co., Milwaukee, Wis. 6-22

FOR SALE—One Gauline homogenizer in good condition. Capacity, 200 gallons per hour. Will sell for $500.00. The Fairmont Creamery Co., Omaha, Nebr. 6-22

FOR SALE—One Progress upright and one Emery Thompson upright brine freezers, capacity ten gallons each. Cheap for cash. Hoefler Ice Cream Co., Box 162, Buffalo, N. Y. 6-22

FOR SALE—One 6 to 8 ton Saver refrigerating machine and high side, including 15 H. P., 220 volt, 3 phase, 60 cycle motor, for the sum of $800.00. Erecting Engineers Co., 9 So. Clinton St., Chicago, Illinois. 6-22

FOR SALE—Rebuilt Miller Globe 40 qt. freezer, good as new, belt driven. Address: Dewart Milk Products Co., Inc., Dewart, Pa. 6-22

SOLD THE FREEZER

The Ice Cream Review
Milwaukee, Wis.
Gentlemen:

Please discontinue our ad in your publication as we have sold the Ice Cream Freezers you advertised for us.

Very truly yours,
STEEL-DE SOTO ICE CREAM CO.
Minneapolis, Minn.

WANTED—Wisconsin State agency for creamery, cheese factory and ice cream specialties by party with wide rcquaintance in the state.
References. Address
R-290 Ice Cream Review
6-22

FOR SALE — ICE MACHINES — SEVERAL SMALL SIZES taken in on larger ones. A No. 1 order. About half price. Will erect and guarantee. **H. A. BORN CO.,** 326 River Street, Chicago. 7-22

FOR SALE—1 1-ton IXL compressor with overhead valves condenser and receiver, belt drive with 3 h. p.—G. E. motor $300.00. 1 1-ton Brunswick ammonia compressor with condenser and receiver, $250.00. 1 80-gal. copper cooker with agitator, $200.00. Address: Lawrence Ice Cream Co., Chicago, Ill. 6-22

FOR SALE—Miller 80-qt. motor drive freezer and twelve 40-qt. freezers, various makes, both belt and motor drive—cheap. Cans, tubs, cabinets, vats, Manning can washers, ice breakers. Send for complete list of bargains in equipment. Philadelphia Retinning Co., North Philadelphia, Pa. 6-22

If you want help for your factory, the quickest and cheapest way to locate same is through The Ice Cream Review Want Department.

FOR SALE—Advance Special. Four 40 quart new and highly efficient motor-driven freezers. Simple, economical and possessing all the advantages found in higher priced machines. Very low price for quick sale. The Advance Dairy Mch'y Co., Frank Tyson, Gen. Mgr., 608 Cherry Ave., N. E., Canton, Ohio. 7-22

FOR SALE—Four foot copper condensing outfit complete in first class condition, guaranteed in every respect. Address: R-291, Ice Cream Review. 6-22

WANTED TO BUY

WANTED TO BUY—Small homogenizer, batch mixer and belt drive brine freezer. Must be reasonable. Write D. O. Bricker, Box 295, Fernie, B. C., Canada. 6-22

NEWS FROM FAR AND NEAR.

(Continued from page 146)

burned last October, opened recently. The new equipment, modern throughout, includes an artificial refrigerating system and complete facilities for the manufacture and storage of ice cream.

Port Clinton, O.—The Esmond Dairy Co. will open its new plant here soon under the management of R. E. Miller. The new plant will be one of the most modern of its kind in northern Ohio, and thousands of gallons of ice cream will be manufactured every week.

Welland, Ont.—The Martin Milk Products, Limited, opened recently and is working to full capacity.

East Liverpool, O.—The Crockery City Ice and Products Company has installed a 50 quart Progress horizontal freezer.

Brookville, Pa.—The business of Clark Brothers has been sold to the Brookville Ice Company, who recently began to manufacture ice cream. Clark Brothers will open another plant at Indiana, Pa., which is to be completed in about two weeks.

Brookville, Pa.—The Brookville Ice Company recently begun operating its new ice cream plant.

The new Brookville Superior ice cream is now being manufactured under the supervision of Mr. W. C. Glassco who comes to Brookville after 25 years' experience in the ice cream business in some of the larger cities of the eastern part of the state.

Special attention will be given to brick ice cream and fancy molds for special occasions.

Hooversville, Pa.—The local ice cream factory, operated by Rodgers Bros., opened for business recently.

Connellsville, Pa.—The business of the Rose Ice Cream Company has been sold to the Hagen Ice Cream Company of Uniontown, Pa.

Kingston, Pa.—The Fadden Ice Cream Company is about to open its new plant, which represents an outlay of approximately $200,000. It is constructed of reinforced concrete, brick and steel.

It is almost entirely enclosed in glass, which permits sunlight to penetrate all rooms of the building. The highest quality of ice cream manufacturing machinery has been installed.

From a very small beginning in 1912, the business has grown until at the present time it requires more than 80,000 square feet of floor space. The business has been built on the combination of quality and service, and these same qualities have been carried forward in the construction of their new plant.

Philadelphia, Pa.—Because of rapidly increasing business, the Abbotts Alderney Dairies, Inc., have installed a 100 quart Progress brine freezer.

Chester, S. C.—The Chester Ice Cream Company was recently incorporated here with capital stock of $7,000. The officers of the firm are: R. C. Gray, president; Earl Wilson, vice president, and R. B. Owings, secretary-treasurer.

Belle Fourche, S. D.—O. H. Barnett has been engaged for the past few months in completely remodeling the cold storage plant at the Belle Fourche Creamery and adding modern equipment to the ice cream making plant.

The new hardening room is of good size and will enable them to maintain a temperature of fifteen degrees below zero.

An addition to the list of products for this season is the chocolate coated ice cream bar and machinery has been installed for manufacturing them. Machinery has also been installed for packaging ice cream at the plant and hereafter it will be sold that way.

Turner, S. D.—With its new equipment the Turner Creamery Company will be able to handle a much larger business, having a production of 600 gallons daily.

Fancy brick ice creams, heart and flower shaped molds for parties, and many kinds of fancy flavored creams are made by this company, to meet the constantly growing demand.

LaFollette, Tenn.—Operations have begun in the new plant of the LaFollette Ice Cream and Produce Company.

Lewisburg, Tenn.—The Lewisburg Ice Cream Company, a $10,000 firm, was recently incorporated here for the purpose of manufacturing ice cream. W. H. Freeman, Louis Koelling, E. H. Smith, C. E. Craig, and J. P. Hardison are the incorporators.

Murfreesboro, Tenn.—The Rutherton County Creamery Association has increased its capital from $10,000 to $50,000.

Nashville, Tenn.—The Union Ice Cream Company recently let a contract for the construction of a three-story reinforced concrete building to cost approximately $200,000.

Waycross, Va.—The Glynn Ice Cream Company, of Brunswick, has purchased and is now operating the plant that was formerly operated here by Seymour Phelps.

Mt. Vernon, Wash.—The Highland Dairy has recently installed a considerable amount of new equipment and began the manufacture of ice cream. An open house day was held and the public invited to inspect the plant.

Charleston, W. Va.—The Angel Cream Corporation of Charleston, was recently incorporated for $25,000. The officers are: O. Stirrat, president; E. F. Kirgan, vice president; R. A. Coyner, second vice president; Sam Cummins, secretary and treasurer. Mr. Stirrat stated that Angel Cream is a combination of ice cream and cake which was developed recently after years of study. The patents of this secret process are now pending in Washington. The cake from which Angel Cream is partly made is first baked and then a layer of icing is applied; after which the cream is poured on top. It is then put through a refrigeration process at 10 degrees below zero and left to harden for 48 hours.

Cline Ice Cream Company has secured the right of distribution for this territory.

Grafton, W. Va.—The Acme Ice Cream Co. has recently made further improvements to their plant in this city. Shortly after the plant was taken over by Mr. Lee, of Clarksburg, who is distributor of the well known Coca-Cola drink in this territory, several improvements were made and now the additional enlargement and increased efficiency of the plant make it one of the best in this territory.

Several thousand dollars' worth of machinery has been purchased and installed in the plant.

Mr. Lee claims he intends to continue the improvement of the business until it is deserving of the highest success.

Lake Geneva, Wis.—A new ice cream factory and a candy and ice cream factory are under construction in Lake Geneva.

Freeman Mann is building a two-story factory for the Mann Candy Company. The first floor will be devoted to the manufacture of ice cream, the brine method being used for freezing and preserving. The upper floor will be devoted to the candy factory.

Joe Nutini is building a good sized ice cream factory on the rear of his Lake Street property. Cement blocks are the building material being used.

Milwaukee, Wis.—The Luick Ice Cream Company has installed a Myers and Burt brick machine and a 12,000 pound Progress milk filter.

Neillsville, Wis.—Excavation for the new creamery and ice cream factory of the Neillsville Milk Products Co., is about completed and work has begun on the concrete foundation.

Platteville, Wis.—J. A. List retires from the manufacturing soft drink business here. His son Louis J. List continues the soft drink and ice cream factory.

Rhinelander, Wis.—The Oneida Milk and Ice Cream Co. was incorporated here recently with capital stock of $10,000. Wm. Gilley, George Burkhardt, B. D. Rathburn are the incorporators. The new firm will deal in and manufacture dairy products.

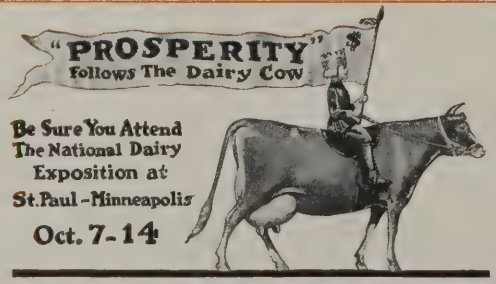
The Cherry Model 50

This Freezer was designed and built to give maximum production at an extremely low cost per dollar of its purchase price.

Its removable cylinder (a patented, exclusive feature) and ready access to all working parts, makes it an easy machine to operate; and easy to keep in prime sanitary condition.

Several thousand are in use --- some of them for a number of years of continuous production in plants that freeze every working day of every year.



For full particulars send for Bulletin No. 2011.

BALTIMORE

June 23, 1922.

The Association of
Ice Cream Supply Men,
1328 Broadway,
New York, N. Y.

Gentlemen:-

It would fill a book to write all the benefits I have derived from attending ice cream shows and conventions. I absolutely attribute my entire success to the knowledge attained at these meetings. I still not only attend all National Supply Men's Shows, but nearly every state convention that is within reaching distance, and never do I leave one that I do not bring back a valuable little book filled with dollars.

It goes without saying, of course, that the ice cream show is really as important to us as the convention, but now that the two are to be held together, a fellow should borrow money, if he had to, to be in Cleveland during that time.

Yours very truly,

L. Manuel Hendler

BULLETIN OF EVENTS

National Dairy Exposition, Minnesota State Fair Grounds, Minneapolis--St. Paul, Minn., October 7-14, 1922. W. E. Skinner, Secretary, Ryan Hotel, St. Paul, Minn.

National Exhibition, Association of Ice Cream Supply Men. Cleveland, Ohio, October 16-21, 1922, headquarters Hotel Winton. Robert Everett, 1328 Broadway, New York, Secretary.

National Association of Ice Cream Manufacturers. 22nd annual convention, Cleveland, Ohio, Hollenden Hotel, October 16th, 17th and 18th. N. Loewenstein, 155 N. Clark Street, Chicago Secretary.

Pacific Ice Cream Manufacturers' Association—Annual Convention, Davenport Hotel, Spokane, Washington, November 13, 14, 15, 1922. Bert H. Walker, Royal Ice Cream Co., Tacoma, Wash., Secretary.

Southern Association of Ice Cream Manufacturers, annual convention, New Orleans, December 5, 6 and 7. J. W. Clopton, Secretary, Decatur, Ala.

REPORTS from all parts of the country indicate a very satisfactory ice cream business. With favorable weather conditions the remainder of the summer the ice cream manufacturer should be able to close his books at the end of the year with a smile. Many of them, especially those in the southern states, have a great big smile coming, too. There was little to feel mirthful about last year. Some manufacturers will, of course, fail to make a profit. There are always a few men in any business who try to see how cheaply they can produce what they have to sell and then cut prices until there is no profit in the business. The man who keeps up the quality and who charges a reasonable price is the one who wins.

Speaking of cutting prices we are prompted to add that often the worst offender is the fellow who doesn't know what it is costing him to do business. He figures his cost of production too low and thinks he is making a profit while selling ice cream at a price lower than the man who knows what he is doing can produce it. This makes mighty mean competition.

The new man going into the business often furnishes this kind of competition. He fits up a nice factory and for the first season at least his cost of replacing worn out equipment is very low. Not until he begins to feel the heavy cost of replacement does he realize that he has been fooling himself. Then he wakes up to find that he has been doing business on money he put into the enterprise instead of money made in the business. In the meantime his competitors who have been trying to do business on profits made out of the business have been doing some heavy sweating. About the time the first mentioned fellow gets his business adjusted on a reasonable basis along comes another fool with money to spend on his ice cream education. Thus is life made interesting for the ice cream manufacturer.

WE ARE sure our readers will be interested in reading the many communications which appear in this issue. We wrote to a number of ice cream manufacturers, living in all parts of the country, asking their views relative to certain definite questions which we consider of vital interest to ice cream manufacturers. Some time ago a reader informed us that he was having trouble with the flavor of his ice cream. When the cows were turned out on grass the cream developed a peculiar flavor, in fact it developed a sour taste when made into ice cream. He reported that he has had this trouble each year when the grass is growing very rank and contains an excess amount of moisture. We passed this question on to a number of ice cream manufacturers and also the dairy experts at the various agricultural experiment stations. The replies are printed in this issue and should be of special value to the ice cream manufacturer who has experienced this trouble. Another question of interest is one which we put up to ice cream manufacturers relative to the tests they employ to determine the quality of gelatine used in their mix. These replies will also be found in this issue.

We want to thank the many readers who have responded to our questions and to assure them that their co-operation is highly appreciated. In this connection we cordially invite others to submit their problems and we will employ our best efforts to gather reliable information for them. We want to make The Ice Cream Review a clearing house for your problems. We feel that in this way we can make it of greatest value to the industry.

THE Publicity Committee of the National Dairy Exposition has adopted the following slogan for this year's event: "PROSPERITY FOLLOWS THE DAIRY COW. Be sure you attend the National Dairy Exposition, St. Paul—October 7-14—Minneapolis." Good!

AN EFFORT is being made to standardize equipment for dairy manufacturing plants with lower costs ultimately in view. At a meeting of the Illinois Butter Manufacturers Improvement Association, held in Chicago recently, Mr. S. J. Van Kuren, of J. G. Cherry Co., delivered a most interesting talk, in which he emphasized the need of standardizing much of the equipment on the market. A committee representing the International Milk Dealers' Association has been working with a committee representing the machinery manufacturers and real progress has been made in an attempt to standardize milk plant equipment and supplies.

Mr. Van Kuren emphasized the fact that manufacturers cannot reduce costs of production without laying up stocks. Under present conditions the manufacturers are building "to order" all the time and, of course, this means waste in the cost of production. The buyer suffers as a result. It looks as if ice cream manufacturers might well give attention to this question of standardization and arrange for a suitable committee to work with the manufacturers, who are willing and anxious to reduce costs.

A FEW years ago one Alfred W. McCann, a sensational New York City writer, contributed a series of articles for a local newspaper in which he attacked the creamery industry of the country. He posed as an authority on food products and when he put his O. K. on a particular brand of butter (incidentally the manufacturer carried an advertisement in the paper) nothing but good words followed for that particular brand. The brand that did not get his stamp of approval was likewise made to appear as dangerous to the public welfare. Be it said to the credit of the creamerymen of the country, very few became parties to this sort of a program and McCann eventually turned his attention to more fertile fields.

He has recently broken loose in the ice cream pasture and New York City ice cream manufacturers are getting a taste of his style. Our advice to them is to pay no attention whatever to him and he will soon run out of gas. Don't pay tribute and he will hunt greener pastures.

SOME retail dealers appreciate the possibility of greatly increasing the sale of ice cream in their locality by giving the right kind of service to the home trade. They are not satisfied with the sales over the counter or at the fountain; they encourage housewives to place their orders for ice cream, to be delivered at a certain hour, so that it will be in the right condition for serving at meal time. When the customer wants an order of ice cream delivered at 6:30 p. m., the delivery is made at that time and in good condition. The customer is made to feel that his patronage is appreciated and that he is not asking a favor when he asks the dealer to make the delivery.

Dealers in other food products are meeting this growing tendency on the part of city consumers to order the day's supplies, and they make delivery promptly and in good condition in order to hold and build up trade. They know that if they give the right kind of service the matter of price is a secondary consideration in the minds of their best customers.

With the sanitary containers now on the market the retail dealer of ice cream has opportunities to greatly increase the consumption of ice cream over what it has been in the past. The progressive ice cream manufacturer spreads the idea among his retailers and cooperates with them in every way possible to build up their trade. He backs up the retailer's effort to increase the consumption of ice cream in the home by efficient advertising, and by giving him the benefit of his experience in handling ice cream.

ANNOUNCEMENT is made on another page to the effect that the General Offices of the National Dairy Association have been temporarily moved to the Ryan Hotel, St. Paul, where Manager Skinner and his corps of assistants will hold forth until after the National Dairy Exposition. Committees representing the business interests of Minneapolis and St. Paul are laying plans for the greatest advertising campaign that ever preceded a show. Folks in the Northwest are going to know that the National Dairy Exposition is to be held in their midst and that it will abundantly exploit the great industry which it represents. Make your plans accordingly.

IT IS reported that one of the oldest underwriting firms in the country has decided to discontinue writing insurance on refined sugar in storage. Many fires of unexplained origin in sugar have given rise to the theory that refined sugar is subject to spontaneous combustion. We don't know whether there is a real danger in storing sugar in such quantities as the ordinary ice cream plant carries, but the theory is worth keeping in mind. Have any of our readers had occasion to suspect that the sugar supply was responsible for a fire of unexplained origin? If so, please write us.

ARRANGEMENTS for the big doings in Cleveland are going on apace. Committees are working like beavers to present the best program that has ever entertained and instructed ice cream manufacturers, and for the greatest display of ice cream machinery and supplies ever held under one roof. If you haven't made your plans to be in Cleveland October 16-21 don't put off your decision any longer. The best way to make sure to be there is to just make up your mind that nothing short of death is going to prevent.

A LARGE number of ice cream manufacturers have reported business conditions in their localities, and a summary of these reports for the different sections of the country will be found in this issue. Local business conditions are seriously interfering with the ice cream business in some parts of the country but reports generally are very encouraging. These reports have come to us since July 1st so our readers may accept them as representing conditions right now.

Ice Cream Means Ice Cream

By H. C. ASHBURN

THIS article is in response to one published in the July issue of Physical Culture Magazine, entitled, "What Do You Mean—Ice Cream?"

Perhaps it will be well to first state my qualifications in the way of knowing something about ice cream. I have been connected with the ice cream industry since I was eight years old, and for the past several years have been actively engaged in the manufacturing of ice cream. At the present time, I am superintendent of one of the largest ice cream plants in the state of Oklahoma.

In the first place, this scathing article makes the following statement: "No ice cream manufacturer tells the public how he makes his frozen dainty, or what is in it; the truth is he doesn't dare." This statement is too far-reaching and covers too much territory.

There was a time when most people believed as does Dr. Alfred W. McCann, the author of the article in question, and most people had the same conception of the ice cream industry as he does. That, however, was before the ice cream business became national in scope and was only carried on on a small scale, and when there were comparatively few local or state laws regulating its manufacture.

Dr. McCann expounds rather at length on the carpenter's glue that is used in place of gelatine, not making any exceptions, and thereby casting a false reflection on every ice cream manufacturer in the United States.

Dr. McCann also speaks of renovated butter. It is absurd to think that any reputable ice cream manufacturer would use low-grade butter for many reasons. One important tecnical reason is that it would increase the acidity of his mix to such an extent that it would be impossible to use it. Another reason is that it would give an "off" flavored product, but the last and biggest reason is that the ice cream industry as a whole is composed of intelligent business men who would no more give an impure product to the consumer than they would give it to their own children.

This article also states that the worst cow butter, unpasteurized may be used with commercial casein and river water. That is not the case. Practically every state in the Union has a law requiring the ice cream manufacturer to pasteurize his milk and it would be impractical to combine milk powder, water and butter and get a uniform product without pasteurizing the entire mix.

Speaking of casein—what could be more pure than casein? It is prepared under pasteurizing temperature, stored in a cool place and shipped in a sanitary container; it is also as nearly dry as it is possible to make it, thereby retarding bacterial growth.

Commercial casein, as you refer to it, is nothing but pure milk that has been pasteurized, minus the water.

The homogenizer, which seems to have the dislike of Dr. McCann is one of the greatest machines ever invented for the milk industry. The part it plays is to break up the fat globules and all other undissolved particles of serum or sugar solids, and distribute them uniformly throughout the mix, so that the ice cream mix is really a homogenous solution instead of an imperfect mixture, and has a much smoother texture and more velvety body.

This article also speaks of the poisonous flavors which the ice cream makers are afraid to advertise. As a matter of fact, the flavor does not constitute one six-hundredth part of the ice cream mix and could not harm a two-months child even if it were pure strychnine. Also most ice cream manufacturers use only pure extract in every gallon manufactured.

This article mentions the chemicals used in the form of "improvers." The base of all ripeners is rennet, which is obtained from the inner lining of a calf's stomach, which is an aid to digestion.

The improver is not in any way a chemical and its action on the ice cream mix is purely physical, merely causing the butterfat to harden, which is the same process that takes place when sweet cream is held in the ice box for a couple of days, so you can whip it. It just gives a more viscous body to the cream. The article in question, however, makes no mention of those plants which use no improver at all.

GELATINE IN ICE CREAM?

Yes, there's one one-hundred-and-fiftieth part of a gallon of pure food gelatine in each gallon of

A Pal for Your Palate — NATIONAL ICE CREAM — A Pal for Your Palate

and no other "Filler" whatsoever

FROZEN ONLY BY
NATIONAL CREAMERY AND PRODUCE CO.
LOS ANGELES, CALIFORNIA

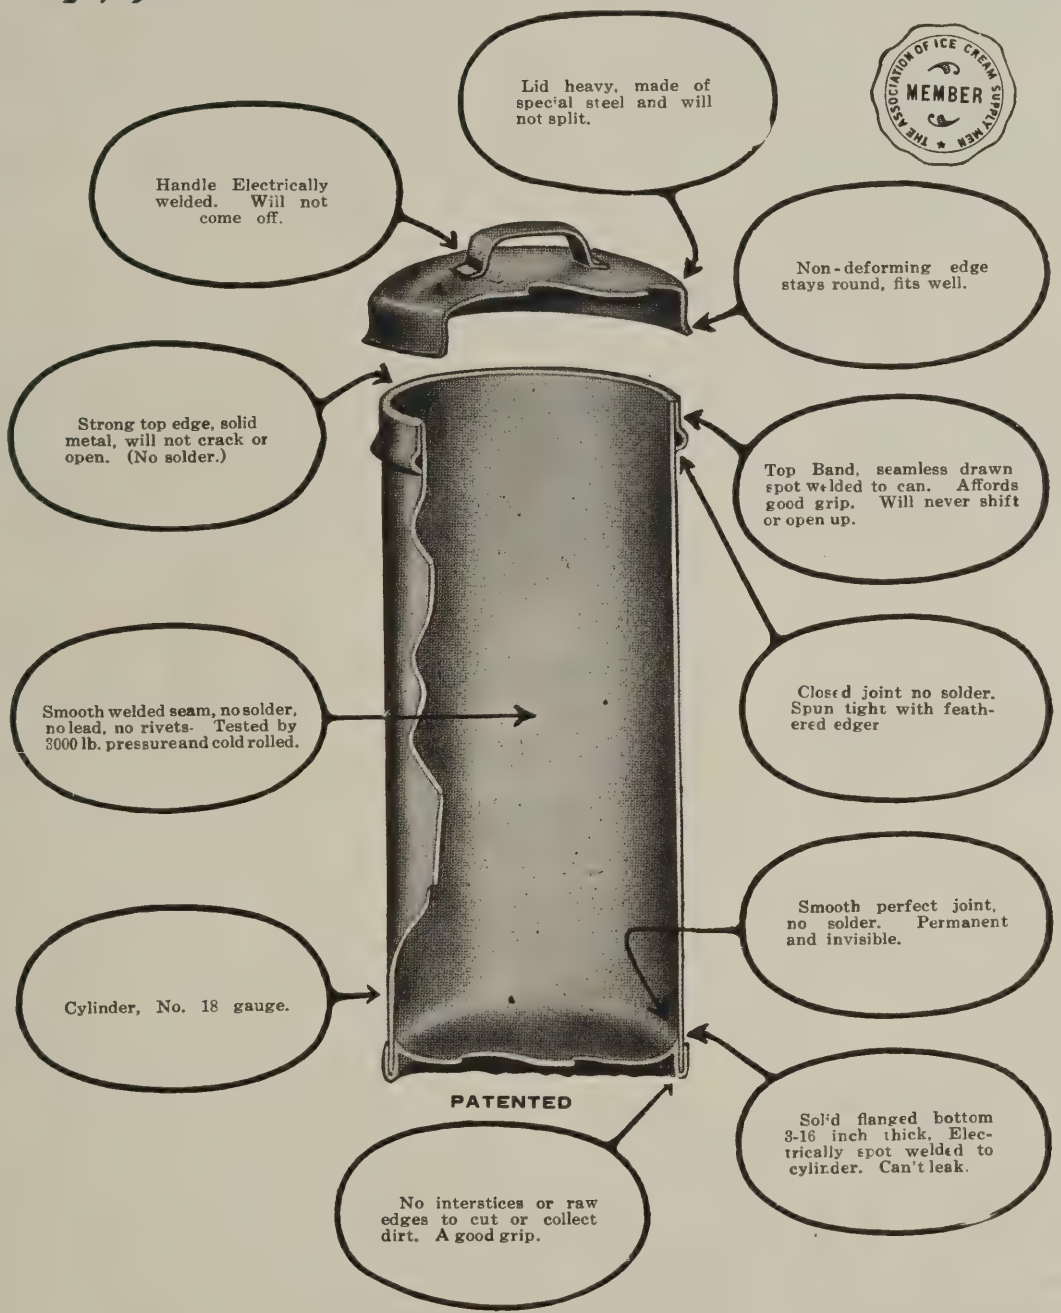
Reproduction of a "National" Advertisement.

There is also no mention made of the plants that use pure milk and cream to bring up the liquid content of the ice cream. The author, Dr. McCann, seems able to think only of "river water," as a liquid. It is my personal belief that not one-tenth of one per cent of the ice cream plants use water in their ice cream that you would hesitate to drink out of a glass.

I have seen many ice cream plants in my lifetime and have made a few million gallons of ice cream myself, and I can truthfully say that I have never made a gallon that I would not eat myself. Also, I have never in my life seen or known of a manufacturer who uses river water in ice cream.

Does Mr. McCann know that all gelatine used in practically every state in the Union (if utilized in the manufacture of food products) must be labeled under the Pure Food Act, and must be free from every harmful element? Also that most ice cream factories request and obtain a chemical analysis of each and every shipment of gelatine.

Only a short time ago, our A. & M. College made an analysis of several samples of gelatine, shipped clear across the United States and the highest bacterial count that was found in the lot was 2,000 per gram. The article mentions the impurities to be found in gelatine. Average gelatine contains the following:



Copper	less than	30	parts per million
Lead	less than	10	parts per million
Zinc	less than	100	parts per million

(Concluded on page 10)

Electric Weld

RIVETLESS SOLDERLESS ICE CREAM CANS

should be judged on a basis of the ratio of cost to service. The can that makes the most trips for the least cost is cheapest. We have other important features. Welded Construction securing all the advantages and none of the disadvantages of seamless can.

Electric Weld Rivetless-Solderless ice cream cans are easily and cheaply retinned, for they are ALL STEEL and PURE STRAITS TIN and have no solder to remove.

"Some Aspects of Price Cutting"

The following is a portion of an address on the above entitled subject, delivered in Chicago on June 8, 1922, before a trade organization by Hon. Nelson B. Gaskill, Chairman, Federal Trade Commission:

"It is axiomatic that a selling price must include a margin over production cost sufficiently large to include a balance after deduction of all charges incurred but not properly included in production cost, if the sale is to result in a profit. A normal, profitable selling price, therefore, may range from the 'market' as its maximum, to 'production cost' as its minimum. If it is above the market it is not likely to induce a sale, and if it is below production cost it will not produce a profit.

"Competitive selling prices, therefore, which must range between market price and production cost if they are to be profitable, represent the desire of the seller to effect a sale within limits which he cannot transgress, and over but one of which can he exercise any lawful control.

"The proper object of business is and its necessary result must be, profit. It seems almost unnecessary to assert or to attempt to demonstrate this proposition, yet a clear perception of its meaning and application is essential to my thesis.

* * *

"Price cutting is, of course, price making. It is the expression of the extent or degree of the desire to sell. It may be directed against the market, in which event it is adverse to all competitors or it may be thrown forward against competitors in a particular locality or against a particular competitor. It may represent the seller's relation to conditions of supply and demand, it may express his individual preference for volume of sales, it may represent his efficiency and advantageous location as shown in his relatively lower cost. A selling price may represent any or all of these elements, but if it is to be profitable it must exceed the seller's individual cost, and if it is to be consistent with the fundamental principle of the competitive system, it cannot be less than the seller's own cost. Habitual selling below cost as a method of doing business is, in my judgment, an unfair method of competition.

"There are circumstances, of course, which justify its emergent use, just as there are conditions which justify the amputation of a limb. But these are outside the rule, not exceptions within it. The necessity for liquidation, for keeping an organization going through temporary stress, possibly during the introduction of a new industry in a competitive field, these are emergencies which justify an impairment of capital. But selling below cost is no more a part of the ordinary conduct of business under the competitive system than self-multilation is necessary to living.

* * *

"Cutting selling price below cost is impairment of the seller's capital and nothing less. It is pouring out of the reservoir more than is taken in. In economics as in physics, this means the emptying of the reservoir, the exhaustion of capital. It means absolutely inevitable bankruptcy to the one who practices it unless the deficiency can be offset by a more than equal gain elsewhere. There is one fact of which all competitors and the consumers can be absolutely certain. The habitual seller below cost who continues in business for any considerable period, is receiving from the consumer by other means more than enough to offset his losses. Or he will do so as soon as his practice has sufficiently suppressed competition and established what is equivalent to monopoly. When the consumer lears the simple fact that business cannot be conducted at a loss, he will awake to the startling realization that nothing which he buys at a price below its cost represents a saving. And he or she will also learn that a premium article is a most expensive piece of decoration.

* * *

"Two men conduct shoe stores in a certain town. In free and fair competition neither can habitually sell any line of shoes at less than the seller's cost. One buys out the other and conducts both stores as one establishment. Has he gained thereby any right which he did not have when operating but one store? Clearly not. What could be the course or origin of such a right? Buying the other store he succeeded only to the rights which its previous owner had and in the operation of botn stores, the single owner is subject to precisely the same limitations as when he owned but one store. He may not in either store sell any line at less than the cost of that line without violating tne principles of free and fair competition. By the same process of reasoning, he may not conduct one store at a loss and counterbalance those losses by gains from the other.

Now it is immaterial that this suppositious shoe dealer does business under two roofs. If he moves to more commodious quarters and closes both the old stores, no new economic or legal rights settle upon him while ne is moving, nor do any of his limitations go to the junkyard with his old store equipment. Still he may sell no line at less than cost, and tnough he nas departments in a store rather than branch stores, he may not run one department at a loss and compensate by gains in another because his legal and economic relationship has been in no way changed by his changes in form. It makes no difference that he may add a line of hats and subsequently a line of hosiery. If the proposition which I have stated is true as to the sale of a single line it is true as to the sale of as many lines as a seller can compass and the housing of the business has no effect in this connection.

"Here is the crux of the whole price cutting matter. The single line seller who sells below cost is quickly and simply removed from businss by the laws of mathematics and his creditors. But the field of business is harassed and frenzied by tne dealer who has the power to recoup losses sustained by selling one or more lines below cost by compensatory gains on the remainder of his business.

"The so called 'fighting brand' is the typical example. In a report on the tobacco industry a Commissioner of Corporations cited certain competitive practices which may be summarized as follows: The American Tobacco Company dominated the cigarette business in the early nineties, but its plug business was comparatively small. It set about securing a dominating position in this line also. As a weapon in this campaign it used one brand of plug tobacco, 'Battle Axe,' the retail price of which was cut from fifty to thirty cents a pound and the wholesale price of which, less internal revenue tax, was put at one time as low as seven cents. In territories where rival brands were favorites, men were sent through the country distributing samples; they presented a plug of 'Battle Axe' to every man they saw. During four years, 1895-1898, the company made a net loss on its plug business of $3,300,000. But it effectuated its purpose by obtaining and holding, during these years immediately following, a substantially monopolistic control of the plug tobacco market.

"But the practice has not been generally recognized for what it is nor has it been given the universal condemnation which it deserves. Its seeming advantages to those who are possessed of the power to use it, its seeming attractiveness to those who deal with them, have secured for the practice a condonation which has endured too long.

"No one abuse of competitive methods is in my opinion responsible for more effect on the part of those who suffer from it, to escape its effects by unlawful agreements than this practice of conducting some part of a business at a loss with a compensatory gain in the remainder and a profit in the whole. There is no escape for the competitor in the single line in which the loss is taken but an unlawful group action. And naturally he prefers his chances under the anti-trust laws to the certainty of bankruptcy.

* * *

"Because I believe that selling below cost is an unfair method of competition, I believe that a group agreement not to practice this method of doing business is a lawful agreement. It is, it seems to me, as much a matter of internal concern and action in a trade association as is misbranding or commercial bribery.

"In an address delivered elsewhere (Association of Cost Accountants of the Paper Industry, October 7, 1921) I advanced the proposition that each individual business unit should ascertain its own cost and fix its own selling price with due reference thereto. I urged upon trade associations the opportunity and the necessity for education in cost ac-

BUILT IN 30 WORKING-DAYS

Interior of an Austin No 3 standard building. Normal width 100 feet. Length in multiples of 20 feet.

Why Wait Six Months?

You can have 40,000 sq. feet of building like that shown above ready for useful occupancy in 30 working days. And you can have this delivery guaranteed on a $100 a day penalty and bonus contract. Why wait six months?

You can also gain competitive advantages in your production operations, put your capital investment to work several months earlier than usual and avoid all of the delays, extra supervision costs, responsibilities and annoyances that surround the average long drawn out building operation.

And you will have a building suited to your needs. It will be a permanent substantial structure. Read the following brief specifications.

Excavation and Grading for standard foundations and floors. Based on normal site and conditions.

Concrete Foundations, depth 4 feet below floors. Concrete floors 5 inches thick.

Brick Side Walls.

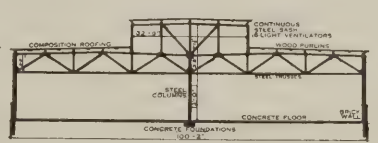
Rolled Steel Side Wall Sash, Truscon, Fenestra, Lupton or equal.

Mechanical Sash Operators for monitor sash.

Concrete Window Sills.

Structural Steel Frame, 2,000 square feet of floor space per column.

Roof Structure, structural steel trusses, yellow pine purlins and roof sheathing. Note—Trusses designed to carry 2,000 lbs. at any panel point.



Roof Waterproofing, 4-ply built up composition roofing.

Austin engineers can deliver many other types of buildings in an equally short time or assume complete responsibility for the equipment as well as the engineering and construction work. Under the Austin method you buy your buildings the way you buy your machinery—you buy a definite type of known value.

Consultation with Austin engineers involves no obligation. Phone, wire or use the coupon.

THE AUSTIN METHOD

A contract for an Austin No. 10-F Standard Building was recently received from Buenos Aires, Argentine Republic. Austin examples will be found in many other foreign countries.

Cross Section of an Austin No. 3 standard building

counting methods among their members. That argument is a necessary element in the proposition which I am stating here. Unless cost is known, profit is unknown, and whether a selling price is below cost is a matter of guesswork. The business man who fixes his selling price without accurate knowledge of his production cost and without keeping above it, is on an industrial joy ride. He is not only in peril himself, but he is a constant source of danger to others.

"The starting point of all operations against selling below cost must be proper cost accounting by each individual. Common cost figures, group averages, normal costs and all averages or group allowances, play no part in this work. What is to be determined is the cost to the seller, not to someone else nor what cost would be to the seller if his conditions were changed. Education in accounting methods, the inspiration to use them and to work by the result shown, these are great opportunities for trade associations. But every suggestion which opens the way to the individual to adopt a standard, a normal, an average which does not reflect the individual's cost, is a deterrent to cost accounting and an inducement not to use it.

"No movement within an industry for the elimination of sales below cost can be conducted except in conjunction with and as a part of a campaign for the employment of a proper system of cost accounting. Nor can any movement to suppress sales below cost be put into operation except upon a cost accounting basis. It is easy to condemn selling below cost, it is not difficult to see wherein its evils lie nor is it particularly troublesome to perceive that it may be unlawful in habitual practice. But the proof of the charge is the relentless analysis of the actual cost of the operations preceding sale.

"The elimination of sales below cost by no means implies a stabilization of prices nor a uniformity of prices. It is when properly applied in no sense a restraint upon competition. Costs will vary and prices should vary as costs vary within market limitations. But the application of the principle 'no sales below cost' by each to his own business is simply the recognition and adoption of the fundamental principle of the competitive system.

"Nothing that I have said is really new or strange. If it seems so it is merely because we have forgotten much, or failed to apply what was once well recognized, to the changed conditions of today. Old almost as English law is the maxim that one must not use that which is his so as to injure another. Taking that rule out of its Latin verbiage and applying it to present'day conditions, one finds in it very clearly a recognition of the principle of the competitive system. One man may not conduct his own business so as to injure another. Selling below cost with compensatory gains in an allied line is the use of the seller's property in a way which clearly injures his competitor."

Bills were mailed June 24th to members who have not yet paid their dues. As Convention time is approaching you will of course wish to be in good standing, so please send check to cover. Just take your trusty pen in hand, make out a check and mail it at once. Then it will be off your mind for another year.

CHARLES G. MORRIS, President. N. LOEWENSTEIN, Secretary.

ICE CREAM MEANS ICE CREAM.

(Concluded from page 6)

Arsenic ..... less than 2.4 parts per million
Sulphur Dioxide ..... less than 350 parts per million

There is a disease known as aneurism of the aorta, which wastes away the lining of the main artery of the body. Gelatine is the only known agency that will restore and build up that wasted tissue. Gelatine also keeps the casein of the ice cream from coagulating in the human stomach and in that way, aids digestion. If a small amount of gelatine be added to baby's milk, it will be found to be more easily digested.

Out of inquiries made of over 200 ice cream plants, representing every state, there were only 4 using gum exclusively; 18 using gum in connection with gelatine and the other 178 plants used pure food gelatine exclusively.

The statement made that ice cream will stand the sun for an hour and not melt because it is solidified with glue is absurd. Gelatine does strengthen the cells of the frozen product but it is the proper aging of the mix at a low temeprature that gives ice cream its body.

Dr. McCann discusses the lowering of the butterfat standard from 14 to 8 per cent and states that this allows a greater portion of the mix to be river water. A little deeper study of this fallacy, for it is a fallacy that is shared by many, will show that excessive butterfat content is a detriment. The only part that fat plays is to furnish heat and energy to the body. Consequently when a dish of high butterfat content ice cream is eaten, you are defeating your own purpose, which is presumably that of cooling off. The body is fired with the excess fuel, represented by the fat in the ice cream and in a few minutes the body is warmer than before eating the ice cream. The more fat content in the ice cream, the higher the chemical heat in the product.

Also, ice cream to be properly balanced can contain a limited amount of total solids. When the fat content is increased, it is necessary to decrease the more valuable food element, serum solids. The serum solids are the bone and tissue, or body-building properties of the ice cream. Pure milk contains approximately 4 per cent fat and 9 per cent serum solids.

Milk is recognized as the one perfect food and the closer the ice cream makers can make their product to conform to the portions of milk, the more nearly perfect food they will have. Therefore, let us make a comparison of the products.

Take a 14 per cent butterfat content—13 per cent sugar and a total solid of 35 per cent mix. That leaves just 8 per cent for serum solids. The proportion there is 7 fat to 4 serum solids.

Now take a 10 per cent fat—13 per cent sugar and 35 per cent total solids mix. In this mix, we may use 12 per cent serum solids or 50 per cent more tissue and bone building material than in the 14 per cent fat mix. We are also reducing the fat content 4 per cent, which as stated above furnishes heat and energy to the body. This also brings the proportion down to 5 fat to 4 solids, which is getting close to the proportion of the perfect food, milk.

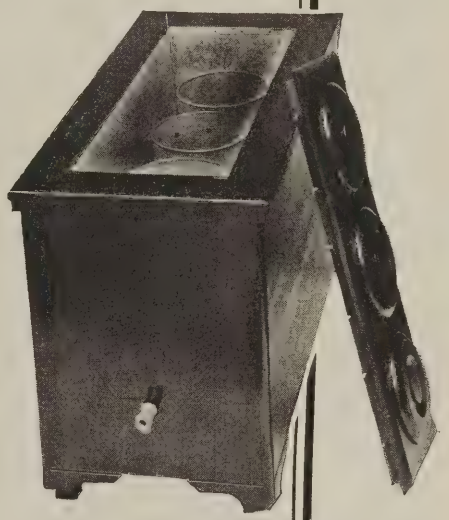
Consequently it is plain that the idea of an excessively high butterfat content in ice cream for a food is a fallacy. As a matter of fact an 8 per cent ice cream is more wholesome than a 14 per cent fat ice cream.

You state that Director James Foust, conducted a crusade against the chocolate coated bar, and that of numerous samples taken not one was found to contain any tallow or paraffine, and thereby Mr. Foust had knocked the paraffine out of the chocolate coated bar. May I ask how you can logically state that Mr. Foust had knocked the paraffin out of the bar when not a sample analyzed was found to contain any adulteration, and no evidence was found of any having ever been used?

In conclusion I merely want to ask what object would ice cream manufacturers have in view in putting out an unsanitary product when they may, by maintaining a high standard of quality, build up a larger volume of business, retain satisfied customers and by the increased business, make the ice cream industry a much more remunerative occupation.

A small cash investment and the services of a live young man in the ice cream business are what many proprietors are in need of. You can locate good opportunities through a Review Want Ad.

ECONOMY CABINETS



21-quart Brick Cabinet 2 Dozen Eskimo Pies

Economy Brick Cabinets

The best keeper of Brick Ice Cream or Eskimo Pie. Very heavily insulated and icing space on all four sides of brick container, thus giving perfect refrigeration to each pie or brick. Liner and brick container made of Armco Iron.

Economy Metal-lined Cabinets

Especially designed to keep bulk ice cream at its best quality with the least possible amount of ice. Strongly constructed, heavily insulated and lined with Armco Ingot Iron. Supplied with slip rings to keep can in place and convenient for re-icing. Finished in mahogany.

3 Comp. Metal-lined Cabinet

Economy Tub Cabinets

This separate compartment cabinet is especially designed for rural trade so that one compartment alone can be used without being compelled to ice the entire cabinet. The tubs in these cabinets are especially treated to prevent leakage. Finished in highly polished mahogany.

Eliminating the Grassy Flavor in Ice Cream

A Discussion of this Difficulty by Ice Cream Manufacturers and Experiment Stations

FLAVOR in ice cream has been very aptly called "The Silent Salesman," and there is no doubt about its being the greatest quality of ice cream. Excellent flavors can be purchased on the market. but when there is an original flavor in the cream, it is impossible to put in enough artificial flavor to counteract or "cover it up." Grassy flavor is one of these original flavors in cream, and a reader of The Ice Cream Review recently wrote in, saying:

"At this particular time of the year when cows are on the green grass after they have been closed in and fed dry feed the milk sometimes develops a very peculiar flavor; in fact, it tastes as if it is a little sour after it is made up into ice cream. We find this more particularly so when grass is growing very rank and fast and when the blades of grass are full of water or moisture. This difficulty does not arise every year, but some years we have a great deal of trouble along this line. We are unable to counteract this flavor with flavoring extracts and have a great deal of trouble explaining this condition to the trade."

We had our first experience in trying to "cover up" a flavor back on the farm when we were just small enough so that we didn't have to work. We used to go out and pick ourselves a dish of strawberries every forenoon during the season. It became too monotonous for us to put sugar on the berries every time, so we put salt on one morning. Needless to say, the flavor didn't suit us and we tried to "cover it up" with sugar. The result was we had to throw our strawberries away, and just missed further discomfort by being wise enough to keep still when Ma wondered why the sugar bowl was empty.

The thing we want to stress is to keep undesirable flavors out or eliminate them, if possible, and never try to counteract or cover them up.

Some ice cream manufacturers avoid the grassy flavor; one says "We use powdered milk during the early grass season and thus avoid the strong grass flavor;" and another says, "It doesn't cause us much worry here. We just explain it to our customers, and it is all right because everybody else has the same trouble." But most manufacturers are under circumstances that make it preferable for them not to use either of these practices, and a consensus of their methods of dealing with grassy flavor is given below:

Caused by Feed of Individual Cows.

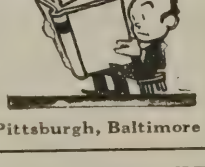
The trouble which your subscriber has is quite common in most sections of the Middle West, particularly in the spring when the cows are first turned out on green pastures. If the flavor is not overly pronounced it is commonly called "grassy." If the flavor is more abnormal as is the case when the cows have access to and eat wild onion it is known as oniony or garlic. Oftentimes when the season is backward, due to dry or cold weather pasture weeds are as abundant as grass and the cow that has an extreme appetite for green shoots eats everything in sight, resulting in a more decided grassy flavor in the milk. This condition varies with individual animals; cows in the same herd with others, kept in the same pasture give normal milk. From this it would seem that the inclinations as to choice of grasses are different with different individuals. As the season advances and blue grass becomes more abundant the trouble ceases, thus indicating that the pasture weeds must have some influence on the flavor produced. It is not believed that the washiness or moisture content of the grass has much if any effect.

The writer had the following experience while operating a milk plant in Illinois: A patron brought in milk that had a very peculiar flavor. This was early in the spring, and due to cold, dry weather the pastures were short but the season was late and most farmers, having little or no feed left, depended entirely on pastures. We went to the farm for an inspection at milking time and found that eight out of thirteen cows showed the peculiar flavor. Five were normal. The cows, which were kept in a dry lot over night, were milked in the morning and the milk was found to be normal. The meadow pasture in which cows grazed during the day did not seem abnormal in its weed flora. It was therefore, evident that some particular kind of green growth which some of the animals consumed and others did not was responsible for the off flavor.

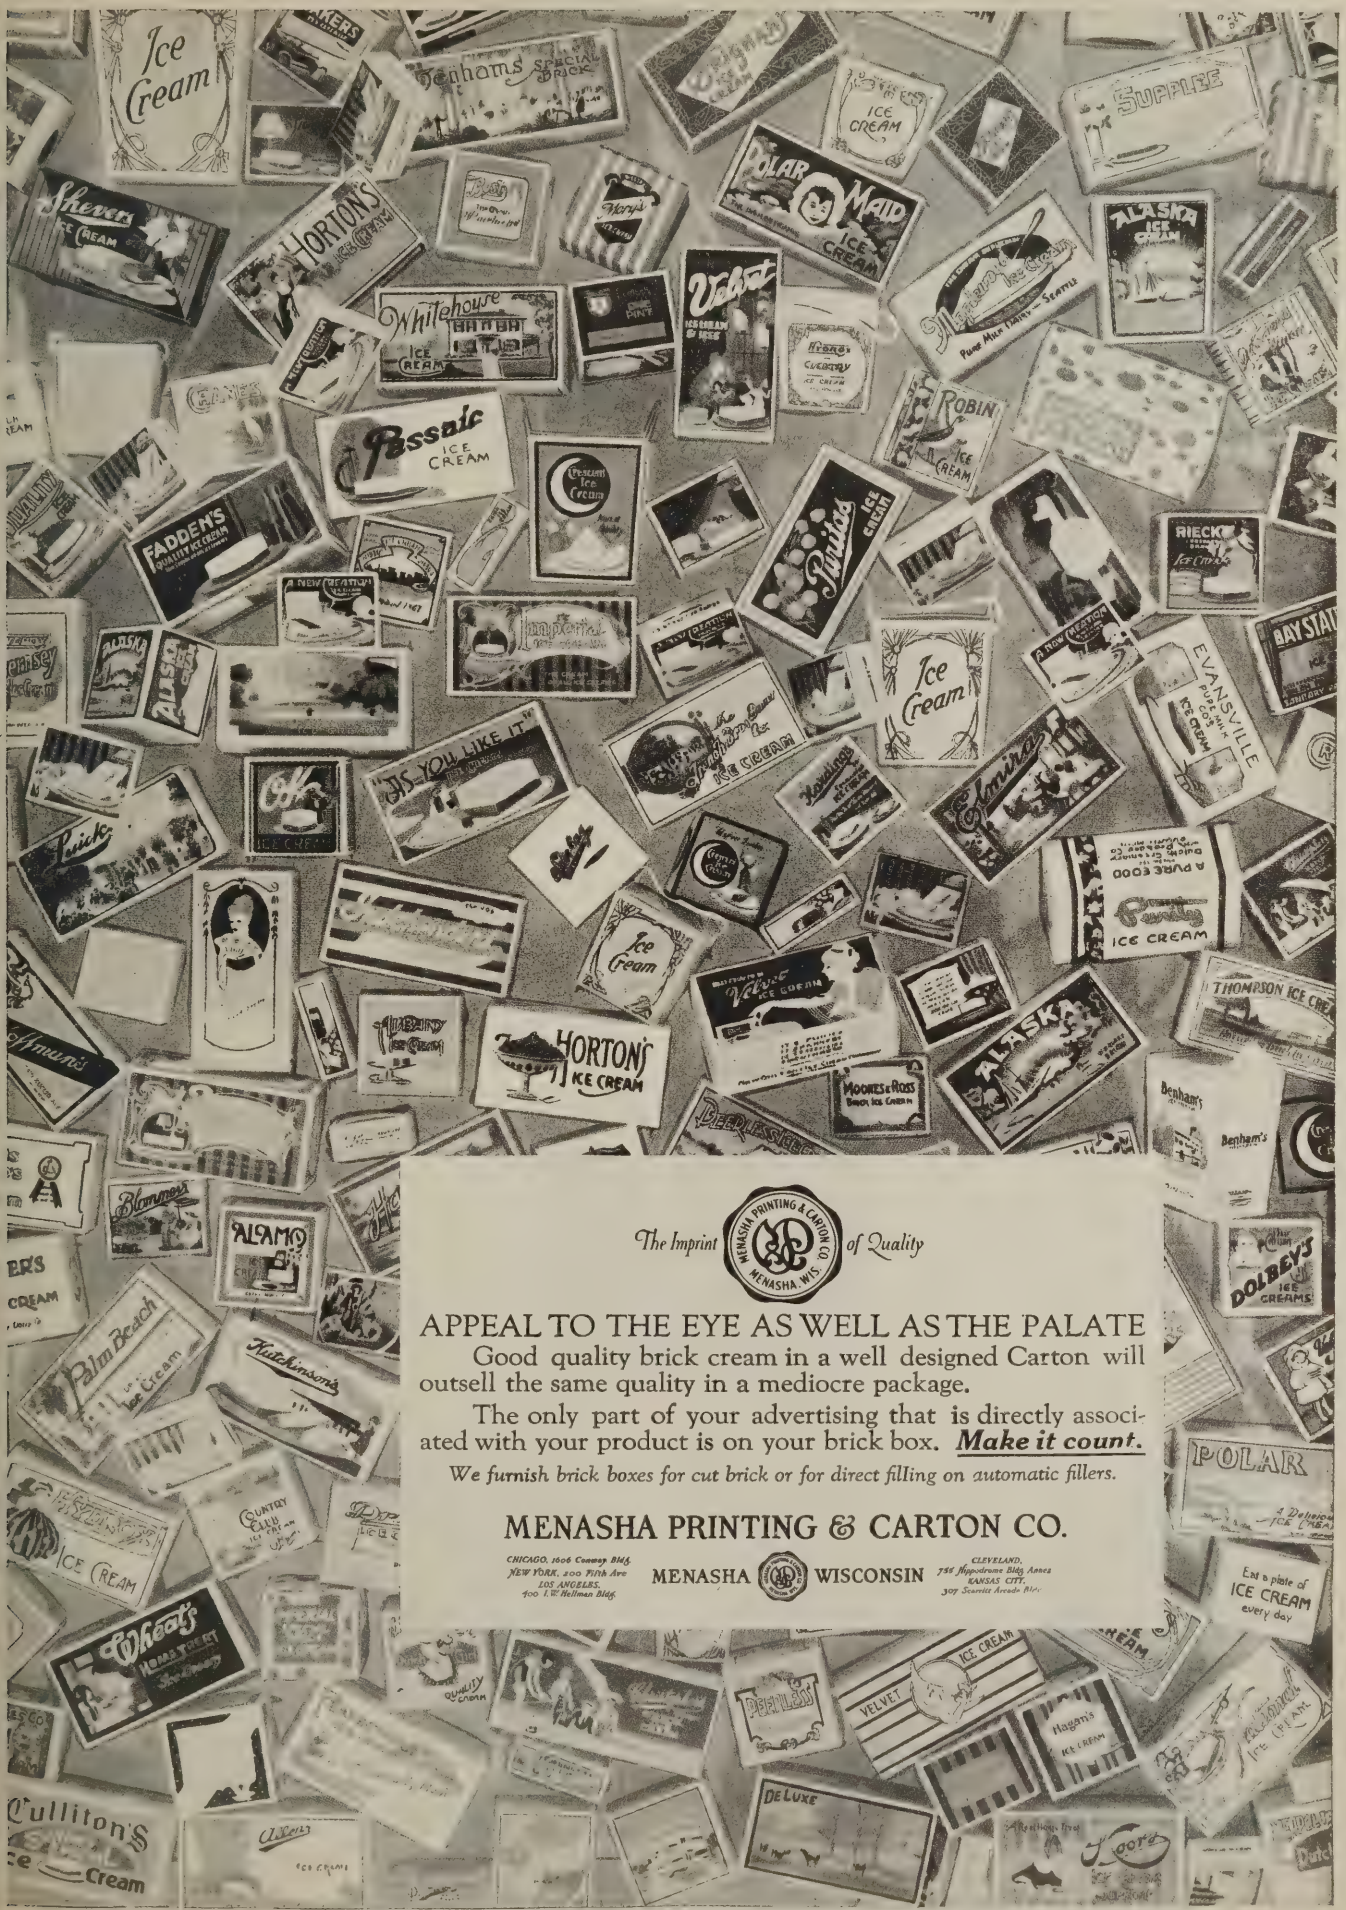
If the feed of a cow is to be altered the change should be made gradually. When the change is too sudden the physiological conditions surrounding the secretion of milk are disturbed and abnormal results occur. This well known principle of feeding is not always carefully observed and possibly has something to do with the grassy flavor so often noticed in the early spring. The continued feeding in the barn at first until grass is sufficiently abundant will aid in preventing grassy flavor.

When the defect is only slight, pasteurization will usually drive off the volatile taint; and the pasteurized milk and cream dealer will be free from the trouble that will bother the raw milk man. In case of stronger flavored milks and creams aeration must be resorted to. The method worked out by the United States Department of Agriculture Dairy Division on "Removal of Garlic Flavor from milk and cream" could be used. See page 60.

* * *



Cows Get in Hurry and Eat Everything.



I am inclined to believe that the trouble referred to in your letter is rather of local origin. Inasmuch as these flavors have appeared shortly after the cows have been put on green pasture for the first time in the spring it is quite likely that the cows have consumed the weeds which give the flavor referred to. Cows that have been fed inside and during the early spring being fed on dry feed develop a wonderful appetite for grass and no doubt a good many weeds are consumed in their ravenous attempt to get their first fill of green grass. Cows, as a general rule, are rather particular individuals when it comes to pasture weeds but it stands to reason that when they are first turned on to green pasture they will eat everything as it comes, while a little later they will be more careful and pick the grass from around the weeds. Ordinarily the flavors that we have encountered are easily covered up in ice cream and I am inclined to believe that the trouble referred to is perhaps some onion flavor or the flavor of onion origin which is practically impossible to eliminate.

A couple of years ago we were buying milk from one of our patrons for making cottage cheese. About a month after we had been taking milk from this particular patron we noticed a peculiar flavor in the cheese. This flavor and odor was not noticed in the fresh milk at first but after the whey was drawn the flavor and odor was very apparent and it was necessary to throw the cheese away. At first we thought the difficulty was due to contamination in the factory but after giving everything very careful attention we decided that it must be in the milk. We took a trip to the farmer's place looked over everything very carefully and found his milk room, barn and cows, and everything in very good condition. He was feeding a small amount of hay, which we looked over and found nothing in it to indicate that the flavor was due to any weeds or anything of that nature in the hay. Then we went out to the pasture and found very fine field of grass but here and there was a Dog Fennel standing about a foot high. We looked around very carefully, however, but could find none of these weeds which had been bitten off to indicate that they had been eaten. We, however, suggested that hereafter the man wipe the flanks and udder of the cow with a damp cloth before milking and from that time on we had no further difficulty. This would indicate that the cows

FANCY FORMS MAKE "SPECIAL DAY" ICE CREAM SERVING POPULAR.

Testing Gelatine

Methods in Use by Ice Cream Manufacturers, and Methods Recommended by Gelatine Manufacturers

ONE may visit a dozen ice cream manufacturing plants, and find as many different methods for testing gelatine for its purity and strength in use, if the gelatine is tested at all. Various tests are recommended by gelatine manufacturers and practical ice cream men who have written us on this subject. We quote them, as follows:

In testing gelatines for this purpose the most important factors to be considered are the viscosity of the gelatine solution and the strength of the jellies when they are set.

A viscosity test is a ratio reading showing the comparison of the rate of flow of a gelatine solution as compared with the rate of flow of water, both flowing through the same size orifice at the same temperature and in the same quantity. For a factory test make up a 15% solution of gelatine and take the time by stop-watch which 100 cc. requires to flow from 100 cc. pipette at 140 degrees Fahrenheit and compare this time with the flow of 100 cc. of water through the same pipette at the same temperature. The greater the ratio, the better the gelatine.

The setting power of gelatine can be determined by placing a 10% solution of gelatine in the ice box over night to permit thorough congealing and then compare the resulting jellies with the fingers for the strength test.

From a sanitary standpoint the numbers of bacteria should be determined on the dry gelatine together with the amount of amino acid present. These factors when considered jointly by any chemist will show which gelatine is made the most sanitary.

To permit several glasses of gelatine to stand on the table and then judge the keeping would not give you any line on the sanitation of the gelatine any more than it would if you attempted to compare several glasses of milk and cream for souring. This is due to the varying amounts of bacterial food in the different gelatines, just as there is a difference in the amount of bacterial food in milk and cream. The purity of a gelatine is hard to determine by a layman, and should be submitted to a reputable chemist and bacteriologist for his analysis for the reasons as above stated.

* * *

The method we use in testing gelatine is as follows:

Put one-eighth of an ounce of each sample of gelatine we wish to test into as many soda glasses, marking them, of course, in order to distinguish them. Into these glasses we put a tablespoon of cold water and stir the gelatine into it. To this we add 8 ounces of water heated to 160 degrees and stir until the gelatine is dissolved. We then place the samples in our cold room until the gelatine sets. We can get an idea of the strength of the different goods by testing with the tips of the fingers.

* * *

Supplementing our communication of the 22nd, will give you information on the way, according to our opinion, one sample of gelatine should be compared with and tested against another sample. In both of these letters we are assuming that the test will be more or less superficial, and that the party testing will not go into the chemical composition of the samples, but leave this entirely to the guarantee of the manufacturer. To go into the chemical side to determine the various impurities present would be too great a task, and we do not believe that you would even care to publish this information.

In making the test referred to in our previous letter, the sample of gelatine of known quality should be placed along side the sample to be tested. Equal weights of both samples being placed in clear water and by means of a double boiler heated to a temperature not to exceed 150° F. (We recommend six parts of water to one of gelatine for such a test). It will be necessary to hold this gelatine at this temperature for a few minutes until it has gone into solution. While hot, a comparative test for odor can be made. If this test is being made in hot weather, it would be best that the samples be placed in a cooler for a few hours to be positive that both are thoroughly chilled and jellied.

Jelly Strength. By simply testing the resistance to finger pressure, it can be easily determined which of the two samples has the greater jelly strength.

By holding these glasses of gelatine up to the light it can be readily determined which of the two has a superior color and clarity and which is freer from suspended matter an sediment.

There is one very important test which we somehow o other neglected to mention in our letter of the 22nd, an which we want to speak about, that is, decomposition. Gela tines in a jellied state should stand at room temperature an the action of the two samples watched closely. If either sam ple liquifies under five days, that particular sample is hig in bacteria and should be graded accordingly. A good gela tine will stand from five days to three weeks without liquify ing. This bacteria content or decomposition test is bein continually given more consideration and, in our opinion, i a most vital question. We see no excuse for any ice crea manufacturer introducing into his mix a surplus amount o bacteria. You even find an ice cream maker who says h doesn't care how many bacteria his gelatine contains be cause he pasteurizes and pasteurization kills bacteria. Thi is true to a certain extent, but not altogether.

We hope we have made ourselves clear and that the in formation as given you is what you want.

* * *

It is rather difficult for the ice cream manufacturers, o those not thoroughly acquainted with the various properties kinds, and qualities of gelatine to judge them correctly i small physical tests. At the same time, it has, and is bein done by a good many, and I suppose as time goes on th older buyers in the business will do more or less of it, an very properly so, where they employ chemists.

The first essential, of course, is the matter of determinin the strength of the product. This is best done by dissolvin one part of gelatine in eight parts of water, heating it to temperature of 160 degrees, and then allow it to jell in natural room temperature preferably over-night, putting i in a room where a temperature of 65 or 70 degrees prevails To set the gelatine in an ice box or cooler in a low tempera ture affects the setting properties in a way that they ar very apt to be misleading when you come to test them fo jelly strength.

In making a test of this kind, very accurate weights an measures must be used if a correct determination is to b made. Nothing short of delicate chemical scales will suffic for weighing the gelatine. An accurate measurement of th water must also be made.

After determining the relative strength, the clarificatio of the product should be given consideration. Determine i the product has been properly processed to eliminate an foreign substances in the shape of floating particles, or whic may show in the way of sediment in the bottom of the glasse (these glasses, by the way, should be what are known a Chemist's Beakers, of very nice, thin glass, without color)

The matter of odor is a very material factor, and to get correct idea of it, after the jelly strength has been ascer tained, the gelatine should be re-heated to a temperature o 160 degrees, and when at that heat, pour it out of the tum bler, when the arising steam carries a true indication of th odors that may be in the product. Where they are so pro nounced as to be objectionable, it is a very clear indicatio that the gelatine, itself, will carry more or less of an objec tionable taste, which can hardly be hidden by any amoun of syrups or flavors. Such objectionable odor and taste is a indication that the product is not as wholesome for foo purposes as it might be, and not as desirable or economica to use, for it costs additional money for flavors to offset poorly conditioned gelatine.

Whether a gelatine is neutral, alkaline, or acid, is a ma terial point.

Whether it is alkaline or acid can be determined by th use of litmus paper. A neutral gelatine is unquestionabl the most desirable. An excess of acid has been known t cause considerable trouble, when used in the making of ic cream, so that gelatine that is neutral or tending to alka linity would be the one, probably, more nearly meeting th needs of the ice cream manufacturer.

These are the cardinal points to be determined in makin physical tests of gelatine, and about all the ice cream ma can do, until he gets around to using the product in a prac tical way, which in the final analysis tells the real story o the properties contained in the different makes of gelatine

A gelatine may show to have good strength, and still i working it out in a practical way, its stabilizing qualities fo

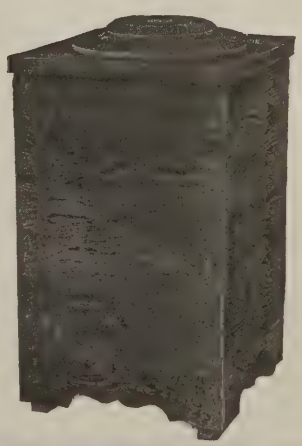
NELSON (Patented) Ice Cream Cabinets

"CONFESSED THE BEST WHEN PUT TO TEST"

42 Quart Brick with Ice Rail
Patented Nov. 11, 1919 1321120

are constructed along scientific and practical lines to conserve ice and salt supplies and keep the ice cream in perfect condition until sold. The manufacturers have devoted thirty years of study and experiment toward the building of the best possible ice cream cabinets for the manufacturing trade. Each particular make of cabinet of the Nelson line is sold with a guarantee and on a plan of "You Must Be Satisfied."

Brick Cabinet
Also for Eskimo Pies



This Proposition Will Interest You

Any responsible ice cream manufacturer—particularly wholesale ice cream manufacturers and dealers — may order from 1 to 100 Nelson patented Ice Cream Cabinets, place them in practical use, and after 30 days, if not entirely satisfactory, return at our expense for freight, both ways.

Can any manufacturer offer a more liberal or fair proposition? You owe it to yourself to thoroughly investigate the price, merits and construction of the Nelson Patented Ice Cream Cabinets before making any further purchase.

Three Compartment Cabinet

C. NELSON MANUFACTURING COMPANY

2308 Division Street
St. Louis, Missouri

ice cream may not be so desirable as another one of possibly a little less jelly power, but of higher refinement, and carrying all the essential properties for the making of ice cream.

The uniformity and standardization of the product a man is going to buy should have material weight with him in determining his purchasing, because it isn't possible for him in practical working to vary the amount of gelatine used in each batch, if the gelatine isn't of perfect standardization not only in the individual barrel, but in every barrel he may use throughout the year.

The ice cream men are spending a great deal of time and money to standardize their solids and other properties in ice cream, but if their gelatine is not equally as accurate in all its measurements, their finished product cannot be uniform or consistent in its body and texture.

To make an accurate test in the practical working of gelatine, it should be used down to a point in the batch where it won't do the work, so as to determine the minimum quantity that will give satisfactory results in the finished ice cream. This will be found to vary considerably between the different makes, and is the only way to accurately determine the cost of the gelatine per gallon of ice cream.

* * *

Mix the gelatine in the proportion of fifty parts of cold water to one part of gelation. Allow to stand until the gelatine has taken up all the water it will, which it should do in an hour's time; then heat over a water bath, stirring until all of the gelatine is thoroughly dissolved.

Allow this to stand over night, and if the jelly is reasonably firm the next morning at room temperature, it is sufficiently strong for ice cream use.

If a comparative test is made of several gelatines in this manner, great care should be used in the weighing of the gelatine and the measuring of the water, in order that each test may contain exactly the same amount of gelatine and water. The firmest jelly under this test is naturally the strongest gelatine.

* * *

This is an incomplete test, in our opinion, because it does not bring out one of the qualities in the gelatine which we consider plays a very important part in its use in ice cream.

The practical test is to use the gelatine in the ice cream mix in the regular course of manufacture, allow the ice cream to stand in the hardening room for about a week, and then place in a cabinet and ice daily. At the end of a week in the cabinet, the amount of shrinkage and the condition of the ice cream as to smoothness may be determined.

E. O. HANSON NOW VANDER BIE ICE CREAM COMPANY MANAGER.

E. O. Hanson, until recently assistant manager of the Creamery Package Mfg. Company, Minneapolis, has resigned to become Sales Manager of the J. C. Vander Bie Company Inc., of St. Paul, one of the biggest ice cream concerns in the Northwest.

Mr. Hanson has established a wide acquaintance in the trade, not only through representing the creamery supply company, but also through his connection with the Minneapolis Dairy School as inspector in testing.

Executives of the Creamery Package Company express regret at losing Mr. Hanson's services, but feel confident that he will be successful in the new work he is undertaking, and their best wishes to that effect follow him.

MOORES AND ROSS COMPANY MOVES INTO NEW PLANT.

On July 1st Moores and Ross, distributors of sweet milk, cream and buttermilk, and manufacturers of butter and ice cream, moved into their new plant at Zanesville, Ohio. They will occupy their new factory, which has been building since last August.

The factory is entirely of brick and concrete, and has a capacity of about 200,000 gallons of ice cream a year. They are using Miller freezers and a Vilter Ice Machine of 30 tons capacity.

This plant is a branch of the Crane Ohio Ice Cream Company of Columbus.

SUCCESSFUL ICE CREAM MEN BOOST NATIONAL EXPOSITION.

Value to the Industry of Shows and Conventions Related by Men They Have Helped.

Two of the most successful ice cream manufacturer in the country have gone on record as to the great valu to the ice cream industry of shows and conventions, wit particular reference to the National Exposition bein promoted by The Association of Ice Cream Supply me and to be held in Cleveland in conjunction with the 22n annual convention of the National Association of Ic Cream Manufacturers, October 17th to 21st, inclusive.

One of these ice cream manufacturers, W. M. E Sire, general manager of the Imperial Ice Cream Com pany, of Clarksburg, W. Va., which has plants in man other cities in West Virginia and adjoining states, ha written to The Association of Ice Cream Supply Men:

"What we think of the value of the National Show is illustrated by our sending all of our managers to ever show for the last five years, excepting Portland.

"We had twenty-one men at Minneapolis last fall and will probably have thirty from our seventeen plant at Cleveland this year, and we will receive large divi dends from every cent of expense in sending these boy up there, too. We figure conventions mean a lot mor to us than we do to them by our attendance.

"Not only the managers go, but the heads of depart ments, such as the ice cream makers, mixers, even th accountant and purchasing agent, because of the ne methods brought out and new equipment and machiner to be seen, and not the least is the good derived fro meeting the manufacturers from other sections and talk ing over each other's problems.

"We have in our plants, our system and our methods many ideas secured at these various conventions.

"We have plants selling as low as 50,000 gallons o ice cream up to 500,000 gallons, and in my opinion thes conventions contribute much towards making 50,000 gal lon plants grow into the 500,000 class as they absorb en thusiasm and ambition at the national and various stat shows."

Another highly successful ice cream manufacture L. M. Hendler, head of the Hendler Creamery Company of Baltimore, Md., has sent the following letter to th Association:

"It would fill a book to write all the benefits I hav derived from attending the ice cream shows and con ventions. I absolutely attribute my entire success t the knowledge attained at these meetings. I still no only attend all of the National Supply Men's Shows, bu nearly every state convention that is within reachin distance and never do I leave one that I do not brin back a valuable little book filled with dollars.

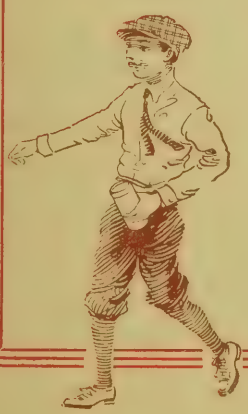
"It goes without saying, of course, that the ice crea show is as important to us as the convention, but no that the two are being held together, a fellow shoul borrow money, if he had to, to be in Cleveland durin that time."

The great National Exposition is to be held in th new $6,000,000 Public Hall in Cleveland, opening th second day of the National Association of Ice Crea Manufacturers' three day convention, October 16th t 18th, inclusive, and continuing through the 21st of O tober.

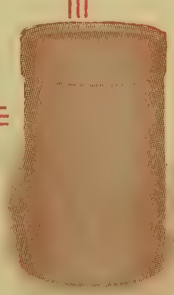
All but a very small percentage of the display spac in the exposition was reserved by members within a fe days following the issuance of floor diagrams.

more "Carry-Home" sales

There is no denying that most of us have been overlooking an important phase of our business—that of attracting, developing and holding a bigger carry-home trade from our retailers. Bulk ice cream is the preference, we all know. It is, therefore, up to the industry to provide a more practical distribution method for bulk ice cream than the present unsatisfactory method. We must find a way to keep bulk ice cream in perfect condition from the retailer to the homes.



remarks made by an ice cream manufacturer before he knew about the "Sealright-Way"--



The "Sealright-Way"

IN 44 states, now, the packaging of Bulk Ice Cream, the "Sealright-Way", is the happy solution. It is practical, sanitary, efficient, economical and highly satisfactory. It has won enthusiastic cooperation from dealers and spontaneous favor from consumers. Wherever adopted and efficiently carried out by ice cream manufacturers and retailers, and properly brought to consumer attention, the "Sealright-Way" has not only increased "carry-home" sales, but has stabilized these sales. So favorably is the method regarded, that the idea of carrying ice cream home is now quite the "proper thing to do." Our Portfolio, the "Sealright-Way," covers the whole proposition pretty thoroughly.

Ask us about it.

Mojonnier Bros. Company,
739 W. Jackson Blvd.,
Chicago, Ill.

Gentlemen:- Attention Mr. J. J. Mojonnier.

We have been using your ice cream packaging machine, since July, 1921, and we have been making all of our brick ice cream by your method from that time. We feel that with the new liner, and the improvements that you have made upon your present machine that you have absolutely solved the problem of packaging ice cream directly into the carton. Our brick business is now greater than it ever has been, and is on the increase. We attribute this largely to the splendid package that we are enabled to put out with our machine. Every quart is a full quart. The bricks do not rattle in our package. The cream is of far better texture and more like bulk cream than our brick cream made by the old method. The lines on the three flavored bricks are always much better than we were ever able to make by hand.

We believe that one of the finest features of ice cream packaged in this way is that the cream is hermetically sealed upon all six sides in pure vegetable parchment from the time it leaves the freezer until it is opened in the consumer's home.

We would not think of ever going back to the old method of packaging ice cream.

We recommend your machine with great pleasure.

Very truly yours,
LAWRENCE ICE CREAM COMPANY,
By [signature]
President.

LBO:MS

NEW ORLEANS ICE CREAM CO
Velvet ICE CREAM
1520 to 1530 BARONNE STREET
NEW ORLEANS, LA. May 16, 1922.

The Purity Paper Vessels Company,
4 East Fayette Street,
Baltimore, Md.

Gentlemen.-

Replying to your letter of the 8th, we have been using Mojonnier Automatic Packaging Machine for the past six months. We believe it to be the best on the market at the present time and so would not be without it.

Mojonnier Brothers are making improvements on this machine from time to time and it would seem that the time is not far distant when this machine will be everything that can be asked for. We are packaging around three hundred gallons per day. The cartons are better filled, the flavor more even and in every respect the ice cream is much better when handled by their cutting, and wrapping. From our figures in slabs, then cutting, and wrapping. From our experience, we would not hesitate to recommend the Mojonnier machine to any one needing equipment of this character. We have been doing business with Mojonnier Brothers Company, who are men of the very highest business integrity, for several years and all our dealings have been most satisfactory. You can rely on any thing they tell you and they positively stand behind any piece of equipment that they manufacture.

Trusting this is the information that you desire, we are

Yours very truly,
NEW ORLEANS ICE CREAM COMPANY.
President.

M & G COMPANY
M & G ICE-CREAM
EXECUTIVE OFFICES ALLENTOWN, PA.

Tamaqua, Pa., June 18, 1922.

Mojonnier Bros. Co.,
739 West Jackson Blvd.,
Chicago, Ill.

Dear Sirs- Attention Mr. Timothy Mojonnier.

It gives me pleasure to recommend to other users of your machine its particular advantages and uniqueness. We have found that the packaging machine has been an advertising medium for us, and with the well-filled packages turned out by it, we have been able to get certain new trade which we probably could not have gotten had it not been for this sanitary package.

We find the machine easy to operate, and also unusual care or any great amount of repairs. Its finish or usefulness covers a long felt need in the matter of placing before the public a small, sanitary package at a reasonable cost. Besides, the package is not limited to the quart size only, but to any prices smaller than that, even down to one seventh of a quart.

We feel that during the dull season in particular that we will be able to hold our sales through its use better than heretofore.

Very truly yours,
M & G COMPANY

"Just The Thing We Need!"

MATOT EVER-KEEP PACKAGE CREAM FREEZER

Why?

Because—

Packaged cream of any selected flavor is instantly dispensed right from the coldest part of the freezer—no fumbling around for the flavor wanted.

The oldest cream is always dispensed first.

Zero temperature—no soft cream.

Keeps cream in perfect condition—a valuable asset for increasing the carry home trade.

Freezer accommodates packaged cream in any form—bricks, eskimo pies, cylindrical packages in quarts, pints, etc. Where necessary special size containers are made.

Cream container proper consists of a centrally located receptacle surrounded by ice on all four sides, top and bottom, and is arranged to provide individual compartments for cream of various flavors.

We guarantee these Ever-Keep Freezers if iced properly once in 24 to 36 hours to keep cream in most perfect shape.

Ever-Keep Freezers are carried in stock in 32, 40, 48, 56, 60 and 70 quart capacity.

Patented Jan. 24, 1922

A full line of non-equaled ice cream cabinets, corkboard insulation, metal lined, Everlasting Redwood exteriors carried in stock in all sizes. Stock finish is golden oak. Can be furnished in mahogany, white enameled or any other finish desired.

"PROSPERITY" TRAINLOAD SHIPMENT OF CHOCOLATE CONTAINING OVER A MILLION POUNDS.

The best evidence of the present state of business, is the fact that the Stollwerck Chocolate Company from their large plant at Stamford, Conn., have made shipment on July first of a trainload of 30 cars of chocolate to their various customers throughout the States.

They are justly proud of calling this the "Chocolate Prosperity Train," and as far as we know this is the first trainload shipment of Chocolate made at any time in the history of the chocolate industry.

This trainload leaving the factory at Stamford, Conn., made a fine showing, the New Haven Railroad co-operating with the company in giving them all new cars, and on each car was a banner giving the name of the customer to whom the carload was being shipped.

This train is moving over the Pennsylvania Railroad during daylight, so as to give the benefit of this unusual sight of a trainload of chocolate being shipped, to as many people as possible, the train moving through the principal eastern and western cities.

The following well known firms are participating in this train movement, each one of them receiving a full car of Chocolate:

The Reinhart & Newton Company, Cincinnati, O.
Brux Candy Company, Newark, Ohio.
Sauerston & Brown, Cincinnati, Ohio.
The Dolly Varden Chocolate Company, Cincinnati, O.
A. R. Walker Candy Corp., Muskegon, Michigan.
C. S. Ball Candy Company, Dayton, Ohio.
Crystal Ice Cream Company, Portland, Oregon.
True Blue Biscuit Company, Portland, Oregon.
American Candy Company, Milwaukee, Wisconsin.
Griggs Cooper & Company, St. Paul, Minnesota.
Minnehaha Candy Company, Sioux Falls, South Dakota.
Johnson Biscuit Company, Sioux City, Iowa.
Brecht Candy Company, Denver, Colorado.
The W. T. Rawleigh Company, Freeport, Illinois.
The Savage Candy Company, Denver, Colorado.
Walter T. Hall & Company, Ottumwa, Iowa.
Sioux Candy Company, Sioux City, Iowa.
P. S. Hessler Merc. Company, Denver, Colorado.
The W. C. Nevin Candy Company, Denver, Colorado.
Gurley Candy Company, Minneapolis, Minnesota.
The Bonita Company, Fond du Lac, Wisconsin.
The Jos. B. Funke Company, La Crosse, Wisconsin.
O. P. Baur, Confectionery Company, Denver, Colorado.
United Bakers Supply Company, St. Louis, Missouri.
McCollum Brothers, Galesburg, Illinois.
Douglas Candy Company, St. Joseph, Missouri.
The Gardner & Gould Company, Burlington, Iowa.
The Brandt Company, Cleveland, Ohio.

PUYALLUP ICE CREAM CO. HAS NEW SOURCE OF RAW MATERIAL.

The Buckley Products Company, Buckley, Wash., is now in full operation. The plant is receiving several thousand pounds of milk daily which is prepared and shipped to Puyallup, to the Puyallup Ice Cream Company. Mr. Robb, proprietor of the Puyallup Ice Cream Co., is also proprietor of the new company. George Etsell, of Bellingham, Wash., is local manager of the plant. Both men are experienced in their business.

The building and machinery of the Buckley Products Company represents an expenditure of about $20,000, and is thoroughly modern in every way. The building for the plant was constructed by the Buckley Improvement Company. It is equipped for the manufacture of butter and with a refrigeration and ice plant, the ice being used both to pack ice cream and for commercial distribution.

California and Southwestern States Ice Cream Mfrs' Ass'n

Proceedings of Seventh Annual Convention, Held in Stockton, California

(Concluded from June issue)

NEW IDEAS AND PRACTICES IN THE ICE CREAM INDUSTRY.

By Mr. F. E. Miller.

Mr. Miller: Ladies and gentlemen, I enjoyed Prof. Turnbow's paper. You recall last year he gave us some very interesting things that will be of material help to our industry and particularly I enjoyed the fact that the convention discussed his paper because he has had some papers here that were interesting but some way or another our meeting did not mix it like it has today and I think you will agree that we are having a very fine meeting today and one that is very helpful.

The subject I have, "New Ideas and New Practices in the Ice Cream Industry," is something that is interesting to us because if we are to advance and grow we must continue to go after these things. Some of them involve the chemistry of our product and some of them involve the new mixes. We are all striving for bigger and better things and we must advance mechanically and learn more about the chemistry. I have in mind the subject of vitimines and that is to me a large subject, and I hope some day we will have that on the program. If we are to put our product on as a food product we have to know more about these vitimines. I wish we could have the benefit of Prof. Turnbow to tell us more about vitimines, and whether when we pasteurize our mix whether we kill these little vitimines. If we tell the mother to feed her children ice cream, that it is a food product, if they find that any of these vitimines are killed through pasteurization, it would be well for us to do it some other way, because to my mind, that is one of the things that will make our business grow. I have most of my remarks on paper. Some say the silent partner is responsible for this paper, but I leave it to you.

Often I visualize the ice cream business through the same mental glasses by which I view the progress of electricity and the conquest of the air. Great as we may consider their development, all are yet in their infancy.

The ice cream man cannot help being carried away with enthusiasm when he takes time to consider the almost limitless possibilities of our business. We have as yet hardly scratched the surface of our opportunities. True we have made some progress along mechanical lines, but as to essentials, are they not much the same as they were, say ten years ago? Sometimes I am lead to peer into the future of our business and I see ideal conditions. One thought generates others and forces comparison between such ideals and the system that now prevails.

You may well ask for the details of such a happy future as I mention.

Truly we have not made rapid or radical advance. I read recently that in the time of Nero artificial refrigeration was produced with ice and salt; so it is today. At our last national convention at Minneapolis the statement was made that the last five years have seen the greatest progress and usefulness of our business. The remark referred to certain improvements in delivery trucks and cabinets. Too often we do follow the rule of thumb methods and show a positive cowardice toward the adoption of new ideas and new mechanical appliances. While we are not in the horse-car period of our development it must be admitted that we are not on a par in progress with the latest motor car that can fly a hundred miles an hour.

I do not believe I am visionary in giving it as my belief that in the not very distant future ice cream will be produced much more efficiently and economically than by our present freezer methods. My enthusiasm impels me to say so. New methods will come because they will be demanded by the growth of our business and for increased economy in production. The world's chemists will doubtless astonish us before long by innovations of which we have no idea at this time. It is impossible for any branch of industry to stand still in these epochial times.

Let's be explicit. Our brine freezers are larger than they were ten years ago, but has there been any othr sign of advance? And is not the same true of most all of the branches of our business?

We have but two things to sell, ice cream and service. Speaking broadly the service costs almost as much as the raw material. Does not such a condition call for strenuous effort to bring about a change? What other

The small ice cream maker grins, and the large manufacturer chuckles. They both use *VISCO* in their mix. Read about this latest application of science to your industry.

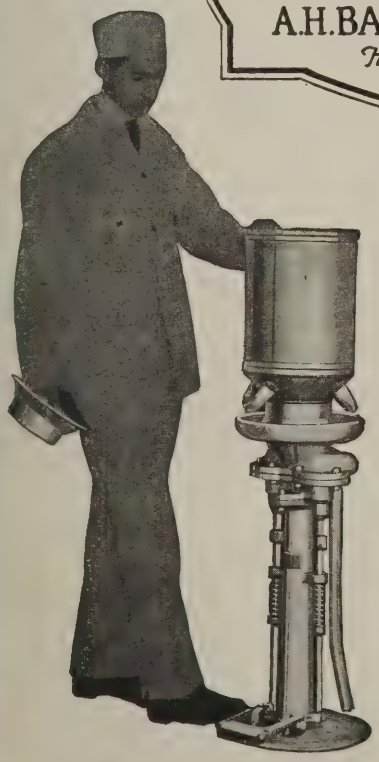
Foot-Power Filler

Sealright—a Practical Filling Machine for the Round Container

The Sealright Filler, with the Sealright Containers, forms the finest combination on the market for speedy and thoroughly satisfactory work. The machine is compact and fits in anywhere. It automatically packs bulk ice cream in one or or more flavors without the necessity of the cream being touched by hands. Bulk cream in packages is what the people want. Be a leader in your community and win popular favor by supplying bulk cream in the Sealright Package.

Sealright Containers

appeal to the ice cream buyer, for their carrying and keeping qualities, and because they do away with the mussy, unsatisfactory method of unwrapping and slicing the usual brick. And more important still, they protect the dealer against loss by measuring the cream accurately—four quarts from every gallon, instead of the shortage that always results where bulging paper pails are used.



BARBER

IF you want to keep closely in touch with the latest developments in equipment and supplies for your business, you have only to keep your name on the Barber mailing list. As large distributors, we keep fully informed on new machinery and improvements brought out by the various manufacturers, and the things which are practical and worth-while are quickly passed along to our customers. This, with our Chicago and St. Paul locations, and our excellent shipping facilities, is a great convenience and valuable to the dairy industry throughout the Middle West.

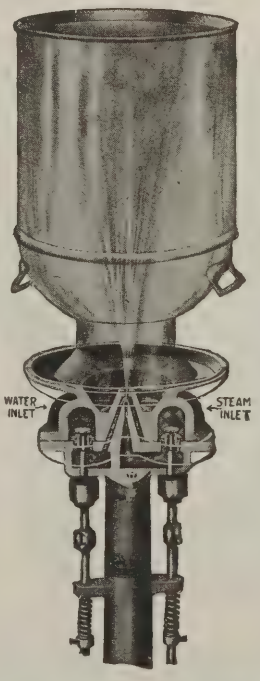
Danforth Jet Rinser and Sterilizer



A can steamer, to be satisfactory, must be fast—thorough—and convenient in operation.

The Danforth steam jet is located directly beneath the orifice. The action of the jet breaks the water into a fine spray and greatly accelerates its speed. The water is heated by the steam as it passes through the ejector.

Note the convenient operation of the valves directing the water and steam. A flexible foot tread, simply by moving the ball of the foot one inch to the right, shifts from water spray to live steam. The rinsing is instantly followed by sterilizing. Nothing could be speedier or more convenient. The hands of the operator are left free to hold the can.

It is low enough in price to make it practical for the smallest plant—large enough in capacity to meet the needs of the plant handling 300 cans per day. A thoroughly practical and dependable piece of equipment at a moderate cost.

Price, painted gray, $45; galvanized, $50

IT IS EASIER TO GIVE ADVICE THAN TO LEND A HAND.

business shows such a record? I am enthusiastic enough to say that before another five years has passed we shall laugh with incredulity at the expensive, wasteful, amateurish methods we use today.

Already the light has broken in with the refrigerator truck. While not filling all the long-felt want this form of delivery truck is a step ahead and will certainly be perfected in the near future. We are also at work on the refrigerator cabinet. Both are prime necessities if we are to popularize ice cream as it deserves. At every stage of the business we must regard our trade as one that is in its infancy and that calls for all possible initiative and research.

It must have occurred to many of you, as it has to me, that we are yet following a very primitive, expensive method in the preparation of ice cream bricks, and in the packaging of our product. To get my idea before you, let me draw a comparison. But a few years ago the milk man distributed his product from cans on his wagon direct into the pitcher of the housewife. Compared to the complete sanitary system of distributing milk today, and with which you are all familiar, the old method is seen to be not only repulsive, but unreliable.

Why not similar progress in the handling of ice cream? Our present method of preparing brick is cumbersome and wasteful. We have now machines that eliminate three or four operations and prepare a three-layer brick direct from the freezer into the original carton. This machine will fill a long felt want and will complete a link in the sanitary manufacture of ice cream.

This same method of packaging could be followed in the ice cream now sold in bulk to dealers. Instead of spooning out ice crea min a grocery store from a cabinet which might have a dusty sack of potatoes or a bundle of corn brooms alongside of it, how much more sanitary, and attractive to the customer, to have the ice cream already packaged and sealed without possibility of dust and flies. Such a method would do much to popularize ice cream as a food and would commend it to the grocer with greater force than the lower method of spooning from a can.

These last remarks of mine have a direct bearing on another angle of our business which is calling for the closest attention. I refer to the manner in which our very moderate profits are decreased because of the large amount of responsibility we take off the dealer's shoulders. As it is, we not only sell him our product at a close margin, but we guarantee him against all loss, we keep the goods in perfect condition for him and it has become customary for him to expect us to supply him with expensive signs, to decorate his store and to create trade by generous advertising. If these things are to be done, we must, for our own protection take advantage of every device for lessening the cost of production, and we must make concerted effort to increase the volume of business.

It will be admitted that there is much yet to add to our knowledge of the chemistry of milk and cream. More recently we have heard much of the value and virtues fo vitimines in milk. Yet no one has been able to give us a definition of vitimines or to tell us what they are. If they possess the valuable qualities attributed to them we ought to use this knowledge in creating new interest in our product.

With a great part of the world ice cream is still a luxury. It is our duty to convince that it is primarily a food, a health and body builder. When we have done that the ice cream man will be in the same category as the baker and the butcher, and that is where he belongs.

But while the chemists and scientists and mechanicians are struggling with the problems of ice cream making and service so far as they can, let us look at some of the other angles of our game. Let us look into the heart of our business organization and see if we are doing everything possible to promote personal efficiency in every member of our business family. This I regard as essential to success. A satisfied, harmonious organization with every unit working toward a common purpose and feeling that a definite part of the responsibility of the business rests on each one is a big asset. Such condition promotes economy, stimulates good service, makes for good will wih customers and adds to profits. Without in any way making a sacrifice to discipline, I make every employee feel that I am interested in them beyond the mere need of service thy shall render for so much pay. I believe in maintaining a democratic bond, but not an autocratic one, between employer and employees.

I am a firm believer in co-operation among men in the same line of business. The exchange of experience that is made possible at conventions is very valuable and instructive. We should not only have a state, but also sectional organizations within the state for the protection and development of business. The highways of California have tied us together and have made possible service to hundreds of smaller markets hitherto inaccessible for our product beyond a limited time. From each other we can gather information as to transportation that will be of marked value. We should regard it as a duty to attend our conventions and to co-operate in every way possible. The coming changes in our business will make co-operation more necessary than ever. We should be able to obtain information as to milk supplies from all parts of the state if we organize along intelligent lines. I can see how many benefits that will

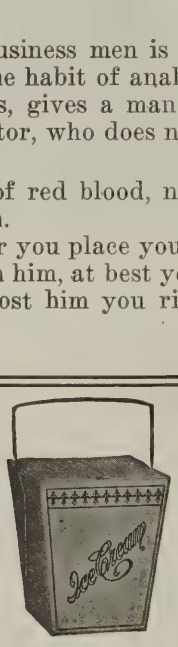
follow co-operation among us and I counsel the closest of relationship among the members of the trade. This would help to maintain the ethics of our industry, an obligation that is very necessary. This feature of our industry is that which closely reaches the public and dominates the degree of respect with which our business is regarded. In all our advertising there should be that note that will inspire confidence in our business and anything apart from this is disastrous.

I feel more than ever the basic truth of my opening remarks that we have not as yet broken ground for the great strides that our industry is destined to make in the near future. People are not eating half as much ice cream as they should, or as they would if they but knew its real value. This statement perhaps sounds commonplace, but it is not. I am confident that the future progress of our product may be compared to that of the auto vehicle. And what has done it for the auto? Persistent improving and persistent advertising. The same elements will win for us and in the same measure.

So far I have confined my remarks to what might be called the physical aspects of our business. But work as hard as we will, we must also think.

Henry Ford says, "My advice to business men is to read a lot, think a lot, work a lot." The habit of analysis—to get under the surface of things, gives a man a tremendous advantage over his competitor, who does not do likewise.



The industry to-day calls for men of red blood, not of white livers, men of grit, not grouch.

If you seek to injure your competitor you place yourself below him, if you take revenge upon him, at best you simply even up matters, but if you boost him you rise above him.

Although a super-optimist, I am impelled to say, from a long experience, that there is no royal road to success in the ice cream business,—the elevator to success is no running; you should take the stairs. Often we will ascend three or four steps and slip back one. But that is real progress, real cause for encouragement.

There is a point of contact between us, or there should be, other than that of ice cream manufacturers. I take it that the purpose and virtue of organization includes the incubation and nurturing of a man-to-man, a fraternal bond which suggests that the success of one is cause for mutual congratulation and the injury to one is the concern of all. The development in our business during the past few years and the tremendous opportunities now unfolding, invest in us a responsibility to the public which is growing daily.

As individuals, as well as through our organization we must do everything to establish public confidence in our business, and we must do nothing to shake it.

If the practices and principles which I have attempted to bring before you are put into practice I know of nothing that can keep you from building the ladder on which you rise, "From the lowly earth to the vaulted skies."

The President: Does anyone have any questions to ask Mr. Miller, or is there any discussion on the subject?

If there is no discussion on Mr. Miller's paper, Prof. Turnbow would like to know the pleasure of the manufacturers on how they would like the names on the scores of the ice cream, or do they want to keep it secret or make them public? He wants to know now so he can prepare. I think that is usually announced at the close of the round table this afternoon.

Prof. Turnbow: The result will be ready by one o'clock, and at that time I would like to know which way it is to be put on. The cards are to be posted above each container. Will I put the name or the number on the score? It is just so I can follow out the wish of the association.

The President: We will talk it over a little among ourselves and give you the instructions on that in the early afternoon.

Prof. Turnbow: All right, I will appreciate that.

The President: We will decide after we have talked it over a little.

At the close of the morning session, all members and visitors will go to the roof garden on the second floor where they want to take a group picture there so that our publicity committee can give proper publicity. Mr. Kugler wants this information.

The President: The next number on our program this morning is "Color in Ice Cream; Its Limitations and Abuse," by Mr. E. W. Morrison.

* * *

"COLOR IN ICE CREAM; ITS LIMITATIONS AND ABUSE."

By E. W. Morrison.

Mr. Morrison: Ladies and Gentlemen: When we look at the ice cream score card adopted by the University of California, we see at the head of the list, appearance and palatability, with the word appearance followed in parenthesis by the word "color," meaning that they are practically synonomous. Hence I consider the subject now to be discussed an important one.

Coloring is only a small step in the process of manufacturing ice cream. For this reason, importance of color in ice cream is apt to be underestimated. Ingredients, composition, methods of processing and standardi-

Getting People to Use More Ice Cream at Home

By C. W. ESMOND, of The Frederick C. Mathews Co., Before Ohio Ice Cream Manufacturer's Assn.

There is no doubt but that we can all agree with the manufacturer, who made this remark to me a short time ago. He said: "It pleases me immensely to see people patronizing the soda fountain and eating sodas, sundaes and cones. As I see this, there also flashes into my mind the vision of my freezers running full time and a steady stream of deliveries leaving my factory. but if there is anything I like better, it is to see men, women and children coming into the store and buying it in pints and quarts to take home. This is the class of business that runs into gallonage for me. Money spent in this way by the consumer buys much more ice cream than if spent the other way. Yet it doesn't lessen the fountain trade, for the more people eat the more they want. Beyond that, is the vital fact that this demand continues in bad weather as well as in good. It maintains the output when I most want the business. It stabilizes the demand more evenly throughout the year, and by helping me to make ends meet in the cold months, conserves and increases very greatly my profits for the whole year. In it lies the greatest future development ofthe ice cream business."

C. W. ESMOND.

Agreeing, as I believe we all do with the sentiments of this manufacturer, let us visit a few stores in various parts of the United States and Canada, that are exceptionally successful in selling ice cream for people to use at home.

Take my friend, Ainsworth, for instance. He runs a little corner store in a city of 60,000 people in the northwest. It is one of those handy places where people drop in to get what they forgot to order from down town, but no customer ever gets out of that store without Ainsworth suggesting ice cream to her in such an attractive way, that she seldom resists the temptation to buy. He talks about it, tells people about it at every opportunity and gets a volume of sale that is the largest of any store in the city. Salesmanship, suggestion, or whatever you like to call it, is the secret. He is enthusiastic and he talks because he realizes ice cream to be the most profitable line he can push—no capital tied up in stock—stock turning every day.

Now, for a change we will call on Vic Krummenacker of St. Louis. He does not think that there is anything remarkable about anything he has done. But, just the same, in his little corner drug store way out in the suburbs, he sells more bricks than probably any other store in St. Louis. Every parcel that goes out of his store carries in it a piece of advertising matter, suggesting bricks. The effect of this is intensified by his talking about it at every opportunity to customers who come into the store. He keeps it in front of them perpetually, and backs up his aggressive selling by giving a dependable delivery service and high quality goods.

A different type is King, of Hamilton, Ontario. His unique way of getting people to use more ice cream at home and to get people to talk about him is by giving the housewife new ideas about how to serve ice cream at home. Mrs. Jones, for instance, comes in this afternoon to get a quart or two for an afternoon tea she is having. When she has decided on the quantity and kind she wants, King asks her if she wouldn't like to serve it as a sundae or a parfait. This always appeals to her and she wants to know how to do it. He tells her and sells her some fruit or a syrup to serve with it.

Then he begins to have telephone calls like the following: "I had some of your ice cream at Mrs. Jones' tea the other afternoon, most beautifully served. I am going to have a tea tomorrow afternoon and I would like to have you supply the cream and tell me how to serve it." These calls come from a great many different parts of the city, and usually from people King has never seen or heard of before. In this way the helpful suggestions he gives are both making people use a great deal more ice cream and constantly getting him acquainted with new people he has never met before.

Smith of Salt Lake City has a little corner grocery. This is a store of convenience for the neighborhood. He sells a large volume of quarts and pints by getting it to the people regularly at a certain time every day. He has two boys who work with him after school. These boys start out with a wagon and a packer full of bricks and go from door to door. The housewives buy the bricks, wrap them up in newspaper, so that they will keep till supper time, and the boys very quickly get rid of their stock of bricks. The housewives have gotten so they can depend on getting ice cream at a certain time every day, and they make it their regular dessert three or four times a week. Being able to depend on it in this way, gets them out of the habit of making desserts, and it has immensely increased his sales in his own neighborhood.

Another exceptional ice cream merchant is J. A. Far-

ST. LOUIS, MO.

rell, of Cincinnati. His sales of ice cream in the winter, for instance, average around 500 gallons per month, as

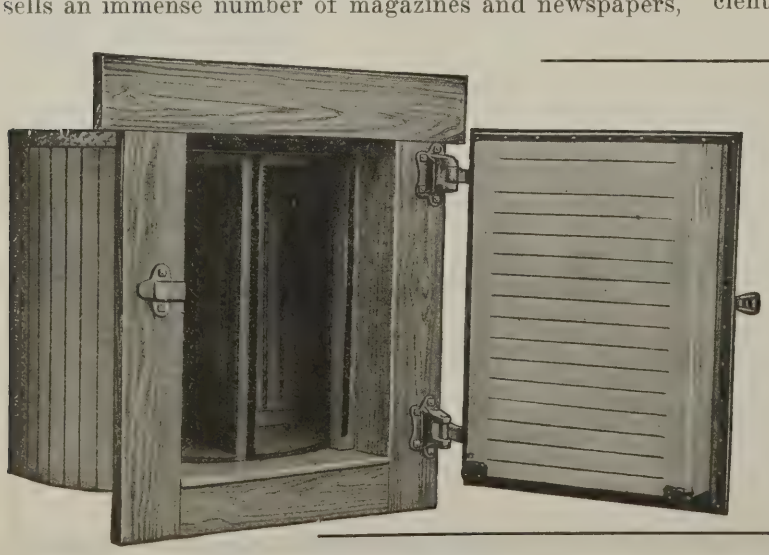
Charging a fair price is one of his basic policies. compared with sales of 1,000 to 1,200 gallons per month in July and August.

Charging a fair price is one of his basic policies. When other people were charging 60 cents for quart bricks last spring, he reduced his price to 50 cents. But the method paid him, because he got people talking about him, and his volume of sales increased immensely. He believes in moderate profits and quick turn over. If you once go into his store you are his friend forever. He has a cheery word for everybody and a genial Irish way, that compels you to like him. Before you know it, he is talking ice cream to you and is showing an ice cream brick that you likely buy before you get away from the store.

He will take a loss any time in order to make a friend. For instance, a society in his neighborhood that purchased ice cream for a social evening from somebody else, ran short during the evening and needed an additional 18 gallons. They phoned Mr. Farrell in their emergency, and he got a truck and got the ice cream to them in less than twenty minutes. Another time a church organization, which bought their cream from another source, had some left over. They came to him and asked him if he could use the surplus. He promptly and pleasantly took the cream off their hands, though he realized he could not make a profit on it. But he did make a profit in a big way on the friendship he secured by doing this. It is never too much trouble for him to make a friend.

It is also a vital policy with him to constantly give the people something to talk about. One afternoon and evening he gave away about sixty dollars worth of ice cream in the form of sandwiches, at a nearby theatre. He says it looked foolish to give so much ice cream away, but that in less than a week he recovered this amount and more from the increased sale of sandwiches. For making sandwiches he cuts a quart brick in seven portions and serves the portions between chocolate wafers with a candied filling, at a price of 10 cents. This illustrates his policy of giving good value to the customer.

He is not merely content with reminding people of ice cream when they come into the store. He has a mailing list of approximately 4,000 homes and he writes letters and mails circulars to these homes regularly. He sells an immense number of magazines and newspapers, 3,000 copies weekly of one publication alone. During the winter, especially, he rubber stamps every publication that he sells, with a message about ice cream or some attractive specialty, that will tempt the appetite of every person who reads the paper or magazine. In the case of the Saturday Evening Post, for instance, he not only stamps the outside, but also stamps some of the inside pages. This gives him a tremendous mailing list at small cost. He delivers to homes, the customer paying for the cost of delivery, the nominal charge of 10 cents, which goes to the boy who brings the ice cream.



I have tried to give you a little word picture of these various dealers, believing that we may learn something of value from their methods. There are not a great many of this type to be found. These aggressive and enthusiastic business getters for ice cream are unfortunately very rare. But their example suggests some things of great value.

The first thought is that we industriously develop other dealers of this type. The second is that we apply certain of their methods in our selling program as manufacturers. How are we going to do this?

To develop aggressive dealers, how can we do better than to set them an example of enthusiastic, aggressive salesmanship ourselves, a salesmanship that reaches through them to the consumer in their own community right around their store, and demonstrate to the dealer in a direct way the possibilities and the profits of selling ice cream. Can we expect them to be keen, enthusiastic, and aggressive, if we ourselves go no further than to deliver ice cream to their store, put up a few signs, and talk to them in general terms about the profits that come from a large volume of quart and pint sales?

We cannot inspire our own hired salesmen to do their best work, unless we ourselves get out on the firing line from time to time and encourage them by our example. If we can't get results, except by example, with our own salesmen, who have only our own product to push, how can we expect results from dealers, who not only handle ice cream, but scores of other things, so many that ice cream is merely one detail of the business?

From seeing the results habitually secured by manufacturers in different cities, the conviction grows with me that the most effective way to get large increases in the sales of quarts and pints, is to consider each dealer as a salesman, representing us to the public, and to help him by example and by effective advertising matter that reaches the people he is interested in, to be a more efficient and enthusiastic salesman of our product. time we help him to sell more ice cream to the Mrs. Jones', Browns and Smiths around his store, we have not only increased our volume of sales by that amount, but we have also built some co-operation and salesmanship into our dealer, and demonstrated to him the possibility of making more money by putting thought and energy into the selling of ice cream, than he had ever dreamed was possible.

We have seen this plan of intensive work produce remarkable results in scores of localities in the past three years, and those results are encouraging numerous manufacturers to extend it on an increasing scale to dealers in every part of their territory.

They send to the consumers a list of whom has been supplied them by their dealers, attractive literature that makes the whole family hungry for ice cream, shows its food value, gives them ideas how to serve it in new and attractive ways, and above all stimulates and encourages the dealer himself, because it is reaching the people whom he has named and they talk to him about it. It is bringing orders into his store, so that he is encouraged to be active and aggressive himself, and sell many more orders by personal salesmanship.

Building up the individual sales of various dealers is, I believe, generally recognized as a far better method of increasing business, than that of going out and trying to get dealers away from the other fellow.

To make a 10-gallon-a-day dealer where there was a 5-gallon-a-day dealer before, almost cuts in two the cost of delivery, the cost of icing, the overhead on cabinets and similar expense.

It is increasingly evident that the successful manufacturer of ice cream is like the successful farmer, the man who cultivates every acre of his farm intensively to secure the best possible yield. Each dealer and his community are like a small field on the manufacturer's farms. A manufacturer not long ago remarked this to me: "My dealers are worth on the average about $75 per year, a piece, that is, my net profits on my year's business average about $75 per dealer. But if every dealer were working his territory, as it would pay him to work it, vigorously, intensively and aggressively, he would be worth to me not $75 but $100, or probably $125 or $150 per year, and he would at the same time be securing much greater proportional profits for himself.

I, therefore, feel that the very core of my problem is to develop my individual dealers, as merchants of ice cream, so that they reach a high standard of merchandising, and my business will prosper just in proportion as I help them develop."

Is not this, gentlemen, the real problem of getting people to use more ice cream at home? Is it not the problem of getting more and more of our dealers to be Farrells and Smiths and Kings and Krunnenackers? If it is, what are we doing about it?

SUPPLY SALESMEN WORKING FOR NATIONAL ASSOCIATION OF ICE CREAM MANUFACTURERS.

Members of the Salesman's Club of The Association of Ice Cream Supply Men have added to the description and analysis of their respective goods, always in the very nature of good salesmanship clear-cut in a salesman's mind, a number of equally clear-cut and significant "selling points" of the National Association of Ice Cream Manufacturers, and are making these points known throughout the country.

A recent bulletin of the Salesmen's Club summed up these "belling points" this way:

"It is due to the National Association that ice cream manufacturers anywhere and everywhere today are able to take profits from their businesses.

"The National Association absolutely saved the ice cream industry from suspension during the war.

"For years the National Association has come to the assistance of individual manufacturers menaced by discriminatory and unfair legislation.

"The National Association has saved the industry hundreds of thousands of dollars in express rates, and is constantly protecting the industry against unfair advances.

"The National Association has helped ferret out the cause of sandy ice cream. It has been responsible for sensible—as against fanatic—state butterfat standards.

"It issues bulletins of information for ice cream men.

"It will some day have an industrial laboratory working.

"Its president says to other ice cream manufacturers: 'The National Association of Ice Cream Manufacturers has literally saved your industry at least once. It has smoothed the way for it many other times. It holds the possibility of service just as reat during the coming year and the many years ahead. A member at its annual convention alone cannot fail to pick up information worth in dollars and cents many times the cost of membership. Big manufacturers and little manufacturers alike are profiting from its activities. It is the vehicle of general progress in our industry.' "

National Association of Ice Cream Manufacturers

Extracts from Report of Proceedings of the Twenty-first Annual Convention Held in the Hotel Radisson, Minneapolis, Minn., October 10, 1921

THE printed report or proceedings of the National Association convention was mailed out to the members on the 15th of May. Several of the addresses delivered at this convention have already been published in The Ice Cream Review. Those have not been previously published and other reports are printed on the following pages.

The Secretary's report shows a net gain in active membership of 70, the active membership on October 21st, 1922, being 572. Seven new associate members were secured during the years 1920-1921, over and above the number lost, making the total associate membership 108. The total state association membership on October 21st, 1921, was 29.

From a general report of the Secretary is reprinted the following:

General Report.

During the period covered by this report ten bulletins were sent out, as well as a number of circular letters.

These bulletins and letters covered a wide range of subjects.

Bulletin No. 37 directed attention to a new income tax ruling dealing with the valuation of inventories, as well as notice of the discontinuance of food licenses under the Food Administration, and also gave a review of general business conditions as reported by the Federal Reserve Board. With this bulletin was also enclosed copy of the constitution and by-laws revised to October 14, 1920.

Bulletin No. 38 referred to our Uniform Cost Accounting System, again urging upon members the desirability of adopting the system.

Bulletin No. 39 referred to the application of the American Railway Express Co. for change in estimated weight on Ice Cream shipments, calling special attention to the denial of the request of the carriers for an advance on returned empties; is also made mention of the rescinding of the double tagging rule.

Bulletin No. 40 referred to the new income tax regulations covering the proper classification of traveling expenses, the tax on dues to commercial organizations, and the filing of income tax returns. It also called attention to the fact that binders for bulletins could be secured through the Secretary's office, and gave further information in regard to double tagging.

Bulletin No. 41 referred to some Treasury decisions, setting forth the proper method of valuing inventories under the revenue law.

Bulletin No. 42 referred to the work of the Committee Research Laboratory, quoting a communication from Chairman A. B. Gardiner of that Committee asking members to present their views and suggestions with regard to the Laboratory. National Dairy Council leaflets were also sent with this bulletin, and mention was made of the new membership certificates issued by the Association.

Bulletin No. 43 dealt with the work of the War Finance Corporation in granting loans to finance the export of condensed milk and other milk products; it also gave information as to the Federal Reserve Board's review of business conditions.

Bulletin No. 44 referred to developments in the express classification matter, to Department of Agriculture publication, and to reprint from the Journal of Dairy Science, this reprint being copy of an address delivered by Dr. O. E. Williams of the Dairy Division, U. S. Department of Agriculture, entitled "Proportioning the Ingredients for Ice Cream and other frozen Products (the Balance Method)."

Bulletin No. 45 made further reference to the attitude of the National Association regarding the use of foreign fats as substitutes for milk fats in Ice Cream, asking that members report any instances of this nature coming to their notice.

Bulletin No. 46 referred to new income tax rulings on depreciation and refund of taxes erroneously collected, also setting forth the activities of the Association's Committee on Tax Revision. With this bulletin was also enclosed a copy of membership list revised to April 1, 1921.

The Secretary's office also addressed the franked envelopes for Dr. O. E. Williams of the Department of Agriculture, in order that he might send to our members copies of the Department's publication entitled "Sandy Crystals in Ice Cream; Their Separation and Identification."

These various bulletins prompted a large number of inquires for additional information on many of the subjects referred to. The volume of correspondence has increased tremendously during the past year and has covered a great variety of matter. The increased correspondence, however, is particularly gratifying, indicat-

ATLANTIC
—*the super-clarified*
GELATINE

FOR more than two years we have been constantly at work in our laboratories striving to develop a process which would mean greater purity, greater clarity, for Atlantic Gelatine. And now our months of ceaseless efforts and experiments have resulted in a super-clarified gelatine so pure—so clear—that you will admit these features the moment you see Atlantic in solution.

Atlantic Fears No Pure-Food Legislation

But super-clarity, even with our special process, would have been impossible were it not for the fact that the raw materials used in Atlantic are finer than those used in the making of most gelatine. That is why Atlantic Gelatine passes the pure-food requirements of any state in the Union —even Pennsylvania and North Dakota.

Not only is the superior quality of this super-clarified gelatine to your advantage, but likewise is there a greater economy in the use of Atlantic. Grade for grade, it costs less than others and does more.

Make Us Prove Its Merits

Send for a barrel of Atlantic Gelatine today. Use five, ten, or even fifteen pounds. If, after a fair test, you decide that Atlantic isn't your gelatine, send back the unused portion and we will pay freight both ways.

That's how sure we feel when we make the statement that Atlantic—the super-clarified gelatine — is a better gelatine and will save you money.

ing, as it does, that fact that the members were appreciative of the service the Secretary's office was endeavoring to render.

A review of the correspondence in our files indicate that between twelve and fifteen thousand letters were written during the past year, this being in addition to circular letters, requests for payment of dues, etc., etc. Many of the communications received from members referred to matters that necessitated a great deal of detail work in obtaining the desired information.

A persistent campaign for increased membership was kept up during the year, as a result of which ninety-six new active members have been obtained.

* * *

President Martin read his address as follows:

Our Association has reached its majority with the calling of this convention—this being the twenty-first gathering we have had of this kind.

While our years, therefore, have long since entitled us to put aside our toddling clothes, we are nevertheless, in the sense of our achievements, still in our infancy.

The last five years have marked our greatest progress, development and usefulness. The immediate future, I believe, will bring vastly greater possibilities to our industry than is indicated for any other industry with which I am familiar.

But, while we have much to hope for, we must not overlook the fact that too many of us are inclined to use rule of thumb methods. We sometimes seem to find it difficult to grasp new ideas and enter upon new undertakings with the vision and confidence that spells success.

For example, I might be accused of being a visionary if I were to express the belief that Ice Cream will some day in the not far future be produced much more efficiently than by the present freezer method; and that this new method will, among other advantages, give us a far better control of overruns. But I don't hesitate to predict that just such improvements in our methods of manufacture are coming much sooner than most of us realize.

And what is more, I am confident that even as great as the volume of our business has become, we have done little more than scratch the field of our possibilities. Better selling methods, better advertising and a sounder and more thorough analysis of our markets and of the measures of desirability of our products will, I believe, bring us far greater returns than we have ever before thought possible.

While other industries are still staggering and stumbling through their adjustment period—blinded by the light of the new order of things into which time has brought them—our business is "up and doing," and is little the worse for the experience common to all business activities during the past few years.

But let us not deceive ourselves. Most of this happy situation has not been due so much to any particular foresight on our part as to the fact that making a perishable article as we do, the manufacture of which does not require or permit of our carrying very large stocks of raw materials, we have not been caught with stocks which have fallen in value since our purchase. The importance and advantage of quick and frequent turnovers is especially demonstrated in our business.

Another blessing that we are enjoying is the comparative freedom from wage scale readjustments. The chances are that this factor will give us very little concern. Wages, as I see it, will never be brought down to pre-war conditions. And I much prefer not to see such decrease, as well paid employees—which as a rule means better satisfied and more efficient employees—are an absolute essential to our continued development.

A work to which, I believe, we can profitably turn our best attention is to do everything in our power to free ourselves from the burden of excessive and exorbitant express rates that nearly all of us are compelled to pay.

In this connection, I would recommend to my successor that our Secretary be instructed and authorized to make an immediate survey among our members and ascertain facts and figures as to the losses they have sustained in their shipping business.

Upon the compiling of this report I would suggest that instead of being presented to the Interstate Commerce Commission that the matter be taken up directly with the Express Company by a strong committee from our Association. I believe that we can hope for prompt and fair adjustment if the facts are presented in this way. Express officials are human. They are alive to the fact that if they would preserve and increase the business they do with us, they must make it possible for us to deal with them advantageously.

This friendly feeling on the part of the Express Company was, indeed, well demonstrated in the Glacifer Case, in which an examiner of the Interstate Commerce Commission rendered its report favoring the Glacifer Company, and requiring the Express Company to advance our rates an additional 40%.

In this connection, I wish to call your attention to the value of your Association in such matters as this Glacifer Case. Had it not been for our strong organi-

NATIONAL DAIRY EXPOSITION

A TRIP to this inspiring Exposition will give you both profit and pleasure. PROFIT — in learning the new factory methods — in seeing the latest dairy machinery — in getting fresh ideas and the national viewpoint. PLEASURE — in taking a week from business and meeting the leaders of your industry.

Conventions and meetings will afford you a chance to meet leading milk dealers, creamerymen and experts in all dairy lines and to learn their ideas and methods.

The exhibit of prize-winning butter and cheese will be well worth your careful inspection. The Dairy Division of the U. S. Department of Agriculture will have a new exhibit of great interest and value.

The machinery exhibit will be larger than ever before, with all the improvements and latest appliances for better factory equipment.

Every department will be full of practical information for you in your business.

It's YOUR Exposition —Why Not Use It?

National Dairy Exposition

St. Paul—October 7 to 14—Minneapolis

zation, this additional burden would have been imposed on us.

The credit for handling this case is due Mr. E. B. Lewis of New York, who went to Washington in person and arranged with Davies & Jones, Attorneys, to file our protest. As a result of this protest, the Commission overruled the report of the Examiner and gave a ruling in our favor.

This concrete case should prove to every member that his Association is a real insurance agency for the protection of his business. None of you would so neglect your business as to discontinue your fire liability or other insurance. Would it not be just as foolish to deny one's self the kind of business insurance afforded by our Association?

This brings to my mind the increased importance of our Secretary's duties, which has been brought about by the decided growth of our Association, and which growth, I predict, has only started. We must be prepared to be more aggressive in securing additional membership and in rendering more and better service to our members. Our affairs should be conducted along rigid business lines, but just as elastic and capable of expansion as in any other well organized business. For such additional service from our Secretary's office, we must expect to pay a salary in keeping with his duties and efforts.

The reports of our Secretary and Treasurer, reviewing the year's work, are pleasing, indeed, to the officers. The increased membership and the financial condition of our Association should be especially pleasing to our members. I want to emphasize the absolute necessity of our continuing our efforts to secure new members. Our continued growth means increased strength and the benefits that accrue from membership in the Association will be infinitely greater. I consider that every member owes it to his Association to interest himself to the extent of securing at least one new member this coming year. Our members and associate members, it must be admitted, have little credit due them for any such activities during the past year.

Those whose names appear on the honor roll for securing new members are as follows:

C. A. Odom, credited with having secured two new members.

W. W. Campbell, credited with having securing one new member.

Your Secretary, credited with having secured eight new members.

The balance of our new members were secured through the Secretary's office.

To these must be added the eleven new members secured by your President.

I feel that in this, as well as in other ways, we should take a greater interest in our Association. It was no task for your President to secure these new members; in fact, he found it a pleasure to secure the few that he did.

Our total membership, both active and associate, September 10th, was 704. Let us resolve to set our goal this coming year at 1000 members enrolled and in good standing for our 1922 Convention. This should be easily accomplished with at least 2000 prospects to work on.

I am sure it will be of interest to our members to know that we have lost but four members the past year due to the increase made in our Annual dues .

I am deeply indebted to the officers and members for the support that I have received from them, and we

are all indebted to the Chairman and members of Committees for their efforts and labors in our interest.

Your President made a trip to California at the invitation of the California Ice Cream Manufacturers' Association to assist them, in so far as he could, in the weight law before their Legislature in Sacramento. Officials of the California Association should be given due recognition for the elaborate preparatory work that was in a measure responsible for the law not being placed on the Statute books of their State. Had this law been enacted, it might have reflected against our industry in many other states.

This is just another illustration of what the Association can do for our industry, and proves the old saying that "Trouble brings men together."

Let me here bring to your attention a matter that may further affect our industry. We must fight any attempt on the part of our members or any Ice Cream Manufacturers to use in any way substitute fats in Ice Cream. It came to my attention the early part of the year that an attempt had been made on the part of some manufacturers to use substitute fats and I feel that our Association should fight this to the bitter end.

We should use every effort along sanitary lines. "Sanitation" should be our watchword. Guard against contamination. Every Ice Cream manufacturer should surround his product with every possible safeguard, because Ice Cream is the favorite food of children and we cannot be too particular about making it safe as well as "good."

You will notice by your program that the subjects listed do not call for discussion, but I desire to impress upon you that great good is derived from full discussions; and to further impress upon you that this meeting is held for your pleasure, good and enlightenment. If good is not derived by you, I will say it is your misfortune. I earnestly hope that all subjects on our program will be fully discussed and the good in them brought out.

* * *

Address of Welcome by Mr. Holmers, Assistant State Dairy and Food Commissioner of the State of Minnesota.

I wish to extend to you all on behalf of Mr. Heen a most hearty welcome, and we sincerely hope that your stay here will be a pleasant and profitable one.

As Inspector it has been my duty to see that sanitary conditions are observed in all places where food is manufactured or offered for sale, and that all the requirements of the law are complied with, but it has also been the policy and aim of the Department to give help and assistance to all who may need such aid, as far as we can.

It is necessary in the production of a finished product of high quality that the utmost care as to cleanliness and sanitary conditions be observed at all times. The plant should be kept scrupulously clean and no waste matter should be allowed to accumulate. A good cement floor with proper drainage is necessary and should be well cleaned every day. A clean, well-kept factory will go a long way toward favorably impressing a prospective customer visting the plant.

As soon as returned ice cream cans should be washed thoroughly and well steamed and allowed to dry; cans that are badly rusted should not be used until retinned.

It is a regretable fact that so many cans are returned in an unclean condition, and we are doing all we can to remedy this situation. I would suggest that every ice cream manufacturer send out printed pamphlets quoting the law with respect to the cleaning and prompt return of the cans. I believe the co-operation of all the ice cream manufactuerers on this point will go far toward remedying this condition.

In order to produce ice cream of a high quality the ice cream maker must have good raw material. It is necessary to have the proper equipment and clean sanitary conditions, but if the raw material is poor or of an inferior quality, the finished ice cream must also be of an inferior quality. Cream that has developed an acidity noticeable to the taste should not be used for ice cream; cream that is off flavor will impart to the finished ice cream the same flavor, and it is useless to try to cover it up with vanilla or other flavors.

Many of our ice cream factories are using sweet butter at times when it is difficult to secure enough sweet cream to fill their orders, converting the butter into cream through an emulsifier. In converting butter into cream for ice cream care should be taken that only good butter be used as any off flavors that butter may contain will be noticeable more or less in the ice cream. I believe that sweet cream, properly pasteurized, will always make the best ice cream.

It is not my intention to go into the details of ice cream making as you will no doubt have these questions discussed by other speakers at this convention, but I would like to state that it should be the aim of every ice cream manufacturer to make a product with as low bacteria content as possible. This is accomplished only by the proper pasteurization of the cream or the mix before freezing.

The Iowa State College, Ames, Iowa, in their bulletin No. 186, "Bacteriological Study of the Method of

ICE Cream advertising is put across most effectively to the largest number of people by the dominant outdoor medium — colorful 24-sheet Posters.

Leading ice cream manufacturers advertise by Nordhem Posters because the reputation of "ice cream advertising de luxe," which Nordhem Posters bear, is founded upon definite selling achievements.

Pasteurizing and Homogenizing the Mix," gives some very interesting facts in regard to controlling the bacterial count of ice cream. The experiments show that the mix can be successfully pasteurized, homogenized or viscolized with very low bacterial content as the result.

We have some manufacturers in this state who are preparing an ice cream mix for shipment, with all the ingredients standardized, with the exception of the vanilla flavor, and ready to freeze. This no doubt will be an aid to the small manufacturer who may be lacking in the proper equipment for preparing the mix, especially in regard to homogenizing or viscolizing; many small manufacturers feel that their business will not warrant the installation of much expensive equipment. There may be many manufacturers located in territory where it is difficult to get a large enough supply of sweet cream to fill their ice cream orders. In such cases it would probably be to their advantage to have the mix shipped to them, ready to freeze. We also hear a good deal about the ice cream mix being dried into a powder, ready for shipment to the ice cream factory, where, with the proper addition of water to dissolve the powder, it is ready to freeze into ice cream. We are surely living in an age of progress and invention. In the last few years greater importance has been laid on the total solids content of ice cream. I know some manufacturers who are preparing their mix with a total solids content of 37 to 38% and are making a very fine and smooth ice cream.

All ice cream sold in this state must have 12% of fat, except fruit and nut ice cream, which may contain 10% of fat. The Minnesota law defines ice cream as follows: Ice cream is a frozen product made from cream and sugar with or without a natural flavoring and containing not less than 12% by weight of butterfat. Fruit ice cream is defined as a frozen product made from cream, sugar and sound, clean, mature fruits and containing not less that 10% by weight of butterfat; and nut ice cream is a frozen product made from cream, sugar and non-rancid nuts and containing not less than 10% by weight of butterfat.

While the state law regulates the minimum fat content in ice cream, the amount or per cent of the balance of the total solids content is optional with the ice cream manufacturer. During the time when sugar was scarce, substitutes were used, but at the present time, when sugar is plenty, there is no need for substitutes, and as sugar is a valuable solid in ice cream, there should be no cutting down on the sugar content. The formulae of many ice cream makers call for 14% of sugar, and the skim solids in many formulae are 10 to 11%, with .5% for gelatine solids.

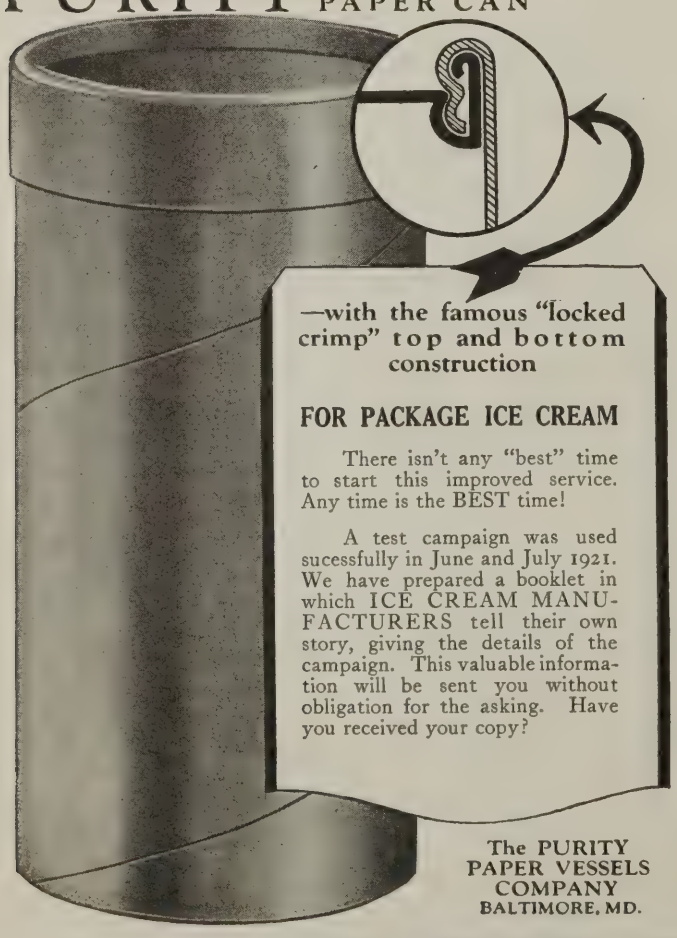
I want to thank you all for your kind attention, and we wish you a hearty welcome to our state and our city —the Twin Cities. We hope that you will enjoy your visit and we shall be glad to have your National Convention meet here again.

President Martin: We are indeed thankful to Mr. Holmers for the message he has brought us; it is very pleasing to know that the state of Minnesota, through its Food Department, is giving so much support to the ice cream manufacturers. That is the kind of co-operation we should have from all our state departments.

The meeting adjourned at twelve o'clock.

Afternoon Session.

President Martin: As you know, we made a rearrangement of our program to have the meeting this afternoon and one of the numbers is that of "Increasing Ice Cream Sales in Winter," by W. M. B. Sine, of Clarksburg, West Virginia, President, West Virginia Association of Ice Cream Manufacturers. Mr. Sine is not present and much to my surprise your Secretary here arranged with my daughter, Miss Jacquelin Martin, to read this paper for Mr. Sine. Miss Jacquelin, will you come forward?



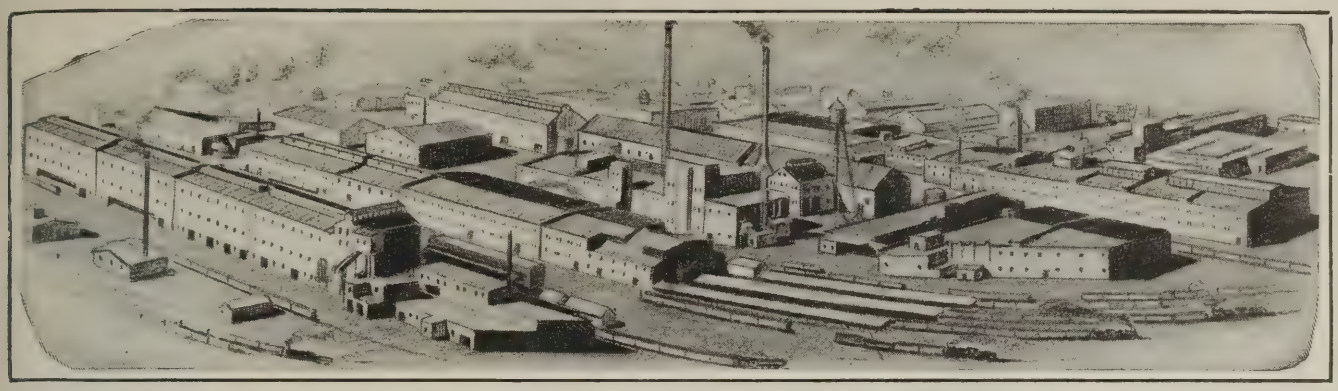
Miss Martin read Mr. Sine's paper as follows:

Increasing Ice Cream Sales in Winter is the biggest problem in the ice cream business today. This subject, I think, is on the program with the idea of starting an argument, for just like all the rest of you, I "see red" during the winter months, but in my opinion, winter sales can be increased. The trouble is we think we are licked before we start. We think it can't be done and, consequently, it is not. The whole trouble is that we have been in the habit of pinching down on the service and getting grouchy when frost came, really selling ice cream in the winter time under protest. In other words, we were bears instead of bulls and trying to sell our ice cream short. The candy man doesn't let down when warm weather comes. He works harder. So does everybody else engaged in alleged seasonable business.

Now, from what I can observe there is no reluctance on the part of the public to eat ice cream every day in the year if it is offered to them. Every formal dinner, even if served on the coldest winter night, includes ice cream, every hotel continually includes it in its menu and when your wife or my wife plans a dinner party the weather has nothing at all to do with what she serves for dessert.

Just sitting back and saying "it can't be done," doesn't seem just right and so with the idea of trying

PURITY THE ORIGINAL PAPER CAN



—with the famous "locked crimp" top and bottom construction

FOR PACKAGE ICE CREAM

There isn't any "best" time to start this improved service. Any time is the BEST time!

A test campaign was used sucessfully in June and July 1921. We have prepared a booklet in which ICE CREAM MANUFACTURERS tell their own story, giving the details of the campaign. This valuable information will be sent you without obligation for the asking. Have you received your copy?

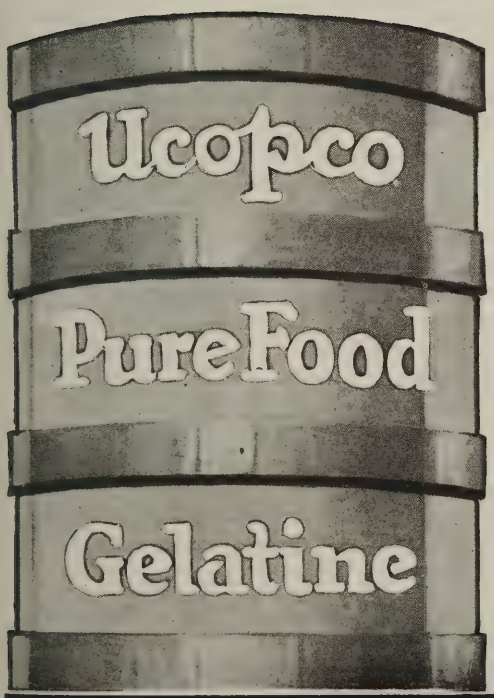
Where "UCOPCO" is made

There Are Reasons Why This Plant Has Been Operating to Capacity for the Past *Five* Months



WHEN any plant finds it necessary to run to utmost capacity during a period of depression, it proves conclusively that its product must rank far above the average.

During the past ***five*** months our mammoth plant has been running night and day and immediately shipping its entire production.

Salesmanship must be given credit for its part in creating this unusual success. But salesmanship alone could not produce this phenomenal condition.

The product must be right.

Let us show you why UCOPCO Gelatine is so tremendously popular.

The United Chemical & Organic Products Co.

4200 S. Marshfield Ave. Chicago, Ill. — New Orleans — 401 E. 45th Street New York, N. Y.

"UCOPCO Comes Sealed in Red Drums"

PROSPERITY FOLLOWS THE DAIRY COW. Be sure you attend the National Dairy Exposition—St. Paul-Minneapolis, Oct. 7-14.

an experiment at one of our branches three years ago, we decided to distribute some of the advertising appropriation for that particular plant over the lean months, as we found the hot weather gave enough momentum in the summer to carry sales along without the additional acceleration that advertising furnished. We started that advertising with the waning of the season and kept increasing gradually until spring business started, when we let down. We made our product just a little richer, gave just a little bit better service, saw to it that the stock in dealers' hands did not get old, coarse and grainy or flavorless, as ice cream will get when kept too long. We also make special flavors to add variety and tempt the jaded appetite. We asked dealers to suggest flavors for the week; showed them that we were interested in them.

To call attention to these specials, we used window streamers and window displays, even in the coldest weather of the year at the expense of being considered weak-minded. We also had a series of direct-to-the-consumer advertising in the form of announcements, in which was suggested new flavors and novelties in which ice cream could be served in the home, hot sauces, recipes, etc. Our order clerks scoured the papers for notices of lodge, church, and other affairs.

When we took stock at the beginning of the summer season, we found that we had kept more of our organization together than in the previous years; the milk producers were in a sweeter frame of mind, and, best of all, dealers were in line and more enthusiastic.

The following year we tried it out on a second plant, let up on advertising a little at the first plant, but not on the service, and we carried two of our plants through without red figures. Last year, with the help of the weather man, five of our plants increased their sales sufficiently to overcome the usual red figures.

This fall we have started the campaign on a more elaborate scale.

Per cent average for the winter months before and since going after winter sales were as follows:

	1917-18	1918-19	1919-20	1920-21
October	.04	.04	.08	.09
November	.02	.02	.05	.06
December	.02	.02	.03	.05
January	.01	.02	.03	.05
February	.02	.02	.03	.05
March	.04	.04	.05	.07

I want to stress a little bit the effect of winter advertising on our dealers. They quickly realized that we were out to do something and after awhile they took hold, too, and did their part. Instead of getting listless and indifferent in their service, the winter months found many of them on their toes and when spring came we had team work and accelerated our summer business.

And another by-product of our advertising which we had not foreseen has been the effect on our own employees. The growing business keyed them up, too. They had to live up to the advertising and instead of the rather perfunctory service which they had heretofore given during winter months, we obtained very enthusiastic work and thereby we kept our organization together through what we commonly called the dull season.

We haven't been niggardly about spending money, but we haven't been wasteful. Big newspaper advertisements cost money but big advertisements have the habit of starting people to think and what we wanted was to get them to think about our ice cream. We also made every possile effort to have these advertisements kick out of the page. Outside of the big city dailies the general run of advertising is often pretty plain stuff and we figured that clean type, good pictures and a general air of smartness was worth all it cost.

We are very well satisfied with the results, and hereafter I believe we shall stop bothering about the weather man and go about our business of thinking up ways to make the consumer hungry for ice cream. At the same time we shan't overlook the very important think of making it possible for him to get it when he has the notion. Thereby we shall help along the general cause of increased business in winter months as well as help ourselves and so far as I have observed this is what we are in business to do.

I haven't preached a doctrine I don't follow. I haven't preached at all in fact—and this talk is in no sense the imparting of any secret of success—I've tried to tell, in my own way, that ice cream sales can be increased in winter and the proof is the fact that we've done it and expect to keep on doing it.

* * *

President Martin: We are certainly thankful to Mr. Sine for his interesting paper and also to Miss Martin for reading it.

The next on the program is "A New Era in the Packing of Brick Ice Cream," by Mr. Timothy Mojonnier, of Chicago.

Mr. Mojonnier's paper was published in the October issue of The Ice Cream Review.

Mr. C. E. Rogers, Detroit, Mich., followed with an address on the subject, "Packaged Ice Cream," which was also published in the October issue.

(Concluded on page 94)

2,048,000 Dishes of Mapleine Ice Cream

Produced by One Plant in 1921

51,200 gallons of Mapleine Ice Cream were sold by a Pennsylvania plant last season—2,048,000 dishes. And according to their Superintendent Mapleine Ice Cream sales exceeded the combined sale of strawberry, chocolate and cherry.

Mapleine

Introduce Mapleine Ice Cream to your trade and it will become one of your best selling flavors because the consuming public knows Mapleine and likes it.

Mapleine is one of the most profitable flavors, too, for 16c to 20c flavors 10 gallons Mapleine Ice Cream.

Order Mapleine of your supply man or send us $3.00 for a quart trial bottle.

Imperial
ICE CREAM

TWELVE years ago, when advertising relations with Barker, Duff and Morris were begun. *Imperial Ice Cream* was known in a single town—Parkersburg, W. Va. Today, seventeen thriving plants, located in six States serve thousands of people to whom "Imperial" is a household word. The advertising connection, begun twelve years ago, has never been interrupted even for a single day. Last month, following the successful opening of a new plant, the President wrote, "I want to take this occasion to compliment you on the thorough manner in which you put it over. I say 'you' because I give your organization credit with the planning, scheming and pep that was needed to bring our loyal and enthusiastic bunch into form."

We create a new campaign each year and every day we gain a little broader knowledge of the business of advertising Ice Cream. If you desire specialized, experienced service which will cover every feature of tried forms of advertising write today and let us give you fuller details or have one of our representatives come to see you.

A Study of Enzymes and Albumin in Milk Pasteurized in Steam Jacketed Enameled Vats

By MAX DONAUER, Chemical Engineer, Research Laboratories, Elyria Enameled Products Co., Elyria, Ohio.

Tinned copper has been in general use as a partition or heating wall in building milk equipment for a long time. It is generally understood by milk plant operators that hot water is the proper heating medium to use. Experience has taught that steam will scorch milk and cause the solids to burn to the metal. This is true because heat passes rapidly through copper.

MAX DONAUER.

Enameled steel is a more recent development in material for building milk equipment. It is not generally understood that, when used as a heating medium in connection with enameled steel, steam does not harm milk. This is true because heat passes slowly through steel and because the enameled surface acts as a further heat restraining medium.

The rate of heat transmission through enameled steel is about three times slower than through tinned copper. Therefore, it is necessary to maintain a higher temperature in the heating jacket in order to obtain the same results. For example, the heating surface in a tinned copper coil vat is nearly the same as that of the enameled pasteurizer. They heat in about the same time although the temperature in the jacket of the enameled vat is much higher.

It is a very simple matter to determine whether or not milk is injured by pasteurizing with steam in an enameled vat. The experiments described below may be repeated in any milk plant laboratory, as they are standard recognized methods of determining the point in question and hinge entirely on the presence or absence of enzymes and the amount of albumin determined analytically.

Enzymes are widely distributed in products of both plant and animal life. They possess the property of converting foods into simpler soluble substances which can be assimilated by the stomach and in this way play an important part in the maintenance of animal life. Saliva contains an enzyme which will dissolve starches, while pepsin contains products which break up albuminous material. Milk contains several types of enzymes, the more important being (1) galactase, (2) lipase, (3) catalase, (4) oxidase, (5) peroxidase. Because of the part they play in digestion it is very essential they should not be destroyed.

Milk enzymes are destroyed when exposed to high temperature even for short periods of time. Catalase and lipase are destroyed at 158 degrees F., peroxidase at 170 degrees F. Galatase is weakened between 160 degrees F. and 170 degrees F. but is not entirely destroyed at 200 degrees F. Heating milk to temperatures higher than 160 degrees F. also coagulates the soluble albumin. These facts have brought up the question whether pasteurizing milk in an enameled pasteurizer using a steam jacket might effect the constituents in any way (even though the usual conditions of heating to 145 degrees F. and holding were maintained) owing to the high temperature of the steam used as the heating medium.

In order to investigate this problem a series of tests were made comparing:

1. Fresh milk as received from the farm.

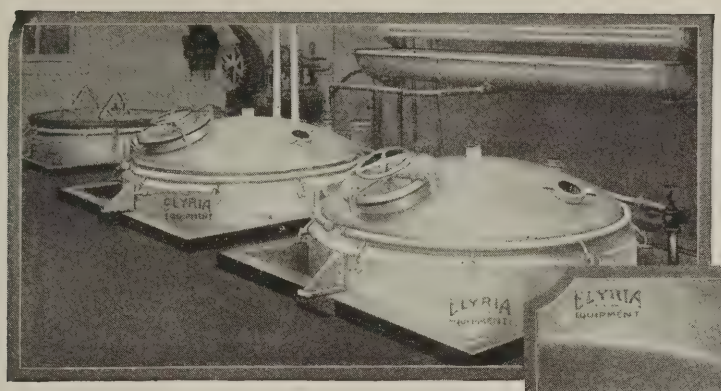
2. The same milk pasteurized in the regular way in a steam jacketed enameled pasteurizer. The milk was heated to 145 degrees F. and held 30 minutes, then run over an open cooler and bottled. Steam at 5 pounds pressure was used.

3. Milk heated in the laboratory to 200 degrees F. and held 30 minutes. The milk used in one series of tests had an acidity of 0.126 per cent and in another series 0.134 per cent.

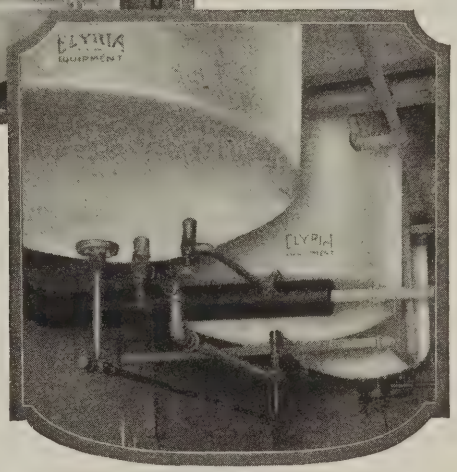
Several of the standard methods of testing for enzymes were used.

1. **Guiac test.** Milk treated with guiac tincture and a drop of hydrogen peroxide gives a blue color or a blue ring if enzymes are present.

2. **Guiacol test.** Milk treated with a solution of guicol and a drop of hydrogen peroxide will turn distinctly orange. In the absence of enzymes no color change takes place.



3. **Paraphenylene Diamine test.** Milk treated with dilute hydrogen peroxide and a fresh solution of paraphenylene diamine turns deep blue in the presence of enzymes but remains perfectly white if they have been destroyed



The guiac and guiacol tests are especially sensitive towards the oxydases while the paraphenylene test is more indicative of catalase and galactase.

All three of these tests when applied to the milk gave positive indications for both the raw milk and the milk pasteurized with steam in the enameled pasteurizer, while in the case of the milk heated to 200 degrees F. the tests were entirely ngative. Thes results indicate that enzymes present in raw milk are not affected by pasteurization in enameled pasteurizers. Raw milk, which responds to the above tests for enzymes, will respond to the same tests after being pasteurized in enameled vats.

A study was also made of the albumin in the various samples indicated above. The casein in (1) the raw milk, (2) the milk pasteurized in an enameled pasteurizer, (3) the milk heated to 200 degrees F. and held 30 minutes was coagulated with magnesium sulphate and filtered off. The amount of soluble albumin in the clear solutions remaining was determined by separating out the albumin with tannin, filtering off and determining the albumin content.

The raw milk had a soluble albumin content of 0.58 per cent; the milk pasteurized in the enameled pasteurizer contained 0.56 per cent; and the milk heated to 200 degrees F. for 30 minutes contained 0.18 per cent, showing that albumin is largely coagulated if temperatures as high as 200 degrees F. are reached. These results indicate that pasteurizing milk in an enameled pasteurizer does not alter the content of soluble albumin or interfere with the enzymes, but leaves them as they are found in raw milk.

This photograph shows the 500-gallon Elyria Glass Enameled Steel Pasteurizer and the two 1000-gallon Aging Tanks used by the Fort Smith Ice Cream Company of Fort Smith, Arkansas. Notice the arrangement to save floor space and head room.

Here's the Proof!

Elyria Enameled Products Co.,
Elyria, Ohio

Dear Sirs:

"A four year trial of one 500 gallon Ice Cream Pasteurizer and two 1000 gallon aging tanks has proven to us the advantage of using Elyria Equipment in the manufacture of our cream. We find that these tanks are in as good condition today as when installed. They are easily cleaned and tend to improve the sanitation of the product.

"In conclusion we wish to say that we are more than satisfied with the results obtained and feel that they are directly responsible for materially reducing our overhead expense and giving us a more uniform and better flavored cream."

Forth Smith Ice Cream Company

"They are directly responsible for materially reducing overhead expense"

—FORT SMITH ICE CREAM COMPANY

SOME equipment cuts production costs; some raises quality of product—Elyria Tanks do both! While all Glass Enameled Steel Equipment has some common characteristics, Elyria has pioneered in developing *original* qualities in design and construction which save time, labor and space; increase production, maintain sanitation and improve flavor of product.

Free Booklet tells the Story

This interesting booklet contains pictures of Elyria Storage and Aging Tanks, Mixers and Pasteurizers in use; tells about Elyria enamel — the highest grade in the world; explains Elyria developments of design and construction—built-in quality—not laid on. It helps show what "Processes, not just Equipment" means.

In your own plant, an Elyria engineer can demonstrate Elyria Equipment — show how it can be applied to your business with profitable results — prove that Elyria service means something. Use the coupon.

Powers and Privileges of Trade Associations

THE questions arising out of the activities of trade associations are of such complex legal character that it has been deemed wise to publish the whole correspondence between the Department of Commerce and the Department of Justice upon this subject, which is as follows:

DEPARTMENT OF COMMERCE,
Office of the Secretary, Washington.

February 3,1922.

My dear Mr. Attorney General:

The situation regarding the activities of legitimate trade associations is more disturbing now than at any time since we first discussed the matter, and since Mr. Lamb was advised by Colonel Goff and Mr. Fowler that it was your desire that I present an informal, inter-departmental inquiry regarding the present status of the law relating to legitimate trade associations and the extent that they may engage in legitimate co-operative activities, I have made a further survey of the matter, and the questions hereinafter presented seem to me to be vital to trade associations based on present information secured through recent investigation.

It may not be out of place to call your attention to the organic act which created the Department of Commerce, which imposed upon the Department the duty "to foster, promote, and develop the foreign and domestic commerce, the mining, manufacturing, shipping, and fishery industries, and the transportation facilities of the United States." In obeying the commands of the statute, it seemed to me that the Department should employ all available legal means to get into the closest possible touch with industry in all its forms and secure the best information possible regarding the needs and necessities of trade and commerce. If the Department has to help, aid, and assist industry, it must, of course, be conversant with the facts and conditions influencing the carrying on of trade. The existence of a large number of trade associations being well known prompted me to make inquiry regarding their forms of organization and the functions they were performing to ascertain whether or not they could be utilized as a means for securing trade information that would properly aid the Department in performing its duties. My inquiry into the affairs of trade associations was not with the idea of creating a new scheme for carrying on business, but solely for the purpose of ascertaining whether or not they could properly be utilized in furnishing information that would not only be helpful to the Department and to the commercial world but to the public generally, always keeping in mind that whatever activities were carried on by such associations, they should of necessity be within the terms of existing law. In the course of my inquiry, I discovered that certain trade associations were involved in litigation which questioned the legality of their performances, and, by reason of the litigation, there was much doubt and confusion regarding the legal limits within which trade associations could properly operate. This situation seemed to call for conferences with your Department, which you have graciously afforded, and although no definite determination has heretofore been reached regarding the policy to be pursued, I realize the difficulties that confront you in attempting to reach realize the difficulties that confront you inattempting to reach a proper conclusion, and while a public announcement from you would have been most helpful to all, I most heartily acquiesce in your suggestion that the matter be presented as an informal, interdepartmental inquiry for my guidance in performing the duties imposed upon me by the organic act creating this Department.

So much has been said in the various conferences, coupled with lapse of time, in order to obviate excusable failures in memory as to the matters that have heretofore been discussed and to make clear the position and views of this Department, I desire to offer some preliminary observations regarding trade associations before asking the specific questions heretofore set forth in various informal memoranda and upon which I desire the informal expression of your views.

Commercial progress in industry has always been measured by the advance in knowledge of those engaged in industry. It is impossible for men to acquire or secure all possible knowledge at one time. Its acquisition is a growth resulting from continuous, intelligent inquiry. The knowledge of an industry that is necessary and essential to its success must embrace all facts and circumstances that will in any way influence that industry. These facts and circumstances must include economic conditions as well as scientific facts to the extent that science is called into play in its operation and all commercial conditions that make for efficient production, merchandising, and distribution. No one will dispute the foregoing statements; they are fundamental and necessary to the life of trade and commerce.

The difficulty seems to lie in the determination of the means and methods that may be adopted to secure this necessary information. Little, if any, trouble is experienced in securing the admission that an individual may secure knowledge of these facts by any means that would not constitute an individual crime, and that he may use the information in such manner as his best judgment may tell him will bring him the greatest benefit.

But when two individuals engaged in the same line of industry undertake to provide a means for securing facts necessary and essential to the economic and efficient conduct of their respective organizations, this form of endeavor seems to at once assume an aspect of difficulty, that, in my judgment, is in no way justified by a proper consideration of the underlying necessitities therefore.

The individual sets up some form of instrumentality to secure the information without which, in the management of his business, he would be groping in the dark. His competitor across the street does the same thing, and each, securing his information in his own way, uses it as he sees fit, and the action of either one has not offended the majesty of the law. Yet, if the two seek to join the instrumentality each has used for information purposes and the same information is received through one instrumentality and the information given to each and it is used in the same way that it was before, it is suggested that the collective activity in the use of the consolidated instrumentality should not be permitted because of the greater ease and facility thereby afforded for the two individuals to make improper use of the information acquired. In other words, the objection does not go to the instrumentality, but to the abuse of the information that may be secured through the collective means.

The principle is the same whether two or two hundred join together in securing the information.

No form of legislation has ever yet been devised, nor has man, with all of his genius for invention, even been

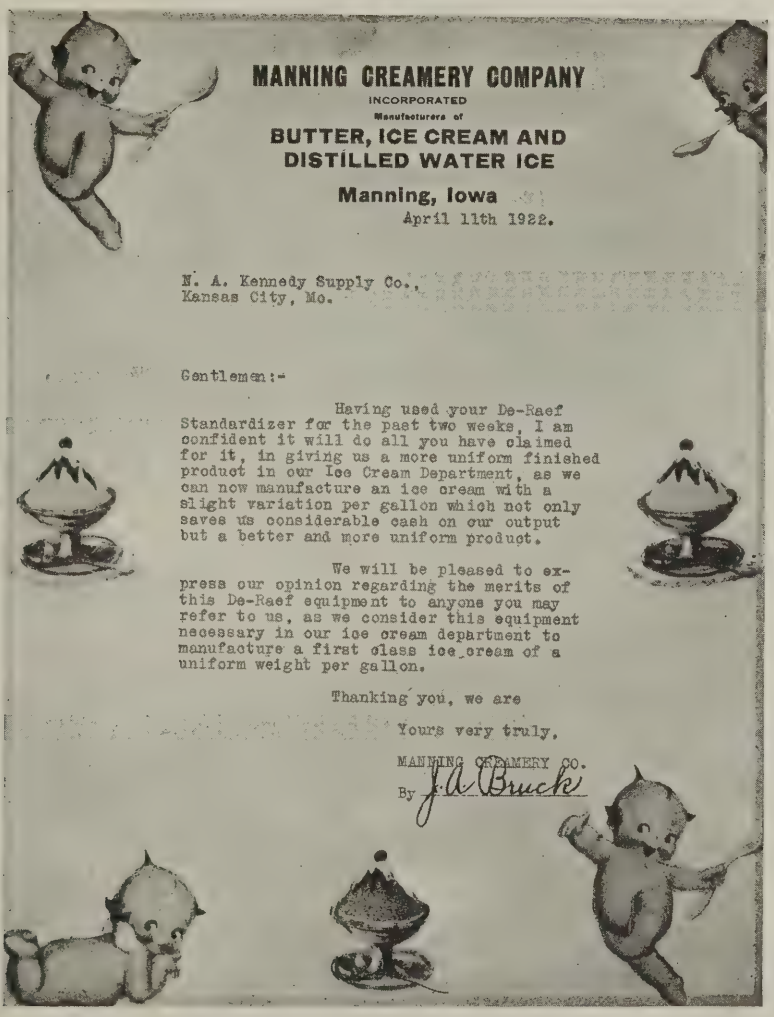
SODA MENUS

Effective Advertising For Ice Cream Manufacturers

OUR menus are popular among ice cream manufacturers who give them to druggists and confectioners with the manufacturer's trade-mark or advertising slogan printed on them. This is a sure and inexpensive means of advertising the ice cream manufacturer as the menus come to the attention of the customers of the retailer.



These menus are **especially** for the Soda Fountain. They are not hotel menus nor restaurant menus, but are printed and embossed in colors on the highest grade of stock and reproduced from original drawings for the use of Soda Fountains exclusively.

Samples Free on Request.

N. A. Kennedy Supply Co.,
Kansas City, Mo.

Gentlemen:-

Having used your De-Raef Standardizer for the past two weeks, I am confident it will do all you have claimed for it, in giving us a more uniform finished product in our Ice Cream Department, as we can now manufacture an ice cream with a slight variation per gallon which not only saves us considerable cash on our output but a better and more uniform product.

We will be pleased to express our opinion regarding the merits of this De-Raef equipment to anyone you may refer to us, as we consider this equipment necessary in our ice cream department to manufacture a first class ice cream of a uniform weight per gallon.

Thanking you, we are

Yours very truly,

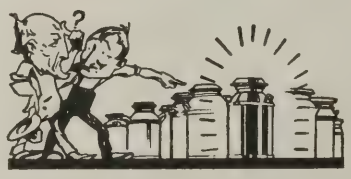
able to devise a rule or regulation that would prevent men from committing crimes if they are so minded. The best that can be done is to forbid the doing of certain acts or to command the doing of others, prescribing proper punishments in the case of the commission on the one hand and the commission on the other; and when legislation takes that form, rules and regulations and administrative constructions which have for their objective the making of the prohibited thing more difficult will always include within their terms the law-abiding citizen as well as the prospective criminal.

We have had criminals since the beginning of time, and human nature can not be changed by legislation. The criminally inclined represent a small minority, and it may be said in a general way that, excepting offenses against persons and property, most of the criminal statutes regulating trade and commerce and forbidding acts that seem against sound public policy have been made necessary for the control of the minority. None of these statutes, however, has undertaken to prevent the doing of a thing that would result in benefit to the public, but the restriction has been against the doing of the thing in an unlawful way. These statutes have not condemned lawful institutions or instrumentalities for the carrying on of commerce merely because someone might possibly abuse their use. The laws have condemned the abuse, and punishments have been prescribed for those who may be found guilty of the abuse. Therefore, the fact that the minority may be known to violate given laws does not establish a principle that the primary means, lawful in itself, which they have adopted for the purpose of performing the unlawful acts, should be entirely abolished and its use forbidden by law-abiding citizens. Each unlawful use of the means is merely an individual case of the violation of a law.

Trade associations have been in existence for many years. The great majority are legitimate, both in form of organization and in activity. The minority, while lawfully organized under articles expressing lawful purposes, may engage in activities that are evidence of purpose contrary to and outside of the declared purposes in the articles of organization.

Again, a trade association may have lawful form of organization and the activities of its officers may be clearly within the purposes declared in the association charter, and yet members of the organization may, by unlawful confederation, use the information lawfully secured for unlawful purposes. It may, therefore, thruthfully be said that the line dividing the good association and the bad, the proper activity from the improper one, and the lawful activities of the officers of an association from the unlawful acts of the membership, can not be determined, in every instance, with singular ease. It is my belief, however, that it is more easy to determine the forms of organizations and activities that are generally recognized as good than to determine in advance those that may be bad, because, in the latter instance, the peculiar facts relating to each association the subject of inquiry may determine whether the organization or its members are operating in violation of law.

It is with much earnestness that I claim there is propriety, generally speaking, in trade associations. Their lawful field of endeavor is large, and their activities work for promotion and advancement of the public welfare and for progressive economic organization. In making this statement, I am not unmindful of the fact that the impression exists with a small minority that individual prohibited acts may be accomplished by organization under the disguise of a trade association. However, to make my position clear regarding the trade associations the existence of which I advocate, I desire to say that I have always taken the view that no body of men could combine in the form of a trade organization and do any act or thing forbidden by law if they were undertaken by them outside of a trade organization. The character of trade organization, the existence of which should be preserved, is one that carries lawful purposes only in its articles of association; its activities must be in harmony with its declared purposes. The articles of association, with their lawful, declared purposes, must not be used as a mask to hide unlawful purposes. In other words, the organization can not be used to conceal or disguise any contract, combination, conspiracy, agreement, or understanding, secret or otherwise, on the part of the officers of the organization or on the part of the membership or any part thereof to engage in activities in restraint of trade or otherwise in violation of the anti-trust laws.



There has been much information collected by legitimate trade associations in which the general public has no interest whatsoever, yet information of this class has always been freely offered to the daily and the trade press, as well as to any governmental agency that might desire the information as a matter of statistical record. On the other hand, certain statistical data are collected by trade organizations that would be of vast value to the public generally if published in practical, available form.

Many of the trade associations securing and disseminating the statistical data mentioned have restricted the same to its membership, while others have undertaken to give the same to the public through the daily and trade press concurrently with its members. The trade associations of the latter class are in the minority.

Information lawfully secured regarding trade and economic conditions made public for the information of everyone can not be harmful. Information secured solely for the benefit of members and of a character that puts the membership, by reason of the information, in a position of advantage as compared with the public without such information can not be sanctioned by sound public policy. The act of securing the information and the use of it by the member of a particular organization may be perfectly lawful in itself, but it is my belief that good morals and a sense of fair dealing require the giving of the information secured in this collective manner to the public generally, to the end that all persons engaged in commercial transactions involving the information in question will be on an even footing.

The activities of trade associations that have received the greatest criticism involve the collection of statistics relating to volume of production, capacity to produce by districts of production, wages, consumption of products in domestic and foreign trade, distribution thereof including volume of distribution by districts, together with figures as to stocks on hand, wholesale and retail, by districts, coupled with information as to price, either in the form of individual reports of each member distributed to every other member or the individual prices reported to the association and by the latter compiled and averaged by districts for certain specified periods.

If information regarding production, capacity, and distribution by districts, with average prices for grades, brands, sizes, styles, or qualities sold in the respective districts for specified periods of time could be given to the public at the same time that such information is available to the members of an association, in my judgment, great public good would result. With this information available, everyone dealing in the products of a given industry, whether buyer or seller would have the same information regarding conditions and in dealing with one another, would have knowledge of the

same facts upon which to form their judgments as to the proper course to pursue.

A majority of the associations collecting data of the nature indicated have distributed same only to members of the association, while others have undertaken to give the information to the public through the daily and trade papers. Publication of the information by these associations in the daily press has not been general, and its availability to the public has been largely through the medium of trade papers, and through the daily press to the extent that the latter may have been utilized. When published through trade papers this information should be released to members only after such publication.

It should be borne in mind that the criticism aimed at this form of activity has not involved the instrumentality for securing it or the subject matter of the information, but has been directed to the use or possible use that might be made of the information and the fact that no means existed for distributing the information to the public at the same time that it was received by the members of the association. These observations likewise apply to the criticisms directed to the furnishing of average price of given commodities according to grade, size, brand, or quality by districts for specified periods of time, based on past and closed transactions.

With these observations, which have been extended at greater length than I intended, I desire the informal expression of your views as to the following activities on the part of trade associations and their members wherein neither the form of the association nor the activity, which appear perfectly fair and lawful on the surface, is used to hide or conceal some contract, combination, conspiracy, agreement, or understanding, secret or otherwise, on the part of the association, the membership, or any part thereof to actually restrain or otherwise violate the Sherman Act:

1. May a trade association provide for its members a standard or uniform system of cost accounting and recommend its use, provided that the costs so arrived at by the uniform method are not furnished by the members to each other or by the members to the association and by the latter to the individual members?

2. May a trade association advocate and provide for uniformity in the use of trade phrases and trade names by its respective members for the purpose of ending confusion in trade expressions and for harmony of construction as to the meaning of trade phrases, names, and terms?

3. May a trade association, in cooperation with its members, advocate and provide for the standardization of quality and grades of product of such members, to the end that the buying public may know what it is to receive when a particular grade or quality is specified; and may such association, after standardizing quality and grade, provide standard form of contract for the purpose of correctly designating the standards of quality and grades of product; and may it standardize technical and scientific terms, its processes in production, and its machinery, and may the association cooperate with its members in determining means for the elimination of wasteful proceses in production and distribution and for the raising of ethical standards in trade for the prevention of dishonest practices?

4. May a trade association collect credit information as to the financial responsibility, business reputation, and standing of those using the products of the industry; and may the association furnish such information to individual member upon request therefor, provided such information is not used by the association or the members for the purpose of unlawfully establishing so-called "blacklists."

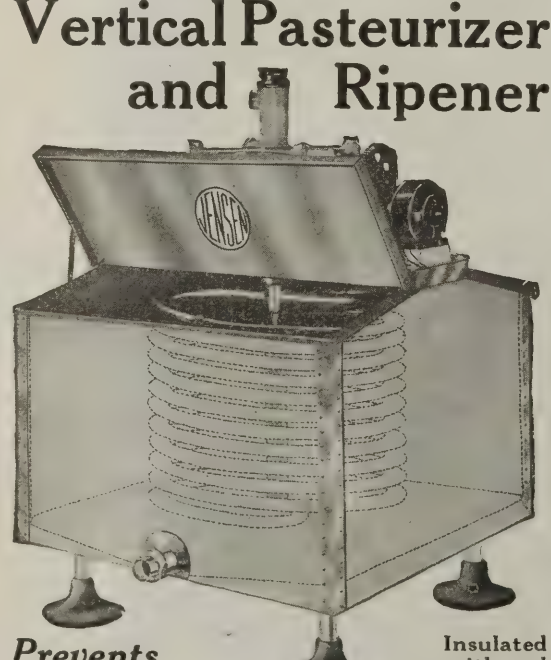
5. May a trade association arrange for the handling of the insurance of its members, including fire, industrial, indemnity, or group insurance. In other words, can the members of an industry, through the agency of a trade association, arrange for or place all of the insurance of the members?

6. May a trade association, in cooperation with its members engage in cooperative advertising for the promotion of trade of the members of that association engaged in the particular industry; and may the association engage in such form of promotion by furnishing trade labels, designs, and trade-marks for the use of its individual members?

7. May a trade association, for and in behalf of its members, engage in the promotion of welfare work in the plants or organizations of its members, which welfare work includes sick benefits and unemployment insurance for employees, uniform arrangements for appreticeship in trade education, the prevention of accident, and the establishment of an employment department or bureau for cooperation with employees?

8. May a trade association, in cooperation with its members and acting for and in behalf of its members, handle all legislative questions that may effect the particular industry, regarding factories, trades, tariff, taxes, transportation, employers' liability and workmen's compensation, as well as the handling of rate litigation and railroad transportation questions?

9. May a trade association, in cooperation with its members and acting for and in their behalf undertake the promotion of closer relations between the particular industry and the federal and the state departments of government which may have administration of laws affecting the particular industry in any form?



(10)-A. May a trade association collect statistics from each member showing his volume of production, his capacity to produce, the wages paid, the consumption of his product in domestic or foreign trade, and his distribution thereof, specifying the volume of distribution by districts, together with his stock, wholesale or retail?

B. And may such trade association, on receipt of the individual report of each member, compile the information in each report into a consolidated statement whch shows the total volume of production of the membership, its capacity to produce by districts of production, which, in some instances, include a state or less area, the wages by districts of production, the consumption in foreign or domestic trade by districts, the volume of distribution by districts, and the stocks on hand, wholesale and retail, by districts?

C. And if, after compiling the information as aforesaid, the information received from the members as well as the combined information is not given by the association to any other person, may it then file the combined statement with the Secretary of Commerce for distribution by him to the members of the association through the public press or otherwise and to the public generally and to all persons who may be in any way interested in the product of the industry, it being understood that the individual reports for the members should cover either weekly, monthly, quarterly or longer periods as may be deemed desirable by the members, and, when a period is adopted, the report for each member shall cover that period, and the combined report shall be for that period?

(11)-A. May a trade association, at the time it collects the production and distribution statistics above outlined, at the same time have their members report the prices they have received for the products they have sold during the period taken, specifying the volume of each grade, brand,

size, style, or quality, as the case may be, and the price received for the volume so sold in each of the respective districts where the product is sold?

B. And may the association, without making known to any person the individual price reports of any member, consolidate all of the reports into one, and show the average price received for the total volume of each, grade, brand, size, style, or quality, as the case may be, distributed in each district covered by the distribution statistics for the period covered by each individual report?

C. And may the association, after making such compilation, send the compiled report as to average price, as aforesaid, to the Secretary of Commerce, to be by him distributed to the public and to any or all persons who may be interested in the particular industry making the reports?

In order to avoid repeating this question in connection with each one of the activities outlined in the eleven preceding questions, may trade associations engage in any or all of the activities named without violating the law, provided the organization and the activity engaged in are not for the purpose of hiding or concealing some agreement, contract, etc., to actually restrain trade or otherwise violate the anti-trust laws?

As stated in the beginning, I do not ask you to express your views in a form opinion, but it is my hope that you may see your way clear to give me the advice that will enable me to adopt the proper administrative action in undertaking the duties imposed upon the Secretary of Commerce by the organic act creating the Department. It is unnecessary for me to say that the general, unsettled condition regarding the proper provinces of trade associations justifies as early a reply to these inquiries as your other numerous official duties will permit.

Yours Faithfully,
HERBERT HOOVER,
Secretary of Commerce.

OFFICE OF THE ATTORNEY GENERAL.
Washington, D. C., February 8, 1922.

My dear Mr. Secretary:

Your communication of the 3rd instant relating to the practices in which trade associations may lawfully engage was received. I recognize the force of your able discussion of the subject, and after careful consideration of the several activities which you suggest can be exercised lawfully, I beg to say:

With reference to the first paragraph, there is no apparent objection to a standard system of cost accounting, but I think associations should be warned to guard against uniform cost as to any item of expense. For illustration, a strong effort has been made by some lumber associations to take as a basis for estimating costs of production a uniform charge for stumpage. Of course the cost of the timber in the tree to the different manufacturers who own their timber in the woods greatly varies; and as to each it should be charged at its actual cost. It is as clearly a violation of the law to agree upon the cost of an item that constitutes a substantial part of the total cost price when its cost actually varies, as to agree upon the sales price, because the sales price is substantially affected by such agreement. It has been ascertained that the members of one association go so far as to fix a uniform cost price, leaving to each member to determine what per cent profit he will add, thus eliminating entirely competition in so far as affected by the cost of production.

Furthermore, I have serious doubts about the advisability of the latter part of the sixth paragraph. I can see no objection to cooperative advertising designed to extend the markets of the particular article produced or handled by the members of an association, but when the several producers or dealers use uniform trade labels, designs and trademarks it seems to me the inevitable result would be a uniformity of price. Where two competing articles are advertised in precisely the same way and bear exactly the same label or trademark, it certainly would be difficult for one to be sold at a higher price than the other, although its quality may be superior. In a way this is illustrated in the cement industry. There a standard of quality has been adopted. That is, it is necessary for all cement to comply with a certain standard, but in practice no manufacturer undertakes to make, or at least no one advertises that he does make, a grade of cement superior to that standard. The result is that there is no competition in the sale of cement so far as quality is concerned. It seems to me therefore that it would be well to eliminate the latter clause in paragraph six, to wit, "and may the association engage in such form of promotion by furnishing trade labels, designs and trade-marks for the use of its individual members?"

I can now see nothing illegal in the exercise of the other activities mentioned, **provided always** that whatever is done is not used as a scheme or device to curtail production or enhance prices, and does not have the effect of supressing competition. It is impossible to determine in advance just what the effect of a plan when put into actual operation may be. This is especially true with reference to trade associations, whose members are vitally interested in advancing or, as they term it, stabilizing prices, and who through the medium of the associations are brought into personal contact with each other. Therefore the expression of the view that the things enumerated by you, with the exceptions stated, may be done lawfully is only tenative; and if in the actual practice of any of them it shall develop that competition is suppressed or prices are materially enhanced, this Department must treat such a practice as it treats any other one which is violative of the Anti-Trust Act.

Yours sincerely,
H. M. DAUGHERTY,
Attorney General.

DEPARTMENT OF COMMERCE,
Office of the Secretary.
Washington, February 9, 1922.

My dear Mr. Attorney General:

I have your letter of the eighth instant, in reply to my letter to you of February 3, 1922, in which I made informal inquiry as to the legality of certain activities of trade associations enumerated in eleven questions. It is very pleasing to me to note that our views regarding these matters are in such close harmony.

Your observations regarding the last clause in question (6) in my letter are wholly sound, based on the language of that clause. It was not, however, my idea that each constituent member of a trade association would use a community trade-mark on his product, i. e., the same trade-mark that was used by every other member of the association, and, therefore, the last clause in that question was unhappily worded. The question really relates to trade promotion through cooperative advertising, in which certain trade slogans are used, such as, "Made in Grand Rapids," which was adopted by the furniture manufacturers at that furniture center. Generally, activities covered in question (6) are

This insert was produced complete by the Frederick C. Mathews Company, Detroit, Michigan

conducted by a trade association in a given local community. An organization at Chicago advertises for its entire membership, which includes every line of commercial endeavor in Chicago, that the City is the great central market. It is cooperative advertising of this class that tends to promote trade extension in given lines or collected lines of industry. Certain of the trade associations, however, do devise trade-marks, not for use by all members, but for individual members. It is a well-known fact that when some manufacturer or producer is fortunate enough to select a trade-mark that appeals to the public, it becomes a great aid in selling his commodity and, as a result, it is well advertised until it becomes a household word. Other producers or manufacturers of the same kind of an article, in order to take advantage of this situation, will devise a trade-name or trade-mark as near to that of the successful competitor as he thinks he can go and still escape suit under the trade-mark or unfair competition laws. The activities of a trade association regarding trade-marks to which I referred in my letter of the third relate to the straightening out of instances of unfair competition or infringement as between the members by undertaking to design trade-marks for the individual members of the association making the same product that would absolutely prevent confusion on the part of the public as to the producer or manufacturer of the given article and, at the same time, remove all claim of infringement or unfair competition. In other words, the trade-mark activity referred to was that of making the trade-marks of each individual member distinctive instead of common. You may, therefore, consider the part of my question (6) referred to in your letter as eliminated from the question, and that the question was really intended to cover the matters stated herein. With this explanation, I feel sure you will agree with me that our views on the matters presented are in complete accord.

Yours faithfully,
HERBERT HOOVER,
Secretary of Commerce.

Removal of Garlic Flavor from Milk and Cream

By S. Henry Ayers, Bacteriologist, and W. T. Johnson, Jr., Scientific Assistant, Dairy Division

IT IS a well-known fact that when cows eat wild onion or garlic within four hours before milking there is imparted to their milk a very disagreeable flavor and odor. This flavor is not only unpleasant but it lowers the commercial value of the milk. Any method, therefore, which will remove this flavor and odor should be of interest to dairymen.

The Experimental Milk.

In all our experiments milk with a strong onion flavor was used. The milk was prepared by feeding a cow with three-fourths of a pound of wild onion or garlic 20 minutes before milking, and we believe that the milk so obtained has as strong a flavor, probably stronger, than any commercial milk so tainted.

Description of Process.

Briefly stated, the process which we have used for removing onion or garlic flavor from milk consists in blowing air through milk which is heated to at least 145 degrees F. The apparatus used in our work is shown in figure 1. It consists of a round, open-top tin tank, A, of about 4 gallons capacity, surrounded by a

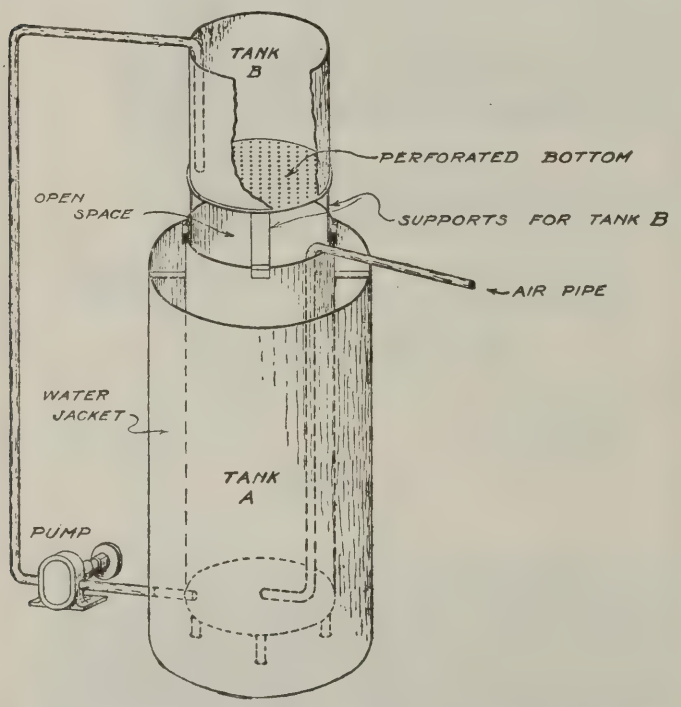

Fig. 1.—Apparatus for removing wild onion or garlic flavor from milk or cream.

water jacket. Supported above tank A is a second tank, B. Tank B has a perforated bottom, the holes being about one thirty-second of an inch in diameter, placed at a distance of about one-half inch apart. This tank stands about 3 inches above tank A, and is supported by four legs. There is left, therefore, an open space between the two tanks through which the air escapes after its passage through the milk. An air pipe extends to within one-half inch of the bottom of tank A. A pump is also provided with connections to both tanks.

The method for removing onion or garlic flavors is as follows: Milk is placed in tank A and heated to 145 degrees F. by means of hot water in the water jacket. During the heating the milk is agitated by mechanical means. It is possible that a slight agitation by air would act as well as a mechanical stirrer, but if such agitation is too violent it may churn the fat in the cold milk. When the temperature has reached 145 degrees F. air under pressure is blown into the milk through the air pipe, which extends nearly to the bottom of tank A. This air causes a violent agitation of the milk. When the air is turned on, the milk pump is started and milk is pumped from tank A to tank B, from which it flows through the perforated bottom and returns to tank A in fine streams after the manner of rain. The pumping is continued throughout the blowing process. The principal object of tank B is to cause milk to drop into tank A in such manner as to destroy the layer of foam which forms on the milk which is being treated with air in the lower tank. This method of allowing the milk to fall in fine streams also aids in aeration and therefore helps in the removal of the onion or garlic flavor.

Air was obtained from the laboratory pressure air line, and about one-fifth of a cubic foot of air per gallon of milk per minute was used.

Process most Satisfactory at 145 Degrees F.

In developing this process a large number of experiments were performed, using various temperatures. It was found that some of the onion or garlic flavor could be removed by blowing cold milk, but it was impossible to remove it entirely in any length of time which would be practical for commercial use. In one experiment milk with a strong onion flavor was blown for two hours at a temperature ranging from 50 to 68 degrees F. and the flavor was not removed. The temperature was then raised to 145 degrees F. and after five minutes blowing the onion flavor was entirely removed. It was also found that when cold milk is violently agitated by air the fat churns, and when the milk is subsequently heated, followed by cooling and bottling, as in pasteurization, a thin layer of butterfat forms on the surface of the bottled milk. When milk was blown at temperatures from 70 to 100 degrees F. a layer of melted fat formed in some cases during the blowing process. This was never observed when the temperature of the milk during blowing was 140 degrees F. or above.

To meet the nation-wide demand for Swift's Quality Gelatines

In less than two years, superior quality has won for Swift's Gelatins an enviable place on the market. The demand is nation-wide; it can not be met with one branch, or two, or three.

Today, Swift & Company is making shipments from *twelve* different points!

Stocks in 12 cities now.

New York, Chicago, Cleveland, Cincinnati, Philadelphia, Minneapolis, St. Louis, Baltimore, Atlanta, Buffalo, Portland, and San Francisco — the nearest of these cities is your source of supply when you buy Swift & Company's Quality Gelatins.

It is probable that more of our warehouses will have to be supplied in the very near future.

Superior quality makes demand

Swift & Company's Gelatins are distinguished by purity, freedom from taste and odor, good strength, unusual clarity and dependable uniformity. They merit the same confidence that the other products of this company hold.

The prices are most reasonable.

Whether you use gelatine in large or small quantities you are invited to write for samples and quotations on our different grades. Or, upon request, one of our representatives will call. Address Dept. 6 B.

THE ASSOCIATION OF ICE CREAM SUPPLY MEN · MEMBER

Results of Experiments at Various Temperatures.

Since the best results were obtained when the milk was treated at temperatures above 140 degrees F., the results of a few experiments on milk and cream which show the length of time required to remove the onion or garlic flavor have been tabulated in Table 1. In experiments Nos. 1 and 2 the milk was blown without the use of the upper tank B, while in experiments Nos. 3 and 5, at the same temperature, tank B was used. The same volume of air, about one-fifth of a cubic foot per gallon per minute, was used in these experiments. It will be seen, however, that the onion flavor was removed more quickly in experiments 3 and 5 when tank B was used. It is probable that the milk falling from tank B in fine streams breaks up the layer of foam on the milk in tank A and therefore aids in the escape of the onion flavor, which is volatile. The milk also is probably aerated when falling in this manner.

Experiment No. 4 shows that the onion flavor in milk is removed more quickly when the milk is heated to 160 degrees F. There is produced, however, at this temperature a cooked taste and the cream line is reduced to a greater extent than when the milk is heated and blown at 145 degrees F. When milk was blown at 145 degrees F. the experiments showed that there was about a 50 per cent reduction in the cream line. The effect on the cream line will vary with the amount of agitation of the milk and the length of the blowing period.

It is seen from the table that the onion or garlic flavor was removed entirely from milk at the temperatures given in from 30 to 60 minutes. It is evident, of course, that the length of the blowing period will depend upon the strength of the flavor in the milk. In one experiment not shown in Table 1 the flavor was removed by five minutes blowing. In this case, however, the onion or garlic flavor was not strong in the milk before treatment.

Removing the Flavor from Cream.

In order to remove the flavor from cream it was found that in general a slightly longer blowing period was required than in the case of milk. The results of four experiments with 30 per cent cream are shown in Table 1. Here again the results show that the onion or garlic flavor may be removed more quickly at 160 degrees F. than at 140 or 145 degrees F. It would probably be possible to use 160 degrees F. when the cream is to be used for butter making, but for direct consumption the cooked taste produced by long heating at 160 degrees F. is undesirable.

Evaporation.

When milk or cream is treated by this process it was found that there is a loss by evaporation which amounts to 2 or 3 per cent. Therefore it is advisable to use the minimum amount of air which will remove the onion or garlic flavor.

Commercial Use of the Process.

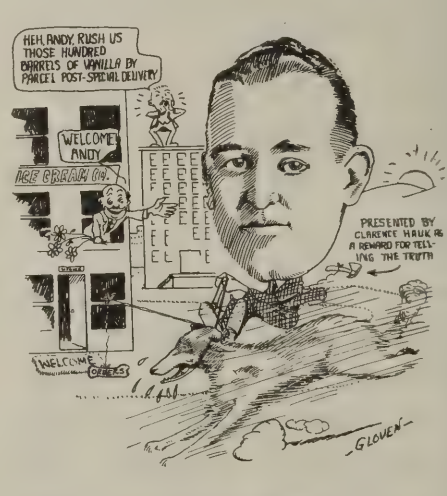
The application of this process on a commercial scale would be simple, as an ordinary tank could be used with another tank with a perforated bottom supported above it. The size of the air blower necessary to supply air will depend upon the amount of milk to be blown and the depth of the milk, since air has to be forced to the bottom of the tank. It is desirable that the air be filtered and washed before its passage into the milk, in order to remove dust.

Any of the manufacturers of air blowers will determine the size necessary when supplied with the proper data; that is to say, the amount of air pressure which the blower must provide.

The experiments indicate that onion or garlic flavor may be removed on a commercial scale from milk and cream by the simple process which has been described. It is believed that the milk or cream for direct consumption should be heated and blown at 145 degrees F. in order to obtain the best results, but the temperature used and the method of application of the process will depend upon the particular needs of the creamery operator.

TEXAS LONGHORNS

President—J. R. KRAMER, Creamery Package Mfg. Co., Dallas, Texas.

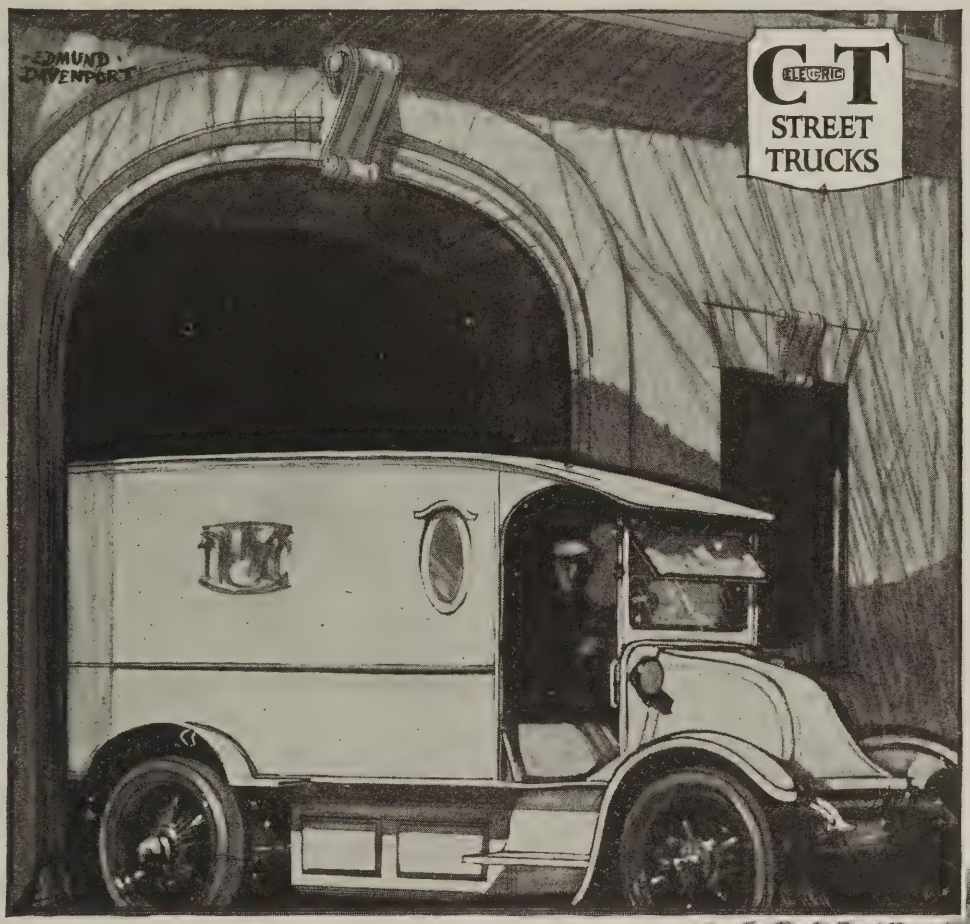


Secretary—J. B. HUFF, Prall-Huff Co., Fort Worth, Texas.

Dear Review:—Your letter asking my opinion of general conditions at present and prospects for the future of the ice cream industry in my territory caught up with me in the wilds of Oklahoma after a long and breathless chase.

You know every Wolf Hound has to be a good runner, but they have some rum-runners down this way that have the world beat for speed. A pack of them had chased me unsuccessfully through three counties and I was about ready to give up the chase when they spied Clarence Hauk drinking a glass of milk. This diverted their attention for a moment, and gave me an opportunity to escape. I had only begun to breathe more freely when the postman caught up with me and handed me your letter.

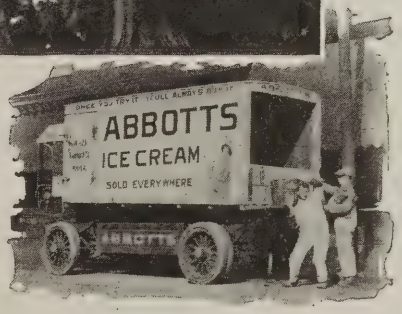
As soon as I opened it I lost my breath again on account of that first line. I wish you wouldn't write such startling first lines and send them to a fellow unexpectedly. "We want to draw on you—." It's almost as bad as "Please Remit," but anyhow, after I got my breath for the second time, I decided to slip you an earful of glad tidings about the way the ice cream season is starting off down here.



A few months ago a salesman traveling in this country could hear the same sad story from Miami, Fla. to El Paso. Tex. He never walked into an ice cream manufacturer's office without expecting to hear a long, lingering tale of woe, and was seldom, if ever, disappointed.

I'm telling you, Mr. Olsen, (and you know one Swede wouldn't lie to another) that things are decidedly different now. Every ice cream man I call on now days has a grin on his face like a hungry tom cat turned loose in a bird store. He slips you the glad hand and wants to know if you will send him some vanilla right away by aeroplane—says the railroads can't bring it fast enough lately.

All kidding aside, I believe I can say with the approbation of every Wolf Hound, White Cap and Dixie Flyer that it's going to be a whale of a year for the ice cream industry if things keep on as they are now and the weather-man sticks with us.



Tri-fraternally yours,
"2a" Anderson.

FROM every angle of electric truck haulage and delivery, the C-T truck is a *saving* investment.

For a truck manufactured throughout in our own plant, according to the highest standards of design and construction as C-T is, the price is exceedingly low because efficient quantity production makes it so.

Thus quality, always obtained at a high price, is brought within the reach of the ice cream manufacturer or dealer who has only a modest sum to spend.

One of Abbott's C-T Ice Cream Trucks, 5-ton capacity

Records of C-T users show that this quality, rightly priced, returns large savings in low operating cost year after year.

That is why the careful buyer, demanding a full return from every dollar invested, buys C-T Electrics.

There is one sure way to determine whether C-T Electric Trucks will return you a profitable saving on your present delivery costs. Give us the opportunity to make a business-like investigation. It will cost you nothing but a small amount of your time. *Write us today.*

All capacities, Bantam (½-ton) to 5-tons.

ELIMINATING THE GRASSY FLAVOR IN ICE CREAM.

(Concluded from page 12)

going through the pasture would knock the pollen from the plant onto the udder and during the milking process this pollen fell into the milk bucket, thus giving the flavor.

* * *

Start With the Farmer.

The trouble that your reader is having is a more or less common one, and one which in a case of a large business is very difficult or impossible to overcome. It is very well known that when cows are put from dry feed on to pasture, the milk takes on a more or less pasture or grassy flavor. It is usually noticed that this flavor is very much more pronounced in the milk from some patrons than others. I remember very well when a youngster at home, that nearly every year when our cows first went out to pasture, the cream which was served on the daily dish of oatmeal had such a pronounced flavor as to make it almost impossible for me to eat it. As your subscriber suggests, it is very strong and approaching sourness.

While I know of no experimental data to bear this out, I have always attributed the difference in the flavor of the milk when the cows are put on grass, to the fact that in some pastures cows get hold of some noxious weed which causes the flavor with which your subscriber is having trouble. I do not believe that ordinary pasture grass while it may impart a so-called grassy flavor to the milk, will impart enough flavor to be bothersome. If this were the case it would be almost impossible to use any milk from cows when put out to pasture.

The only practical way that I know of to overcome this trouble is to start at the farm and leave the cows on grass only for a few hours a day, particularly to start with; taking them in sometime before milking and feeding some hay if necessary. It is well understood that certain feeds fed just before or during milking, will impart their flavor to the milk while if fed some time before milking the flavor will not come thru into the milk. Unfortunately no data is available as yet to indicate how brief a time can elapse between the feeding of such a feed and milking time and not have the flavor of the feed appear in the milk. It is probable that this would vary a great deal with different cows.

Thus, it can be seen that the creamery or station receiving the milk or cream from the farmer is the one that must locate the farmer or farmers that deliver the cream or milk with the objectionable flavor and then work with the farmer or farmers to correct it. It is very probable that your subscriber does not buy his cream direct from the farmer and is, therefore, decidedly up against it unless he can get the people from whom he does buy his cream to take the necessary action. It is quite probable that the trouble will be found in the milk or cream of only perhaps two patrons in fifty or a hundred.

* * *

Take Extra Precautions in Warm Weather.

Regarding grass and acid flavor in milk when cows first go to pasture, will say that I have often noted a peculiar "feedy" or "grassy" flavor which I suppose is what your inquirer refers to. As to the sour flavor mentioned, I think it real in some cases, and not so in others. Sometimes this peculiar grassy flavor also gives a peculiar sour taste, even in perfectly sweet milk. In other cases I believe the sour flavor is due to acid developments, since with the warmer days which come on or about the time the cows go to pasture, many producers do not take the necessary added precautions to prevent bacterial growth in milk with the increased acid.

I have made no particular studies as to how to overcome this flavor but I doubt if it can be successfully prevented unless the cows be taken off of pasture several hours before milking which would not be practical on most farms.

* * *

Grade Cream Carefully.

I expect your correspondent has reference to the peculiar flavor that usually develops in the milk when the cows are changed from dry feed to grass. I know of no way in which this can be overcome and for ice cream purposes I would suggest that the cream is graded very carefully and that such cream will not be used. You will at times note that cream containing only about .2% of acidity may have a peculiar sour odor and flavor. This difficulty is often noticed during the early summer. I think you will find this due to the fact that some of the cream mixed in with it contained a higher degree of acidity. It had just reached the turning point, although the whole lot of cream after it is all mixed will test comparatively low in acidity. There is no method by which this flavor can be destroyed. The only thing is to be careful in grading the cream used for ice cream making.

* * *

Permit Volatilization of Odors.

At this particular time of the year when the cows are placed on green grass after having been housed for a period of time and fed dry feed the milk does develop this peculiar flavor as described in your letter. It is commonly termed "a grass flavor," which is primarily due to the condition of the grass at this season, especially so if a heavy rain fall is experienced in the spring. This undesirable flavor is transmitted from the milk into the cream upon separation and in turn develops in the butter or ice cream, depending upon the product manufactured. As your letter states this is particularly true when the grass is growing very rank or fast and when the blades contain much water or moisture. We have experienced the same trouble when our cattle are placed on blue grass.

As a means of overcoming this serious defect I would recommend a thorough pasteurization of all milk if the product is sold in the form of whole milk and the pasteurization of all cream if the product is to be utilized in the manufacture of creamery butter and the pasteurization of the ice cream mix if the milk or cream is to be manufactured into ice cream. If such can be arranged the doors of the pasteurizer should remain open during the pasteurization process which will facilitate the volatilization of these undesirable flavors. I am confident that this will assist greatly in analyzing this problem.

* * *

Eliminate by Proper Pasteurization and Cooling.

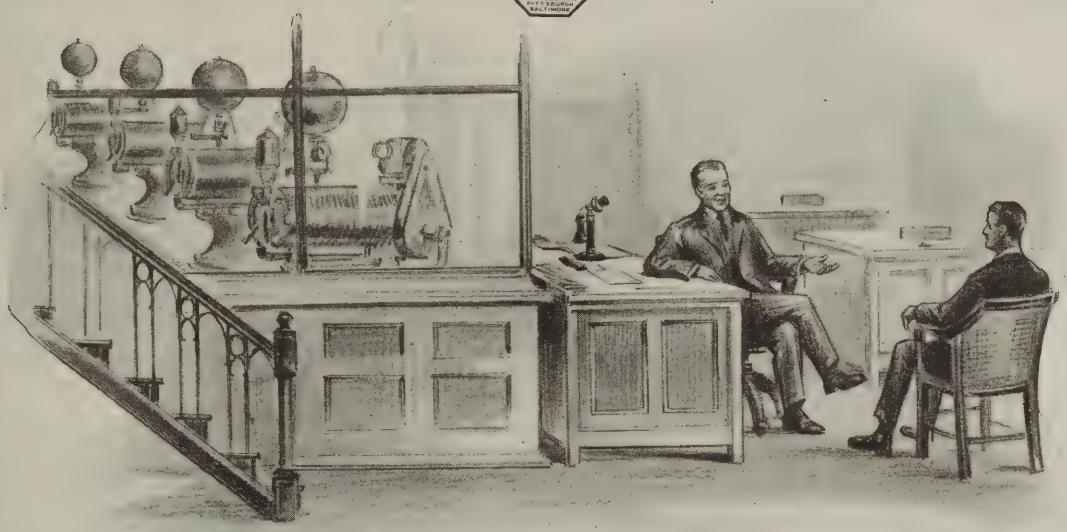
About the only complaints that we ever have on our butter is in the spring when feed is changing from hay to grass. We get complaints from customers that we have written to in reference to this every year, and their complaint is, "you are using too much color," when the fact of the matter is we haven't used any color for several weeks prior to the time of their writing, and we have gotten so we wrote our customers before they have an opportunity to write us so that when a consumer complains of the color they can simply tell them it's nature's color and it's impossible for us to bleach it out.

Now, this is leading up to an answer to your question. The same conditions and processes of nature that causes the extremely high color in the fresh grass causes the taste in cream, which is assumed by some to be sour. It is an acid in the grass and does produce a sour flavor, even though a chemical analysis will disclose no acidity whatever. On account of the cool weather the grass grew very rank and the cattle were unable to keep it closely cropped and this rank growth of course contained more of this acid and produced an even higher color than normal and, unless carefully handled, a correspondingly higher degree of acidity.

Now I am glad to say that we have two men working for us, who are students, and they are glad to work with me on this subject. We try by different degrees of pasteurization and cooling to overcome this, and I think we do to a certain extent. I could go on elaborating for a long time, but I could not tell you any more than I have already told you, as I think this covers the entire subject. Now don't quote me as an authority on this; this is the conclusion that I have come to from actual experience.

* * *

In regard to the flavor of ice cream at this time of the year, I will frankly admit that I do not know what causes it, but believe that it is due to a bacterial infection which has its natural habitat on the green grass.



This is a similar case to the rag weed flavor of milk. It was formerly believed that milk with a rag weed flavor was due to the cow eating rag weeds, but we have proven that the rag weed flavor is due to a bacterial infection which gets on the cow from the rag weed and in that way finds its way into the milk pail. If the milk is cooled quickly after it has been drawn so that it will prohibit the growth, the undesirable flavor will be lessened.

* * *

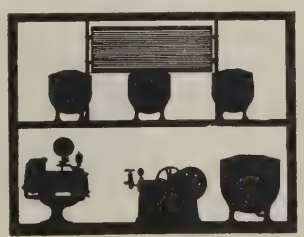
Take Cows Off Grass Four Hours Before Milking.

I have never had such difficulty except in the early spring when the cows are first turned on pasture, and especially if there is some rye pasture being used. It seems that spring rye will give sort of an acid flavor to milk and cream, and this is somewhat undesirable. There are also certain grasses which will tend to do this. As far as I know the only remedy is to prevent the cows getting such material within four hours before milking. In other words, if the cows are turned on

THE C-B-W CALENDAR

To New Ice Cream Companies

who are just starting in the business



"Fifteen years ago, boy, we were just where you are—just holding our breath, you might say, not knowing whether we were going at things quite right or not, and placing considerable dependence upon the advice and instructions of others.

"We had some narrow escapes, learning this ice cream business. Some employees were found undependable. It would have been better to not have heard some of the advice we followed; and some of the worthless machinery we put in wasted as much money for us as you've needed to start in the game now.

"Let me say right here though, that machinery houses in general, by their progressiveness, have pulled the industry along, advancing it years beyond where it would have been otherwise.

"Our progress has been very much helped by the machinery house with whom we have been dealing for the past ten years. I might say, boy, that here is a vital point to your success. Get to dealing with a dependable equipment house. They'll help you surprisingly. Whereas, if you buy here, there, and everywhere, you're going to have lots of trouble, a crop of adjustments and unsatisfactory service all the time.

"We always get quality equipment from CHERRY-BASSETT-WINNER COMPANY. Knowing that we will get best quality stuff saves a lot of worry for us and then whenever we add a new machine to our plant, we get intelligent service and the benefit of their salesman's experience. You know travelling around as they do, these fellows accumulate a lot of up-to-the-minute knowledge which can be of much value to all of us, especially a beginner like you.

"Why don't you get in touch with this house? I'm sure you stand a good chance to gain much and a slim chance of losing anything. Look their catalog over anyway."

ACCURATE AND INSTANTANEOUS TESTING OF OVERRUN IS THE RESULT OF A GOOD TESTER.

the pasture directly after milking and taken in three or four hours previous to the next milking, you will reduce this difficulty to a minimum.

* * *

Make Feeding Change Gradually.

The peculiar flavor which your subscriber observes in milk at this time of the year is no doubt due to the tender, rapidly growing pasture. This observation is quite a common experience.

As far as I know, the only way to prevent this flavor is to allow the pasture to become more mature, and in making a change from dry feed to pasture, the change should be made gradually.

To eliminate this flavor after the milk has once been produced is quite difficult. In this connection, the aeration of the hot milk after it is pasteurized may be of some benefit, although it will not remove this flavor entirely.
